Acetophenone condenses with phenylhydrazine but does not combine with sodium hydrogen sulphite. It results from the distillation of a mixture of dry calcium acetate and benzoate but is best prepared by condensing benzene and acetyl chloride with aluminium or ferric chloride in carbon disulphide. It has anaesthetic and soporific properties and under the name of hypnone has been used as a drug to induce sleep. With hydroxylamine it condenses to acetophenoneoxime, $C_6H_5C(CH_3):NOH$, which, under the influence of phosphorus pentachloride in ether is converted into the isomeric acetanilide, $C_6H_5NH.CO\,CH_3$, this transformation being an example of the so-called Beckmann change which occurs with ketone oximes in general. *p*-Aminoacetophenone also has anaesthetic properties, whereas the condensation product of acetophenone and phenetidine is an antipyretic substance. On adding sodium to acetophenone dissolved in ethyl acetate the sodium derivative of benzoylacetone is produced from which benzoylacetone, $C_6H_5CO.CH_2CO\,CH_3$ is obtained by acidification, this condensation being a typical example of the Claisen reaction.

**ACETYLENE** is a colourless gaseous compound of 7.74% of hydrogen and 92.24% of carbon, used as a fuel both in the oxy acetylene process for the welding and cutting of metals and also for isolated or independent lights. It is the simplest of all unsaturated organic compounds and has the composition HC CH (*see* CHEMISTRY: *Organic*). It changes to a colourless transparent liquid under a pressure of 61.6 atmospheres at the critical temperature of 36.5°C. At a pressure slightly above 1 atmosphere and below −81.8°C. the liquid contracts and [illegible] crystals melt at −81.8°C. at a pressure above 1 atmosphere and sublime at −83.6°C. at 1 atmosphere.

Acetylene is an endothermic compound, which means that heat is absorbed in its formation from carbon and hydrogen and that it can decompose to the elements with liberation of heat. For this reason liquid and solid acetylene and gaseous acetylene at a pressure above about 2 atmospheres are violently explosive when subject to shock, spark or sudden heating even in the absence of oxygen. The sale or transportation of acetylene in these forms is generally prohibited.

The density of gaseous acetylene is 0.9056 (air = 1) and its mean coefficient of expansion between 0°C. and 100°C. is 0.003738 (air is 0.003671). Because it has a greater density and a higher energy content than other common fuel gases it gives a greater heating or lighting effect. The density of liquid acetylene is 0.613 at −80°C. and its coefficient of expansion is 0.0024.

Acetylene is very soluble in certain liquids which contain oxygen or nitrogen and do not contain acidic hydrogen; in other classes of liquids the solubility is much lower. This behaviour has been attributed to an electrostatic attraction between a hydrogen atom in acetylene and an atom of oxygen or nitrogen in the solvent. The approximate number of volumes of acetylene (calculated at 25°C.) soluble in 1 volume of some typical liquids at 1 atmosphere is as follows:

| *Solvent* | *Volumes* | *Temp. °C.* | *Solvent* | *Volumes* | *Temp. °C.* |
|---|---|---|---|---|---|
| Acetaldehyde | 60 | −10 | Benzene | 4 | 20 |
| Methyl acetate | 52 | −10 | Paraffin oil | 1.5 | 20 |
| Dimethyl formamide | 37 | 20 | Acetic acid | 6 | 20 |
| Acetone | 18 | 18 | Ethyl alcohol | 6 | 20 |
| Dioxane | 16 | 25 | Water | 1.15 | 15 |

The solubility of acetylene in all solvents increases with decreasing temperature and increasing pressure. The solubility is of interest because acetylene must be stored and transported as a solution under pressure (*see* below) and because it is possible to use selective solvents for the separation of acetylene from industrial mixed gases (*see* below). Since the solubility of acetylene in water at moderate pressure is limited, water and aqueous solutions can be used as washing or confining liquids in generating plants and gas holders.

**Acetylene from Calcium Carbide.**—In 1945 nearly all acetylene was made from calcium carbide, a compound of calcium and carbon, having the formula $CaC_2$ and therefore containing in its pure state 37.47% carbon. It interacts with water immediately on contact, yielding acetylene and slaked lime: $CaC_2+H_2O\rightarrow Ca(OH)_2+C_2H_2$. Commercial calcium carbide contains about 20% of inert material and ordinarily yields 4.80 cu.ft. of moist acetylene per lb. at 60°F. and 30 in. pressure or the equivalent figure, 300 litres of moist acetylene per kg. at 15° C. and 760 mm. A good grade of calcium carbide has a specific gravity of 2.22 and resembles fine-grained granite or hard limestone in appearance and hardness. The commercial product is broken and screened to lumps of convenient size for different uses, and is packed for transport in air tight steel drums. Since it evolves acetylene slowly when exposed to damp air and rapidly when wetted, calcium carbide is everywhere subject to special regulations for transport and storage.

The industrial production of calcium carbide was initiated in 1892 by T. L. Wilson, a Canadian electrical engineer at Spray, N.C. Its manufacture is conducted on a large scale in most localities where water power is available at low cost, notably in Norway and Sweden, Shawinigan (Quebec) and Niagara. It is made by heating together in the electric furnace a mixture of lime with about 40% of coke or anthracite. The reaction begins at the solid contact surface of lime with carbon and attains an appreciable rate at about 1,700°C., the melting point of a eutectic of lime with calcium carbide in the presence of ordinary impurities. After the reaction is initiated it occurs chiefly between the fused lime in the eutectic and solid carbon. Carbon monoxide is evolved and in modern furnaces is collected as a by-product. The reaction is $CaO+3C\rightarrow CaC_2+CO$. The melting point of the flux of lime and calcium carbide rises until 52% of calcium carbide accumulates, then falls until the mixture containing 68% calcium carbide melts at 1,750°C. or lower, and then again rises towards the melting point of pure calcium carbide, estimated at about 2,300°C. As the temperature approaches this point a decomposition of calcium carbide to calcium and carbon sets in, and this constitutes a limiting factor, which prevents the formation of pure calcium carbide in this way. In the United States, it has been found most economical to stop the operation when the calcium carbide content reaches 78–80%.

Acetylene is obtained by bringing calcium carbide into contact with water, and innumerable forms of generators have been devised with the object of effecting and controlling the reaction so that acetylene shall be liberated at the desired rate. The reaction is one in which heat is set free, about 166 B.T.U. being released for each cu.ft. of acetylene formed. This heat of reaction may produce localized temperatures high enough to cause polymerization (*q.v.*) of part of the acetylene or even to decompose it to carbon and hydrogen, unless overheating is prevented by the use of excess water. In small generators water commonly drips on the carbide at a rate controlled by a hand-operated valve or by the restriction of the free egress of the evolved gas. In large generators, however, the carbide is either dropped into a large excess of water, or is intermittently submerged by a local excess of water. Provision should be made for the sludge of slaked lime, which is the residue of the decomposition of carbide, to settle down out of close contact with the carbide which has already been decomposed. The sludge is, in most instances, withdrawn at intervals in a semifluid condition. This sludge of calcium hydroxide has little value, and, since about 1935, methods using a minimum of water and yielding a dry powdered calcium hydroxide have received increasing attention. In generators of this type the heat of reaction is used in converting a part of the water into steam, which is later condensed out of the acetylene. It is important that generators liable to be recharged at short intervals be so constructed that air cannot enter the heated interior during discharging and recharging, both because of the danger of ignition and because air is an undesirable impurity in acetylene for some uses.

Acetylene from calcium carbide contains characteristic impurities. Nitrogen, arsenic, sulphur and silicon occur as calcium compounds in carbide, and on treatment with water these yield the corresponding hydrides: ammonia, phosphine, arsine, hydrogen sulphide and silicane. Acetylene generated from modern carbide usually contains less than 0.015% of ammonia, 0.015–0.025% of phosphine, less than 0.01% of hydrogen sulphide, and less than 0.0003% of arsine. At the high temperatures that sometimes

occur in acetylene generators, these simple hydrides may combine with acetylene to yield organic impurities, *e.g.*, divinyl sulphide has been identified as an impurity in acetylene from calcium carbide. High temperatures may also result in the formation of benzene and other aromatic hydrocarbons from acetylene. The crude acetylene from the generator also contains moisture, finely divided solids, air, and sometimes traces of hydrogen and simple aliphatic hydrocarbons. These impurities are minimized in modern practice by selection of suitable materials for carbide manufacture and by careful control of acetylene generation, but some purification of the gas is necessary.

In large acetylene plants the gas may be dried by refrigeration, or by the use of aluminum oxide, or by washing with a solution of calcium chloride. The removal of the phosphine and some of the other hydride impurities is accomplished by oxidation with 85% sulphuric acid or by Granjon's material, a mixture of ferric chloride, ferric oxide, manganese dioxide, mercuric chloride and cupric sulphate. Commercial purifying materials, containing chromic acid or hypochlorites have also been used for this purpose. When the removal of oxygen from acetylene is essential, an aqueous alkaline solution of sodium hydrosulphite containing a small quantity of anthraquinone beta sulphonic acid is employed as a washing liquid. The total removal of all impurities has been accomplished only by liquefaction and distillation of acetylene, and this is considered too hazardous for commercial application. Pure acetylene is a rare laboratory chemical.

Carbides of the other alkali and alkaline earth metals also yield acetylene, but they have disadvantages which debar them from industrial production and use.

**Acetylene from Other Hydrocarbons.**—M. Berthelot in 1862 first identified and named acetylene as a product of the pyrolysis, or thermal decomposition, of other organic compounds. This was the basis of an old laboratory method for the preparation of acetylene, but the method was neglected until petroleum, natural gas, and coke-oven gas became abundant and cheap enough to make the process economically attractive. In Germany during 1940–45 some acetylene was made from gases containing methane. In the United States little acetylene has actually been produced by this method but much research has been done on the manufacture of acetylene from natural gas or from petroleum fractions which are least valuable for other purposes. The method consists of heating an organic compound, usually a gaseous or liquid hydrocarbon, to a temperature of 1,300–1,700° C. for a fraction of a second, cooling the resulting gas mixture below 400° C. with extreme rapidity, and separating the acetylene from the other gaseous products. The heating may be accomplished by an electric discharge, by partial combustion of the raw material or by contact with a heated surface. It must be of very short duration because acetylene decomposes to carbon and hydrogen, with which it is in equilibrium in this temperature range. The rapid cooling is usually accomplished by expansion and is essential to prevent conversion of acetylene to aromatic hydrocarbons, which occurs over most of the cooling range. The power consumption in the manufacture of acetylene by pyrolysis, even with electrical heating, is estimated to be somewhat less than in the production of acetylene from carbide.

Acetylene commonly comprises about 5–25% of the mixed gases produced by this method, and its separation is the most expensive step in the process. The small proportion of hydrocarbons containing four or more carbon atoms can be removed by refrigeration or extracted by cold solvents. Traces of more reactive hydrocarbons such as butadiene, methyl acetylene, diacetylene and some olefins can be removed by reaction with sulphuric or phosphoric acid or aluminum chloride. Small quantities of acidic impurities such as hydrogen sulphide, hydrogen cyanide and carbon dioxide can be eliminated by an alkaline wash. Acetylene then is usually extracted by a selective solvent from the remaining mixture containing methane, ethane, ethylene and much hydrogen. A number of good solvents for acetylene have been proposed for this use, but most of them dissolve an undesirably high proportion of ethylene. In Germany water has been used as a solvent to extract acetylene from a gas mixture under a pressure of about 20 atmospheres. Water is especially effective for the separation of acetylene from ethylene at high pressures because of the comparatively low solubility of ethylene. The solubility of acetylene in water increases approximately in proportion to the partial pressure of acetylene up to 5 atmospheres and to a slightly lesser extent at still higher pressures. Further research on the pyrolytic method and the recovery of acetylene from mixed gases may make this procedure a serious competitor of the carbide process.

**Dissolved Acetylene.**—The relatively large solubility of acetylene in acetone was first observed by G. Claude and A. Hess in 1897 who stated in the *Compies Rendus* of that year that the solubility was also very nearly proportional to the pressure, being about 300 volumes at a pressure of 12 atmospheres. They pointed out that the coefficient of expansion of the solution in acetone was very much lower than that of liquid acetylene and, moreover, that the solution did not explode when a wire in it was raised to bright redness. Their observations led ultimately to the development of the present method of supplying acetylene in portable steel cylinders in which it is safely stored under pressure as a solution in acetone. Acetone increases in volume by 4.4% for each atmosphere pressure at which it is saturated with acetylene. Consequently acetone in which acetylene is dissolved under an absolute pressure of 16 atmospheres occupies $1+(16\times0.044)$ times its original volume. This pressure was that to which steel cylinders packed with porous material were permitted by law to be charged with acetylene in Great Britain, and the strength and construction of the cylinders was also specified by law. Similar regulations were enforced in other countries. Since the volume of the acetone solution varies with the amount of acetylene dissolved, it is obvious that the cylinders in use must be only partially filled with the liquid, the remaining space being occupied by compressed gaseous acetylene. Such compressed free acetylene would be liable to explode if the cylinder were exposed to great heat or shock but this risk is avoided by first filling the cylinder with inert porous material the interstices in which will be sufficiently small to prevent any explosion from spreading beyond the point at which it is initiated. Various porous materials have been used for this purpose, *e.g.*, dried clay, [illegible] brick, infusorial earth, kieselguhr and charcoal, singly or [illegible] with or without a binder. The porous material generally preferred is the vegetable fibre kapok, the resilient properties of which cause it to be evenly distributed and free from large open spaces. Current practice in 1945 in Great Britain was to pack the cylinder uniformly with kapok until the solid matter of the latter occupied one-fifth of the capacity of the cylinder, thus leaving four-fifths as interstices in the kapok packing. The acetone is run in to fill a further two-fifths, leaving two-fifths of the internal volume of the cylinder for expansion of the acetone on charging with acetylene and any subsequent exposure to heat. Cylinders of dissolved acetylene thus prepared are convenient and safe. Several proposals and patents for substituting other solvents for acetone in acetylene cylinders had not been applied commercially up to 1945.

**Fuel Uses.**—Acetylene requires 2.5 times its volume of oxygen or 11.95 times its volume of air to effect its complete combustion. It is used for lights in portable lamps, buoys, road signals, isolated premises, etc., but the consumption of acetylene for lighting is small compared to its use in the industrial welding and cutting of metals, for which purposes it is consumed in a blowpipe to which a supply of undiluted oxygen is given from a steel cylinder containing that gas under pressure. In welding, a reducing flame is maintained by using less than the proportion of oxygen required for complete combustion, whereas in cutting metals an excess of oxygen is admitted to oxidize the metal. Since acetylene is an endothermic compound its heat of combustion is greater than that of the constituent carbon and hydrogen. On this account acetylene affords a higher flame temperature than other fuel gases, above 3,000° C. in a correctly designed and operated torch.

**Chemical Uses.**—The simple composition, availability and reactivity of acetylene make it a suitable starting material for the industrial synthesis of several other organic compounds.

Acetaldehyde has been manufactured at Shawinigan, Que., Can ,

and in central Europe since about 1917 by the chemical combination of water with acetylene in the presence of sulphuric acid and mercuric sulphate as catalysts. Much of the acetaldehyde is oxidized to produce acetic acid. Sodium acetate has been made by the Dow Chemical company at Midland, Mich., by the reaction of acetylene on a concentrated aqueous solution of sodium hydroxide with liberation of hydrogen gas. A somewhat related reaction is the formation of acetone from acetylene and steam in the presence of certain alkaline earth on rare earth oxides or hydroxides. Several firms in Europe and the United States manufacture vinylacetate by the chemical addition of acetic acid to acetylene in the presence of a mercuric salt and sulphuric acid or a sulphonic acid. The vinylacetate is used as a constituent of synthetic resins. In a further stage of this reaction the addition of acetic acid to vinylacetate produces ethylidene diacetate. This substance is then decomposed by heating with a catalyst to yield acetaldehyde and acetic anhydride, which is required for the manufacture of cellulose acetate. The reaction of chlorine with acetylene is usually carried out in the presence of gaseous diluents or solvent liquids to prevent explosions. A number of catalysts (*e.g.,* ferric chloride) have been employed to promote the reaction. A mixture of the two possible dichloroethylenes results from the reaction of molar proportions of chlorine with acetylene. The addition of a second molar portion of chlorine yields tetrachloroethane. This substance is converted to trichloroethylene by the loss of hydrogen chloride. These chlorine derivatives of acetylene find use as industrial solvents for oily materials.

The DuPont company of Wilmington, Del., during the period 1930–35, developed a process for the production of a synthetic elastomer or rubber substitute from acetylene. The process was based on the discovery by Dr. J. A. Nieuwland that a saturated solution of cuprous chloride and ammonium chloride containing the solid salts in suspension converted acetylene to a gaseous dimer, vinyl acetylene, $HC{\equiv}C-CH=CH_2$ and a liquid trimer, divinyl acetylene, with smaller proportions of other polymers. Vinyl acetylene was found to add hydrogen chloride in the presence of cuprous chloride to produce the liquid chloroprene, which polymerized to a rubber-like substance, neoprene. This material was extensively used during 1943–46 in the manufacture of tires and tubes and other elastic articles. It is superior to rubber in resistance to heat, oxidation and disintegration by oils. In volume of acetylene consumed and value of the product this was the most important chemical use of acetylene.

A hydrogen atom of acetylene may be replaced by an atom of certain metals to form a class of substances called acetylides. Some of these compounds are useful for the laboratory preparation of compounds containing the ethynyl group, $-C{\equiv}CH$.

**ACETYLENE, IN MEDICINE.** Acetylene, which when pure loses its usual offensive smell, is an anaesthetic when inhaled and was first used as such in 1924. Like ethylene (*q.v.*) it is in the experimental stage at present. Its efficiency is between that of gas-oxygen and ether. It has the advantage that far greater amounts of oxygen can be given with it, up to about 50%, than with ethylene or nitrous oxide. (W. S. S.)

**ACHAEA.** (1) A district on the north coast of the Peloponnesos, between the mountains of Erymanthus and Cyllene and the Corinthian gulf; bounded on the west by Elis, east by Sicyon, sometimes included in Achaea. The 12 cities in its narrow fertile coastland formed a religious confederacy, meeting in Poseidon's sanctuary at Helicé: from this developed the political ACHAEAN LEAGUE (*q.v.*) of Hellenistic times.

(2) Achaea Phthiotis is a district S. of Thessaly (Thessalia) and W. of the Gulf of Pagasae (Vólos). For the origin of the name, and relations between north and south Achaea, *see* ACHAEANS.

(3) "Achaea" was the name given by the Romans to the province formed in 140 B.C. for the mainland of Greece south of Thessaly, Epirus and Acarnania, which were included in "Macedonia." Its administrative capital was Corinth (Kórinthos).

(4) Achaea in the middle ages was a principality, formed within the same region after the Latin conquest of the Eastern empire (A.D. 1204): the first prince being William de Champlitte (d. 1209). It survived, with various dismemberments, until 1430 when the last prince, Centurione Zaccaria, ceded the remnant to his son-in-law, Theodorus II, despot of Mistra. In 1460 it was conquered, with the rest of the Morea, by the Turks.

(5) Achaea in modern Greece is the Peloponnesian district (1), mainly engaged in currant growing, the crop being shipped from Patras (Pátrai) and Aegion (Vostitza).

**ACHAEAN LEAGUE,** a confederation of the towns of Achaea in ancient Greece. Isolated on their narrow strips of plain, these towns were exposed to the raids of pirates from the north of the Corinthian gulf. As a protection against such dangers the earliest league of 12 Achaean cities arose. In the 4th century we find it fighting in the Theban wars (368–362 B.C.), against Philip (338) and Antipater (330). Antigonus Gonatas dissolved the league; but by 280 B.C. four towns combined again, and before long the ten surviving cities of Achaea had renewed their federation. Much was due to Aratus (*see* ARATUS OF SICYON) who initiated an expansive policy; in 228 it included Arcadia, Argolis, Corinth (Kórinthos) and Aegina (Aígina).

Aratus probably also organized the new federal constitution. The league embraced city-States which maintained their internal independence and powers of self-government. Only in foreign politics and war was their competence restricted.

The central government was democratic. The legislative powers resided in a popular assembly, meeting at Aegium, in which every member of the league over 30 years of age could speak; each city counted one on a division. Extraordinary assemblies could be convoked in special emergencies. A council of 120 delegates served as a committee for preparing the assembly's programme. The chief magistracy was the *strategia* which combined with an unrestricted command in the field a large measure of civil authority and had practically the sole power of introducing measures before the assembly. The ten *demiourgoi,* who presided over this body, formed a kind of cabinet. Philopoemen (*q.v.*) transferred the seat of assembly from town to town by rotation, and placed dependent communities on an equal footing with their former suzerains.

The league prescribed uniform standards and coinage; it summoned contingents, imposed taxes and fined or coerced refractory members.

The first federal wars were against Macedonia, against Antigonus Gonatas and Aetolia and, with Aetolia, against Demetrius. A greater danger arose (227–223) from the attacks of Cleomenes III. (*q.v.*). Owing to Aratus's irresolute generalship the indolence of the burghers and the inadequacy of its troops the league lost much of its territory. The assembly negotiated with Antigonus Doson, who recovered the lost districts but retained Corinth for himself (223–221). When Philip V. came to the rescue against the Aetolians he annexed much of the Peloponnese. Under Philopoemen the league, with a reorganized army, routed the Aetolians (210) and Spartans (207, 201). After their neutrality during the Macedonian War the Roman general, T. Quintius Flamininus, restored their lost possessions, bringing the Peloponnese under Achaean control. In 150 B.C. the league, in defiance of Rome, attacked Sparta. The federal troops were routed near Corinth by L. Mummius Achaicus (146). The Romans now dissolved the league, and took measures to isolate the communities. Augustus instituted an Achaean synod comprising the dependent cities of Peloponnese and central Greece.

The chief defect of the Achaean league lay in its lack of provision for securing efficient armies and regular payment of imposts, and for dealing with disaffected members. It is the glory of the league, however, to have combined city autonomy with an organized central administration, and in this way to have postponed the entire destruction of Greek liberty for over a century. (*See* ROME: *Ancient History.*)

**ACHAEANS.** The name Achaeans is used in the Homeric poems in much the same sense as that in which the name Hellenes came to be used in later times. To Homer the Hellenes were a small tribe in Southern Thessaly (*Il.* ii. 684), but from the 8th century onwards the name became a general designation for all Greek-speaking peoples. Whether the name Achaeans was quite so general in its application is still a matter of doubt, but for practical purposes we may regard it as parallel. According to the traditional genealogies Achaeus was the son of Xuthus, son of Hellen.

The name has been connected with that of the Germanic tribe, Ingaevones, a connection that is possible but, perhaps, not very convincing. No light is thrown by it upon the meaning of the name. The Achaeans were a Greek-speaking people, but whether their dialect was Aeolic, Ionic or of the Arcadian type is a question that cannot yet be decided. The Homeric poems are in an artificial literary dialect.

The exact relationship between the Achaeans and Mycenaean culture is still a matter of doubt. The view held by Sir William Ridgeway was that the Achaeans were invaders from the north, a people of northern characteristics, of the fair-haired, grey-eyed type, bringing to Greece a civilization of Danubian origin distinguished by the use of iron, similar to the Hallstatt and Villanova cultures. The former inhabitants were, in his view, of a short, dark Mediterranean type, but Greek-speaking. It was the Achaeans who, according to this view, brought the *labialising* dialects to Greece.

The view more generally held, however, has been that the Mycenaean peoples were not Greek-speaking. The question depends to some extent upon another: What was the language spoken by the Minoan peoples of Crete, of whose culture the Mycenaean was an offshoot? There is no real evidence that the Minoans spoke Greek, or even an Indo-European language at all, and indeed there are many considerations that point to the conclusion that they did not.

A third and more recent view is that the Greek-speaking peoples came to Greece in three separate waves, Ionian, Achaean and Dorian, the first invasion occurring about the 17th century B.C. The Mycenaean civilization was an Achaean civilization, Greek-speaking, and differing in certain notable respects, for example, in dress, from the Minoan. The Greek invaders subdued a previous non-Greek population and first destroyed the Minoan civilization, afterwards reconstituting it, mingled with northern elements, their advent having much the same effect as the barbarian conquest of the Roman empire.

The facts hitherto known are these. There had existed an early population of Greece having a close connection with Anatolia. A large number of place names occur throughout the Greek mainland as well as in Macedonia, Epirus and Thrace which are paralleled in Asia Minor, notably those in *-νθος* and *=σσος*. These are generally regarded as being non-Indo-European and therefore non-Greek. The Greeks were aware of the existence of earlier inhabitants of their country and the Aegean islands, whom they called by the general name of Pelasgians (*q.v.*), distinguishing, however, Leleges and Carians, the latter of whom [illegible] south-western corner of Asia Minor in historical times.

Again, it is probable, if not certain, that the whole Peloponnese, and possibly parts of Central Greece, were inhabited by Ionians previous to their conquest by Achaeans. The traditional home of the Ionians was in the north-eastern Peloponnese, whence they were driven to Attica and the Cyclades by an Achaean invasion. The fact that the name Ionian was applied to the sea west of Greece, on whose shores no Ionians lived in historical times, nor could have done so for many centuries previously, shows that the whole Peloponnese at least must once have been regarded as Ionian. The Achaeans emerge into history in the middle of the 14th century B.C. In the year 1922 a reference to them (Akhkhiyawa) in one of the Hittite texts of that date was read by Dr. Forrer. They were at that time an important naval power situated in the western regions of Asia Minor and the island of Lesbos, and were under the leadership of a prince named Attarsiyas. They appear to have been also in Cyprus and Pamphylia. Later, as has been already mentioned, in the Homeric age the Achaeans were lords of the Peloponnese and as far north as Thessaly, and their name, so far as can be gathered, was employed as a general designation for all Greeks.

The physical characteristics of the Achaeans are difficult to determine, and not a very safe guide. Three passages in the *Odyssey* refer to tallness of stature as a mark of beauty, and it was, perhaps, therefore rare. Heroes are sometimes referred to both by Homer and Hesiod as fair-haired (*ξανθός*) (though the epithet may mean nothing more than not having *black* hair) and we know that both in classical and Roman times blue or grey eyes were rare in Greece.

In classical times the name Achaeans was confined to the people inhabiting the strip of land along the north coast of the Peloponnese, between the Corinthian gulf and the northern Arcadian mountains. They were for the most part subject to Dorian overlords, and their dialect was Doric. After the days of the Macedonian supremacy the Achaean League became one of the most powerful influences in Greece, and it was this fact that led the Romans, when they made the country into a province, to give it the name of Achaea. **ACHAEMENES** (HAKHAMANI), the eponymous ancestor of the royal house of Persia, the Achaemenidae. According to Darius in the Behistun inscription and Herod. iii. 75, vii. 11, he was the father of Teïspes, the great-grandfather of Cyrus. Whether he really was an historical personage, or merely the mythical ancestor of the family, cannot be decided. According to Aelian (*Hist. anim.* xii. 21), he was bred by an eagle. We learn from Cyrus's proclamation that Teïspes and his successors had become kings of Anshan; *i.e.*, a part of Elam (Susiana), where they ruled as vassals of the Median kings, until Cyrus the Great in 550 B.C. founded the Persian empire. After the death of Cambyses, the younger line of the Achaemenidae came to the throne with Darius, whose father Hystaspes was, like Cyrus, the great-grandson of Teïspes. Cyrus, Darius and all the later kings of Persia call themselves Achaemenides (*Hakhāmanishiya*). With Darius III. *Codomannus* the dynasty became extinct and the Persian empire came to an end (330 B.C.). The adjective *Achaemenius* is used by the Latin poets as the equivalent of "Persian" (Horace, *Odes*, ii. 12, 21). *See* PERSIA. The name Achaemenes is borne by a son of Darius I., brother of Xerxes. After the first rebellion of Egypt, he became satrap of Egypt (484 B.C., Herod. vii. 7). He commanded the Persian fleet at Salamis, and was (460 B.C.) defeated and slain by Inarus (Herod. iii. 12), the leader of the second rebellion of Egypt (*see* also Diodorus xi. 71).

**ACHAEMENIDAE,** the Graecized name of the family of the ancient Persian kings. (*See* PERSIA: *Ancient History*.)

**ACHARD, FRANZ CARL** (1753–1821), Prussian chemist, was born at Berlin on April 28, 1753, and died at Kunern, in Silesia, on April 20, 1821. He was a pioneer in turning to practical account A. S. Marggraf's discovery of the presence of sugar in beetroot, and by the end of the 18th century he was producing considerable quantities of beet sugar, though by a very imperfect process, at Kunern, on an estate which was granted him, about 1800, by the king of Prussia. There, too, he carried on a school of instruction in sugar-manufacture. He published several volumes of chemical and physical researches and discovered, among other things, a method of working platinum.

**ACHARIUS, ERIK** (1757–1819), Swedish botanist, was a pupil of Linnaeus at Uppsala University, and devoted himself to the study of lichens. His most important works are *Lichenographia Universalis* (1810) and *Synopsis methodica Lichenum* (1814).

**ACHATES**, the companion of Aeneas in Virgil's *Aeneid*. The expression "fidus Achates" has become proverbial for a loyal and devoted companion.

**ACHELOUS** (mod. *Aspropotamo* "white river"), the largest river in Greece (130m.) It rises in Mt. Pindus, and, dividing Aetolia from Acarnania, falls into the Ionian Sea. Its water is charged with fine mud, which is deposited along its banks in fertile, marshy plains. At its mouth, a number of small islands (Echinades) have been enveloped in this deposit. It was formerly called Thoas, from its impetuosity, and its upper portion Inachus, the name Achelous being restricted to the shorter eastern branch. The name is given to several other rivers in Greece, and appears in cult and in mythology as that of the typical river-god.

**ACHENBACH, ANDREAS** (1815–1910), German landscape painter, was born at Cassel on Sept. 29, 1815, and died on March 31, 1910. He was a pioneer of the German realistic school He studied at Dusseldorf under Schirmer, but emancipated himself from the contemporary school of landscapists which delighted in the representation of romantic scenery. He was the first artist of the Düsseldorf school who painted nature for its own sake. As a young man he sought inspiration in Holland and Norway. His pictures of the stormy North sea, of Dutch canal scenes and of Rhineland villages contrasted favourably with the sentimental landscapes of his contemporaries. His works are to be found at the Berlin National Gallery, the New Pinakothek in Munich, and the galleries at Dresden, Darmstadt, Cologne, Düsseldorf, Leipzig and Hamburg.

His brother, OSWALD ACHENBACH (1827–1905), is distinguished for his colourful renderings of the Bay of Naples, of Rome and of Venice. He broke away from the traditional classicist interpretation of these scenes and revelled in strong and glowing colour effects. His works are exhibited at most of the important German galleries of modern art.

**ACHERNAR,** $\alpha$ Eridani, the brightest star in the constellation Eridanus (*q.v.*).

**ACHERON** (Gr. river of "woe"), name of several rivers of Greece. In Greek mythology the name is specially given to a river of Hades, over which departed souls were ferried by Charon. Later Greek and Roman poets used it to designate the lower world generally.

**ACHESON, EDWARD GOODRICH** (1856–1931), American inventor, was born at Washington (Pa.), on March 9, 1856. He was compelled to earn his living at an early age, but devoted his leisure to mechanical invention and experiment. Becoming interested in electricity, he entered the employ of Thomas A. Edison. In 1881 he assisted in the preparation of the Edison exhibit at the Paris International Exposition and later, for the Edison interests, installed the first electric lights in Italy, Belgium and Holland. On returning to the United States he resumed his experiments. He discovered a new abrasive substance of great cutting power, which he named carborundum. Inventing a method of producing a remarkably pure synthetic graphite, he organized in 1899 the Acheson Graphite Co., to handle the patent. This company met with great success. His numerous patents cover methods of producing metallic silicon cheaply; the lubricants known as oildag, aquadag and gredag; the treatment of clay to increase plasticity (Egyptianized clay).

**ACHIACHARUS,** the name of an eastern sage whose "sayings" spread far and wide and had a remarkable influence on the world's gnomic literature. His history and moralizing sayings have been preserved, in whole or in part and with interesting minor variations, in Syriac, Arabic, Ethiopic, Armenian and Slavonic translations, and fragments of his teaching have survived among the Jewish papyri from Elephantine (*see* below). Rumanian and old Turkish versions are also in existence.

In the story of his life he is represented as the chief adviser of the Assyrian king Sennacherib. He adopted a nephew, Nadan by name, to succeed him. Profligate and wearied by Achiacharus' unending inculcation of wisdom in proverbial form, Nadar brought about his uncle's downfall. But saved from death by his executioners, Achiacharus survived in an underground dungeon and resumed his former position at court when the king was in dire need of his services as an envoy and magician who could satisfy the demands of the king of Egypt. Thus he built a castle in the air and twisted ropes out of sand. On his return to Assyria he took vengeance on his nephew, flogged him, condemned him to his former dungeon dwelling constantly visited him to taunt him and give him instruction in which, as in Aesop's fables, animals and birds give expression to shrewd moral and ethical ideals Nadan avoided execution by swelling out suddenly and bursting asunder, thus anticipating and possibly inspiring one of the New Testament descriptions of the end of Judas.

The date of composition and the original home of this work are matters of dispute. The Elephantine Papyri provide evidence that it was in existence by the fifth century B.C. The mention of Sennacherib may well point to Mesopotamia as its original home. But the story and the sententious sayings contained in it are probably far older than the Assyrian Empire. Sennacherib's name was probably inserted in the story when it had already assumed a form similar in most other respects and had already embarked on its career of permeating the literature and thought of Palestine, Egypt and the Mediterranean coastlands.

**ACHILL,** the largest island off Eire, separated from the Curraun peninsula of the west coast by the narrow Achill sound. Pop. (1936) 4,875. It is included in Mayo. Its shape is triangular and is 15 mi. from east to west and 12 mi. from north to south. Area 57 sq.mi. The island is mountainous, the highest points being Slieve Croaghaun (2,192 ft.) in the west, and Slievemore (2,204 ft.) in the north; the extreme western point is the bold and rugged promontory of Achill head, and the northwestern and southwestern coasts consist of cliffs reaching 800 ft. in Minaun, near Keel on the south. The seaward slope of Croaghaun is abrupt and the scenery beautiful. Desolate bogs alternate with the mountains; and the inhabitants earn a scanty subsistence by fishing and tillage, or go to England and Scotland during the harvesting. The Congested Districts board made efforts to improve the condition of the people, and a branch of the Great Southern railway to Achill sound, together with a swivel bridge across the sound, improved communications. In Dugort is a Protestant colony, known as "the Settlement," founded in 1834. There are megalithic remains at Slievemore and elsewhere.

**ACHILLES,** son of Peleus (*q.v.*) and Thetis; bravest, handsomest and swiftest of the army of Agamemnon. According to Homer, he was brought up by his mother at Phthia with his cousin and his intimate friend Patroclus; his teachers were Phoenix and Cheiron. The non-Homeric tales of his childhood contain obvious folk-tale themes. Thetis had seven children, all of whom she put into the fire or a cauldron (*see* HERCULES), to make them immortal. All died save Achilles; because Peleus interfered at this point, Thetis left him. (Fairy Bride theme.) Or, Thetis dipped the child in the waters of the river Styx, by which (like Sigurd Fafnirs-bane) he became invulnerable, except that part of his heel by which she held him; whence the proverbial "heel of Achilles."

During the first nine years of the war as described in the *Iliad*, Achilles ravaged the country round Troy, and took 12 cities. In the tenth year occurred the quarrel with Agamemnon. In order to appease the wrath of Apollo, who had visited the camp with a pestilence, Agamemnon had restored Chryseis, his prize of war, to her father, a priest of the god, but as a compensation deprived Achilles, who had openly demanded this restoration, of his favourite slave Briseis.

Achilles refused further service, and rejected offers of compensation for the insult. During his absence the Greeks were hard pressed, and at last he allowed Patroclus to personate him, lending him his chariot and armour. When Hector slew Patroclus Achilles

was reconciled to Agamemnon, got new armour from Hephaestus. slew Hector, and, after dragging the body about at the wheels of his chariot, restored it to Priam at his earnest entreaty.

The *Iliad* concludes with the funeral rites of Hector. It makes no mention of the death of Achilles, but hints at its taking place "before the Scaean gates." The *Odyssey* mentions his funeral. The *Aethiopsis* took up the story of the *Iliad*. It told how Achilles, having slain the Amazon Penthesileia and Memnon (*q.v.*), was himself slain by Paris, whose arrow was guided by Apollo to his vulnerable heel. He was worshipped in many places: at Leuke, where he was honoured with offerings and games; in Sparta, Elis, and especially Sigeum on the Hellespont, where his famous tumulus was erected.

Behind these legends there probably lies a real man, certainly not a sun-, river- or other god. No certain statue of him, but numerous other representations in art, survive.

**ACHILLES, TENDON OF:** *see* TENDON OF ACHILLES.

**ACHILLES TATIUS,** of Alexandria, Greek rhetorician, author of the erotic romance, the *Adventures of Leucippe and Cleitophon,* flourished about A.D. 450, perhaps later. Suidas, who alone calls him Statius, says that he became a Christian and eventually a bishop (like Heliodorus, whom he imitated) but there is no evidence of this. Photius, while severely criticizing his lapses into indecency, highly praises the conciseness and clearness of his style, which, however, is artificial and laboured.

The large number of existing mss. attests the popularity of the romance. (*Editio princeps,* 1601; first important critical edition by Jacobs, 1821; later editions by Hirschig, 1856; Hercher, 1858. There are translations in many languages; in English by Anthony H[odges], 1638, and R. Smith, 1855.)

Suidas also ascribes to this author an *Etymology,* a *Miscellaneous History of Famous Men,* and a treatise *On the Sphere.* Part of the last is extant under the title of *An Introduction to the Phaenomena of Aratus.* But if the writer is the *prudentissimus Achilles,* referred to by Firmicus Maternus (about 336) in his *Matheseos libri,* iv, 10, 17 (ed. Kroll), he must have lived long before the author of *Leucippe.* The fragment was first published in 1567, then in the *Uranologion* of Petavius, with a Latin translation, 1630.

**ACHILLINI, ALESSANDRO** (1463–1512), Italian philosopher and anatomist, was born at Bologna, Oct. 29, 1463. A much admired lecturer at Bologna and Padua, he was called the "second Aristotle." He made some important studies of human anatomy and was one of the first anatomists to dissect a human cadaver. His philosophical works were printed in one volume in Venice in 1508, and reprinted with additions in 1545, 1551 and 1568. Among his anatomical writings were *Corporis humani anatomia* and *Anatomicae annotationes.* He died at Bologna on Aug. 2, 1512.

His brother, GIAN FILOTEO ACHILLINI (1466–1538), was the founder of the Academy of Viridario at Bologna in 1511, and the author of *Il Viridario* and other writings, verse and prose. His grand-nephew, CLAUDIO ACHILLINI (1574–1640) was a lawyer who achieved some fame as a versifier of the school of the Secentesti, a group of Italian writers characterized by affectation and extravagance of style.

BIBLIOGRAPHY.—His works were printed at Venice (1508, 1545, 1551 and 1568).

**ACHIMENES,** a genus of plants (family Gesneriaceae, to which belong also Gloxinia and Streptocarpus), natives of tropical America, and well known in cultivation as stove or warm greenhouse plants They are herbaceous perennials, generally with hairy serrated leaves and handsome flowers. The corolla is tubular with a spreading limb, and varies widely in colour, being white, yellow, orange, crimson, scarlet, blue or purple.

**ACHIN** (Dutch, Atjeh), and dependencies, is a Dutch government in Sumatra, Netherlands Indies. It forms the northern extremity of the island, the boundary extending from Salahadji, a point on the east coast, just north of Aru bay, to a point on the west coast, about midway between Singkel and Barus, has an area of 21,448 sq mi. and is divided into four districts It is very mountainous, with long ranges, running parallel with the axis of the island, and, particularly, in the east and extreme northwest, spurs projecting towards the coast. Most of the interior is mountainous, but, except in the extreme north, there is a fairly wide coastal plain, narrower in the east than in the west The highest peaks are Bandahara (9,876 ft) on the southern central boundary, Abongabong (9,794 ft.) in the central part and Leuser (11,092 ft.) in the south. In the north the coast is varied, the cliffs, crowned with dense vegetation, rising precipitously from the sea in places, while in other parts there are beaches or cultivated and populated plains Elsewhere the coast is flat, and, in places, marshy. The rivers are short, run down sharply to the coast, and have little value for shipping, except small native boats. The ports of Achin are Oleh-leh and Sigli on the north and Lhokseumawe and Idi on the east coast, but large vessels go to the free port of Sabang on the island Pulu Weh, 50 mi. north of Oleh-leh. Oleh-leh is the gateway to Kota Raja, the capital of Achin. Kota Raja is situated on the Achin river, some three miles up from the sea The capital of Achin, when this was the wealthiest and most powerful sultanate in northern Sumatra, having suzerainty over territory in the Malay Peninsula, Kota Raja still possesses remains of its former glory, but it consists largely of wooden and attap-roofed houses, built in *kampongs,* with the old Achinese citadel (now garrison-quarters), a large mosque, the modern residences of the governor and civil staff, offices of the administration, European business premises, together with two small hotels. Three bridges span the river. Kota Raja has a cable station, is connected by telegraph with Medan, and then across the island with Padang and the south generally. A steam tramway links it up with Oleh-leh and, across country, with Sigli, on the northeast coast, whence it proceeds to Kuala Simpang (Aru bay), where it joins up with the lines in Deli (east coast of Sumatra province). An agricultural adviser, representing the department of agriculture, trade and industry, is stationed at Kota Raja, and the town has a population of 10,724, composed of 1,137 Europeans and Eurasians, 6,146 natives, and 3,441 foreign Asiatics. The principal industries of Achin are silk weaving, gold working, wood carving and shipbuilding, and there is a fishing and coasting trade. Rice is the food staple, grown more under *sawah* culture than *ladang,* and there are irrigation works for rice culture. Pepper, copra and areca nuts and rubber are the chief exports, but sugar cane and fruit trees are grown, cattle-breeding is carried on. There are over 100,000 ac. under rubber (Hevea). Imports (1939) 2,502,000 and exports 7,442,000 guilders. Pop. (1930) 1,003,062, composed of—Europeans and Eurasians 3,244, natives 975,945, and foreign Asiatics, including Chinese, 23,873. The Achinese are Malayan, but smaller and thinner than the Malays, with darker skin and larger eyes. The people of the highlands (*orang tunŏng*) are prouder and more courageous and independent than those of the lowlands (*orang barŏh*), but both are fond of warfare. The nobility usually claim Arab descent, and there are evidences of old-time contact with Hindus. Both men and women wear the characteristic wide Achinese trousers; the women are skilful weavers; the men fairly good craftsmen and skilled agriculturists. Rice, fish and vegetables, eaten twice daily, form the usual fare, betel-nut is used universally, and opium-smoking is indulged in, but strong drink is used only among the upper classes. Houses are built on piles, divided into several rooms, generally with front and back veranda, reached by steps. They stand in a fenced courtyard, with fruit trees about them—the domestic animals and birds live underneath—and are usually untidy in appearance. In a *meneusah,* without the village, the young unmarried men and strangers sleep, and it is also used for meetings and religious observances. Society is divided into families; there are traces of an old matriarchal form, but the patriarchal system is now general. Marriage is celebrated at an early age, divorce is rare, and polygamy is not common, except among the highest classes. The position of the Achinese woman is high. Achin is under direct Dutch government, but many Achinese chiefs exercise authority as government officials. The Achinese are Mohammedans.

The people are fond of competitions in recitations of poetry and of musical performances on native instruments; also of feasts and gambling, while animals are kept for fighting purposes.

### HISTORY

Northern Sumatra was visited by a number of European travellers in the middle ages; for example, Marco Polo, Friar Odoric and Nicolo de' Conti (*qq v.*). But the first voyager to visit Achin, known then by that name, was Alvaro Tellez, a captain of Tristão da Cunha's fleet, in 1506. It was then a mere dependency of the adjoining state of Pedir. By 1526 Achin had assimilated all the other states of northern Sumatra, but its power was at its height in the time of Sultan Iskandar Muda (1607–36). At that period the territory extended from Aru opposite Malacca round the north to Benkulen on the west, 1,100 mi. of seaboard; the island of Nias with the continental states of Johor, Pahang, Kedah and Perak were subject states.

The traders of the 17th century went to Achin for gold. The first Dutch (1599) and first English (1602) commercial ventures to the Indies were to Achin. Letters were sent from Queen Elizabeth and King James I to the princes of Achin. But jealousy and suspicion interfered with trade and the English factory, erected several times, was not long maintained. The French attempted unsuccessfully in 1621 to establish relations as, in spite of all difficulties, the trade was important. William Dampier (*c.* 1688) speaks of the number of foreign merchants settled there

The Portuguese were constantly warring with the kings of Achin until the former lost Malacca (1641). Iskandar Muda sent 60,000 men against Malacca in 1615, but the Portuguese held out. From 1641 four queens successively reigned over Achin, but in 1699 the Arab or fanatical party suppressed female government and put a chief of Arab blood on the throne. From that time Achin's power decayed rapidly.

After the restoration of Java to the Netherlands in 1816 a good deal of weight was attached by the neighbouring British colonies to the maintenance of influence in Achin, and in 1819 a treaty of friendship was concluded by Achin with the Calcutta government which excluded other European nationalities from fixed residence in Achin. When the British government, in 1824, made a treaty with the Netherlands, surrendering the remaining British settlements in Sumatra in exchange for certain possessions on the continent of Asia, no reference was made in the articles to the Indian treaty of 1819; but an understanding was exchanged that it should be modified while no proceedings hostile to Achin should be attempted by the Dutch.

This reservation was formally abandoned by the British government in a convention signed at The Hague on Nov. 2, 1871; and in March 1873 the government of Batavia declared war upon Achin. Doubtless there was provocation, for the sultan of Achin had not kept to the understanding that he was to guarantee immunity from piracy to foreign traders; but the necessity for war was greatly doubted, even in the Netherlands. A Dutch force landed at Achin in April 1873 and attacked the palace but was defeated. Another attempt ended in the fall of Achin in Jan. 1874. General van der Heyden seemed to have quelled them (1878–81), but in 1896 they revolted again and not till 1898 and the succeeding year did General van Heutsz restore order. In 1901 the pretender sultan fled to the Gajoes, a neighbouring tribe inland and for three years heavy fighting went on. Later the coastal regions were subdued, but in the interior there was recurrent trouble. Japan occupied the area in March 1942, during World War II.

Kruijt, *Atjeh en de Atjehers* (Leyden, 1877); Kielstra, *Beschrijving van den Atjeh-oorlog* (The Hague, 1885); Renaud, *Jaarboek van het Mynwezen* (1882); J. Jacobs, *Het famille-en Kampongleven op Groot Atjeh* (Leyden, 1894); C. Snouck Hurgronje, *De Atjehers* (Batavia, 1894, trans. 1906); W. Volz, *Nord-Sumatra; Die Gajoländer* (Berlin, 1912). *See* also *Tijdschrift voor Taal en Volkenkunde Nederlandsche Indie.*

**ACHINESE,** a Sumatran tribe of Proto-Malayan stock modified by Hindu and Arab elements, the darker complexion of the lowlanders as distinct from the highlanders of the tribe being attributed to a greater infusion of south Indian blood. They are Muslims but not strict and early in the 13th century became important in the East Indies, having commercial and political relations with Egypt, Europe and Japan Noted for valour and love of freedom, they long maintained their independence against the Dutch. They are excellent craftsmen; women go unveiled and there is little polygamy. Their language, though Malayan, contains many Sanskrit words, and there are other remnants of their former Hindu or Buddhist culture.

*See* E. Marsden, *History of Sumatra* (1783); C. Snouck Hurgronje, *The Achehnese* (1906).

**ACHINSK.** (1) A province in the Siberian area of the R.S F.S.R. Area 25,169 sq.mi. Population 392,900; urban 24,997; rural 367,003. It consists of pine, spruce and birch forest, with open grassy areas on which rye and wheat are grown by the peasants and immigrant colonists. The winter is severe and occasionally early frosts ruin the crops. Gold is found to the west of the town of Achinsk. (2) A market centre, lat. 56° 30′ N., long 90° 35′ E., on the Chulym river, which links it with the Ob river It is on the Trans-Siberian railway and has a branch to the rich Minusinsk district.

**ACHOLI,** a Negro people of the upper Nile valley, akin to the Shilluks of the White Nile. They frequently decorate the temples or cheeks with wavy or zigzag scars and also the thighs with scrolls; some pierce the ears. Their huts are circular with a high peak, a mud sleeping platform, jars of grain and a sunk fireplace; they are decorated with geometrical or conventional designs in red, white or gray. The Acholi are good hunters, using nets and spears, and keep goats, sheep and cattle. In war they use spears and long, narrow shields of giraffe or ox hide. Their language is Nilotic. Their religion is a vague fetishism.

**ACHROMATIC LENS,** a combination of two or more lenses corrected for chromatic aberration. (*See* OPTICS; LENS; PHOTOGRAPHY: *Photographic Lenses.*)

**ACHURCH, JANET** (MRS. C. CHARRINGTON) (1864–1916), English actress, was born in Manchester. She first appeared at the Olympic theatre, London, Jan. 8, 1883, with Geneviève Ward in the farce of *Betsy Baker.* Two years later she joined Frank Benson's company and played Shakespearean heroines; but her chief success was gained as Nora Helmer in Henrik Ibsen's *A Doll's House,* when that play was first produced in England in 1889. She appeared later in other Ibsen plays and in those of Bernard Shaw.

**ACIDALIUS, VALENS** (1567–1595), German scholar and critic, was born at Wittstock on May 25, 1567, and died at Neisse on May 25, 1595, at the age of 28. Acidalius wrote notes on Velleius Paterculus (1590), Curtius (1594), the panegyrists. Tacitus and Plautus, published after his death.

*See* Leuschner, *Commentatio de A. V. Vita, Moribus, et Scriptis* (1757).

**ACIDIMETRY,** the determination of the quantity of available acid in a sample of material. (*See* CHEMISTRY: *Analytical Chemistry.*)

**ACIDS AND BASES.** Acid is the name loosely applied to any substance which, in water solution, tastes sour, changes the colour of indicators (*e g.,* reddens blue litmus), reacts with some metals (*e.g.,* iron) to liberate hydrogen and "neutralizes" bases. Base is the name loosely applied to any substance which, in water solution, is slippery to the touch, tastes bitter, reverses the colour changes produced by acids on indicators (*e.g.,* turns red litmus blue) and neutralizes acids. Neutralization is the process whereby an acid and a base enter into a chemical reaction which destroys the characteristic properties of both and produces a compound known as a salt.

There are several different scientific definitions of acids and bases in current use; these will be explained below.

Among the industrially important acids are sulphuric, nitric, hydrochloric, phosphoric and acetic; among the industrially important bases are sodium and potassium hydroxides, sodium and potassium carbonates, calcium oxide (lime) and ammonia. Sulphuric acid (*q.v.*) is manufactured in the United States for about

$17 a ton at the rate of more than 8,000,000 tons per year. It is thus one of the most important of chemical products; the tonnage produced annually greatly exceeds that of any metal except iron. Sulphuric acid is used in the refining of petroleum, in storage batteries, in "pickling" steel, in the manufacture of fertilizer, etc. Nitric acid (*q.v.*) and acetic acid (*q v.*) are widely used in chemical industry. Among the uses for the former are the manufacture of explosives and of dyestuff intermediates; among the uses for the latter are the manufacture of plastics and of solvents. Sodium and potassium hydroxide (*see* ALKALI) are used in soap manufacture; sodium carbonate is one of the important ingredients for the manufacture of glass and is used in the household as washing soda. Ammonia (*q v.*) is widely used, in the form of ammonium sulphate, as a fertilizer; it is also the raw material for the production of much nitric acid. The references already cited give the details regarding the manufacture and use of these compounds; here only the theory of acids and bases is considered.

**History.**—Almost the only acid substance known to the Egyptians, Greeks and Romans was vinegar which was produced by the action of air on wine (fermentation). Vinegar is a dilute and impure solution of acetic acid in water; the word "acid" is derived from the Greek ὀξύς, sour, and ὄξος, vinegar. Impure acetic acid (vinegar) was utilized industrially by the ancients. Theophrastus of Eresus, in the 4th century B.C., gave directions quite similar to comparatively modern ones for the preparation of white lead pigment from vinegar and metallic lead. Sodium carbonate (obtained by the evaporation of alkaline water from arid regions) and potassium carbonate (from wood ashes) were known in ancient times; lime was obtained, as it is today, by roasting calcium carbonate. The manufacture of sodium and potassium hydroxides by the action of lime on sodium and potassium carbonates was also practised. The exact dates at which these substances were first prepared are unknown, but the manufacture of glass (which requires sodium carbonate) was practised in Egypt at least as early as 1400 B.C.

During the middle ages, the alchemists slowly increased the knowledge of acids and bases. The preparation of nitric acid (*aqua fortis*) by the destructive distillation of a mixture of alum, iron sulphate and potassium nitrate was described by Geber around 1300, and the preparation of sulphuric acid by the destructive distillation of iron sulphate was known before 1600. (*See* ALCHEMY.) Still later, an explanation was sought for the behaviour of acids and bases. One of the early theories was that of Bertrand (1683), who suggested that ". . . an acid is a liquid body composed of small, firm and pointed particles, slightly resembling fine and delicate needles." He supposed that alkalis consist of "particles which have between their junctions pores of different structures" and that neutralization results when the needles of the acid enter the pores of the alkali. According to the phlogiston theory current in the early 18th century, the acids, such as sulphurous, phosphoric, etc., which are produced by combustion, were regarded as elementary substances. This misapprehension was abandoned along with the phlogiston theory, and temporarily replaced by Antoine Laurent Lavoisier's doctrine (1778) that oxygen is the acid-producing element. About 1808–10, the researches of Sir Humphry Davy and of J. L. Gay-Lussac and L. J. Thénard on hydrochloric acid established beyond doubt that hydrogen and not oxygen is the element essential (although not sufficient) for acidic properties. The hydrogen theory of acids was extended by S. A. Arrhenius, who showed (1887) that, in aqueous solution, acids are partly ionized (*i.e.*, they are partly separated into charged particles called ions). He further suggested that an acid should be defined as a substance which ionizes in water to yield hydrogen ions; a base should be defined as a substance which ionizes in water to yield hydroxide ions. The definitions of acids and bases given above will hereafter be called the "classical" ones. For example, nitric acid was assumed to ionize according to equation (1a); sodium hydroxide according to equation (1b):

$$HNO_3 \rightleftarrows H^+ + NO_3^-. \qquad (1a)$$

$$NaOH \rightleftarrows Na^+ + OH^-. \qquad (1b)$$

The characteristic properties of acids and bases were ascribed respectively to the hydrogen ion, $H^+$, and the hydroxide ion, $OH^-$. A substance containing hydrogen which does not ionize in aqueous solution to produce hydrogen ions (*e.g*, methane, $CH_4$) is then not an acid. In qualitative terms, a strong acid, when dissolved in water, largely or completely ionizes and thus produces a high concentration of hydrogen ions, whereas a weak acid when dissolved in water is only slightly ionized, and thus produces only a low concentration of hydrogen ions. Modern concepts of both acids and bases have been developed from Arrhenius' theory.

**The "Hydrogen-Ion" Theory of Acids.**—An enormous amount of evidence supporting Arrhenius' theory of acids and bases has been accumulated since the 1880s. (*See* SOLUTIONS. *Solutions of Electrolytes.*) It is a pertinent fact, for example, that a solution of hydrochloric acid in water conducts electricity and that, when the current passes, hydrogen gas is liberated at the negative electrode (*i.e.*, the cathode). In dilute solutions of the acid, oxygen is liberated at the positive electrode (*i.e*, the anode). These facts (and many others) can be explained by assuming that hydrochloric acid in aqueous solution is an assembly of chloride ions, $Cl^-$, and of hydrogen ions. The hydrogen ion, $H^+$, exists in water only as the hydrate, $H_3O^+$($H^+$ plus $H_2O$), called the hydronium ion; the evidence for this statement will be presented later.

Many of the reactions of aqueous solutions of acids and bases can be explained on the basis of the ionic theory. For example, the existence of charged particles in the solution accounts for the fact that the solution conducts electricity. The existence of $H_3O^+$ ions (hydrated hydrogen ions) is consistent with the fact that hydrogen gas is liberated at the cathode, for these positively charged hydronium ions are repelled by the positive electrode and attracted to the negative one, where they are discharged; hydrogen and water are thus liberated.[1] Similarly, a solution of sodium hydroxide in water is assumed to consist of an assembly of sodium ions, $Na^+$, and hydroxide ions, $OH^-$. During electrolysis, the negatively charged hydroxide ions migrate toward the anode and are there discharged to form oxygen and water. The interpretation here advanced is made much more plausible by quantitative experiments on the changes in composition which, during electrolysis, take place in those portions of the solution near the electrodes (transference experiments; *see* ELECTROCHEMISTRY).

The ionic theory helps to account for differences in the strengths of acids and bases. Any acid, HA, when introduced into water, rapidly comes to chemical equilibrium with its ions (see *Quantitative Studies of Acids and Bases*, below; also THERMODYNAMICS):

$$HA + H_2O \rightleftarrows H_3O^+ + A^-. \qquad (2)$$

Bases ionize similarly to give hydroxide ions. Such an ionization reaction may be essentially complete, as it is in an aqueous solution of the strong base sodium hydroxide, which is largely ionized even in the solid state; or it may be far from complete, as it is in an 0.1 molar aqueous solution of acetic acid, where less than 1.5% of the acid is dissociated into ions, and the rest remains as un-ionized molecules.

The ionic theory is also useful in explaining the process of neutralization. When an acid and a base neutralize one another, the hydronium (hydrated hydrogen ion) and hydroxide ions combine to form water; if equivalent quantities of the two materials are present, the reaction proceeds essentially to completion because water is only slightly dissociated into ions. The chemical equation for the reaction between potassium hydroxide and hydrochloric acid is written

$$K^+ + OH^- + H_3O^+ + Cl^- \rightleftarrows K^+ + Cl^- + 2H_2O, \qquad (3)$$

which may be simplified to

$$OH^- + H_3O^+ \rightleftarrows 2H_2O, \qquad (3a)$$

[1]Although all acids when electrolyzed liberate hydrogen at the cathode, it is not true that all compounds which liberate hydrogen at the cathode are acids. During the electrolysis of the aqueous solutions of some salts, the weak acid water, rather than the salt itself, is decomposed. Such salts, however, have no acidic properties, for example, they do not redden blue litmus.

where the potassium and chloride ions, which do not really enter into the chemical reaction, are omitted. However, these ions are present after the neutralization; with the water produced by the neutralization and the excess water present as a solvent, the ions form a solution of potassium chloride (a salt).

Many acids ionize in water to give more than one hydronium ion; these are called polybasic acids because each molecule of acid can neutralize more than one molecule of base. For example, sulphuric acid is dibasic; it ionizes in two steps.

$$H_2SO_4+H_2O \rightleftarrows H_3O^+ + HSO_4^-, \qquad (4)$$
$$HSO_4^- + H_2O \rightleftarrows H_3O^+ + SO_4^{--},$$

and forms two series of salts, corresponding to $NaHSO_4$ and $Na_2SO_4$; phosphoric acid ($H_3PO_4$) is tribasic and forms three series of salts. Bases (*e.g.*, $Ba[OH]_2$) which can ionize to give more than one hydroxide ion per molecule are called polyacid bases. The characteristic reactions of acids other than neutralization and salt formation (*e g*, the colour changes of indicators, the formation of hydrogen with metals and of carbon dioxide with carbonates) can also be explained in terms of the ionic theory. Furthermore, this theory has led to an understanding of the mechanism by which acids catalyze some reactions. For example, the role of strong acids in the bromination of acetone is explained in terms of ionization equilibria. (*See* REACTION KINETICS) The explanations for the characteristic reactions of bases parallel those for the reactions of acids.

Some acids are inorganic compounds and some are organic compounds Among the former are sulphuric, nitric, hydrochloric, perchloric, hydrofluoric, hydrobromic, phosphoric, sulphurous, hypochlorous and arsenic acids. The organic acids are further subdivided according to the structural feature in the molecule which is responsible for the acid properties. For example, there are carboxylic acids (acetic, butyric, benzoic, phthalic, stearic, oleic, etc.), sulphonic acids (benzene sulphonic acid, naphthalene disulphonic acid, etc.), phenols (phenol, or carbolic acid, cresol, etc ), enols (ascorbic acid or vitamin C, etc ) and other types too numerous to mention. Bases include the hydroxides of sodium, potassium, calcium, barium, copper, iron and other metals, as well as the hydroxides related to ammonia and to numerous organic compounds most of which are amines (compounds closely related to ammonia) such as methylamine, aniline and pyridine. There are a few compounds such as aluminum and zinc hydroxides and water, which have both slight acidic and slight basic properties; these substances are called amphoteric.

**The Hydronium Ion.**—The hydrogen ion in aqueous solution was for a long time written simply as $H^+$. This notation implied that the proton (the nucleus of a hydrogen atom [*see* ATOM]) could exist free in solution. The proton has no electrons around its nucleus and is therefore a small particle. Hence, the electrostatic field in its neighbourhood should be great. On these theoretical grounds, the existence of protons in aqueous solution appears doubtful. All the ions known to exist under such conditions have two or more electrons around their nuclei. A number of experiments have lent support to the notion that the hydrogen ion exists in aqueous solution only as the hydronium ion, $H_3O^+$. Among these can be cited the fact that liquid hydrogen chloride is a nonconductor of electricity. This compound, however, when dissolved in water, conducts current well. These phenomena are just what would be expected if pure hydrogen chloride did not ionize (*i.e.*, if $H^+$ alone could not exist under the conditions cited). When gaseous hydrogen chloride dissolves in water, the following strongly exothermic reaction presumably takes place.

$$HCl+H_2O \rightleftarrows H_3O^+ + Cl^-. \qquad (5)$$

X-ray analysis shows definitely that the hydronium ion does exist at least under certain circumstances. For example, the lattice of crystalline perchloric acid monohydrate consists of hydronium and perchlorate ($ClO_4^-$) ions. It is true that ions other than the hydrogen ion interact with water; moreover, hydronium ion in aqueous solution tends to combine with water to form hydrates of an indefinite type. But whereas, in crystalline and molten salts, ions other than the hydrogen ion can exist, there is no evidence for the existence of uncombined protons in either solid or liquid phases. (Free protons can exist under special circumstances in the gas phases; *e.g*, in a cyclotron.) In view of these facts, the hydronium ion, $H_3O^+$, will here be written for the hydrogen ion in aqueous solution.

**Bronsted-Lowry Definition.**—A broader definition of acids and bases was introduced by J. N. Bronsted and T. M. Lowry simultaneously and independently in 1923 According to this definition, any compound which can transfer a proton to any other compound is an acid; the compound which accepts the proton is a base. Two considerable advantages of the Bronsted-Lowry definition are that it can be applied to nonaqueous solutions and that it codifies and simplifies acid-base reactions. It is not inconsistent with the classical definition of acids in terms of hydrogen ions, but is rather an extension of the older concept. According to the Bronsted-Lowry scheme, all acid-base equilibria are then represented by the equation:

$$\text{Acid}_1+\text{base}_2 \rightleftarrows \text{base}_1+\text{acid}_2$$
$$\text{or } HA+B \rightleftarrows A^- + BH^+. \qquad (6)$$

Here $A^-$ and B are described as the conjugate bases of the acids HA and $BH^+$, respectively; similarly, HA and $BH^+$ are the conjugate acids of the bases $A^-$ and B. In such generalized equations the presence or absence of an electric charge on any particle does not necessarily indicate the net charge on the particle in question. It merely shows that an acid has one more positive or one less negative charge than its conjugate base, and conversely that a base has one less positive charge or one more negative charge than its conjugate acid. Examples of acid-base equilibria are shown in equations (7a) and (7b):

$$H_3O^+ + NH_3 \rightleftarrows H_2O + NH_4^+, \qquad (7a)$$
$$H_2O + CH_3CO_2^- \rightleftarrows OH^- + CH_3CO_2H. \qquad (7b)$$

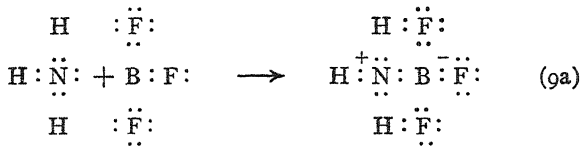
In these equations, ammonium ion is the acid conjugate to the base ammonia, acetic acid is the acid conjugate to the base acetate ion, hydronium ion is the acid conjugate to the base water, and water is the acid conjugate to the base hydroxide ion. (Water is thus seen to be amphoteric.) According to the Bronsted-Lowry scheme, the existence of acids implies the existence of bases (and vice versa), just as the existence of oxidizing agents implies the existence of reducing agents (and vice versa).

It has long been known that an aqueous solution of pure sodium acetate gives a basic reaction toward litmus. This fact may be explained by equation (7b), which shows that the reaction between water and acetate ion produces some hydroxide ions, which are responsible for the colour changes of the indicator. In classical language, reaction (7b) is described as the hydrolysis of the acetate ion; in Bronsted-Lowry's terminology, it is called the ionization of the base, acetate ion.

The hydrolysis (equation [7a]) of ammonium chloride (classical) is similarly replaced by the ionization of the acid, ammonium ion (Bronsted-Lowry). A solution of aniline hydrochloride has about the same acidity as one of acetic acid; it is, therefore, both convenient and informative to state that the anilinium ion, $C_6H_5NH_3^+$, is an acid of about the same strength as acetic acid.

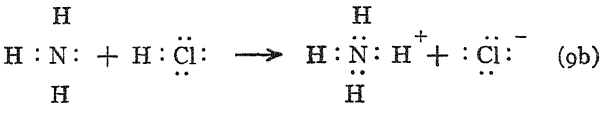
The Bronsted-Lowry definition considerably enlarges the number of compounds considered (on the basis of the classical definition) as acids and bases. The class of bases is expanded to include not only the hydroxide ion and amines but also the acetate ion, phosphate ion, carbonate ion, sulphide ion, etc., since each of these negative ions can acquire a proton from an appropriate acid. Similarly, the class of acids is expanded to include the ammonium ion, anilinium ion, the oxonium ion of alcohol, etc., since each of these positive ions can transfer a proton to an appropriate base. Furthermore, the hydrogen (or hydronium) and hydroxide ions are no longer considered the exclusive bearers of acidic and basic properties; an example in which un-ionized molecules function as acids is afforded by the phenomenon of general acid catalysis.

One of the characteristic properties of acids and of bases is that they increase the rate of (*i.e.*, they catalyze) certain chemi-



cal reactions. There are a number of reactions, such as the hydrolysis (inversion) of cane sugar, which are catalyzed exclusively by hydronium ions; similarly, there are reactions catalyzed exclusively by hydroxide ions. But there are reactions (*e g*, the decomposition of nitramide) which are catalyzed by all bases, reactions (*e.g.*, the hydrolysis of ethyl orthoacetate) which are catalyzed by all acids and reactions (*e g*, the bromination of acetone) which are catalyzed by all acids and all bases, the terms acid and base being used here in the Bronsted-Lowry sense

The rate constant (*see* REACTION KINETICS) for a reaction of the third type can be represented as a sum



$$k = k_O + \sum_A k_A c_A + \sum_B k_B c_B, \qquad (8)$$

where $k_A$ is the rate constant associated with each acid present at a concentration $c_A$, $k_B$ is the rate constant associated with each base present at a concentration $c_B$, $k_o$ is the rate constant for catalysis by water and the symbol $\sum$ indicates a summation over all acids (or bases) present in the solution. In those general acid or general base reactions, the mechanism of which is understood, the rate-controlling step is actually the acid-base reaction; *e.g.*, the reaction whereby a base removes a proton from a weak acid. Here the usefulness of the Bronsted-Lowry definition is obvious

**Lewis Definition.**—G. N. Lewis has suggested (1923) a definition for the word acid which extends this class of compounds even beyond the limits set by Bronsted and Lowry. According to the electronic concept of valence (*see* CHEMISTRY), a proton from an acid, during neutralization, becomes attached to an unshared pair of electrons in the molecule of a base. Lewis used the word acid to include all substances which, during a chemical reaction, become attached to an unshared pair of electrons in some other molecule. This definition includes, besides the conventional acids, such substances as aluminum chloride, boron trifluoride and zinc chloride. For example, boron trifluoride (*see* equation [9a]) reacts with ammonia much as does hydrogen chloride (equation [9b]). The electronic structures of the reactants and reaction products are shown in equations (9a) and (9b):

(9a)

(9b)

Furthermore, in certain nonaqueous solvents, boron trifluoride and aluminum chloride react with indicators to produce the same colour changes produced by conventional acids; these same reagents catalyze many reactions (*e g.*, the Friedel-Crafts reaction) which are known to be acid catalyzed. It should be noted that the Lewis definition of acid departs from both the classical and Bronsted-Lowry use of the word, in that hydrogen is no longer considered essential to acidity.

The analogy which Lewis has pointed out between conventional acids, such as sulphuric, and materials, such as boron fluoride, is an important one. Whether these materials should be called acids is a matter of nomenclature depending on personal preference and usage. Most chemists in 1946, however, referred specifically to the substances in question as "Lewis acids" or as "electrophilic reagents" or as "cationoid reagents."

**Quantitative Studies of Acids and Bases.**—It has previously been pointed out that those acids which in aqueous solution are largely dissociated into ions are called strong acids; those which under similar conditions are only slightly dissociated are called weak acids. There have been many quantitative investigations of the strengths of acids in various solvents; here only aqueous solutions will be discussed.

In water, any acid HA is ionized according to equation (2),

$$HA + H_2O \rightleftharpoons H_3O^+ + A^-. \qquad (2)$$

The equilibrium constant for the reaction is represented by equation (10)

$$\frac{[H_3O^+][A^-]}{[HA]} = K_A, \qquad (10)$$

where the expressions in brackets represent the activities of the acid and its ions. (The activity of each ion or molecule is approximated in dilute solution by its concentration, *see* THERMODYNAMICS.) The activity of water is omitted from equation (10) because it is for all practical purposes constant and can therefore be included in the equilibrium constant $K_A$ A strong acid then is one with a large value for its ionization constant $K_A$; indeed, the value of this constant is a quantitative measure of the strength of the acid in question In accordance with the equation (10), the more dilute the solution, the more extensively is the acid ionized. If it is possible by some analytical technique to determine the concentration of hydronium ions in solution, where the gross concentration of ionized and un-ionized acid is known, $K_A$ may be computed. No purely chemical method of analysis for $H_3O^+$ can succeed because, when hydronium ions are removed by any reaction whatsoever, the equilibrium (2) is rapidly re-established and more acid is ionized. Chemical methods, therefore, determine only the gross amount of acid present, not the amount ionized at any given moment; these methods are then useful for quantitative analysis of solutions of acids and bases. There are, however, many physical methods for determining the momentary concentration (or activity) of the hydronium ions. (*See* HYDROGEN IONS.) They include colorimetric, conductimetric, electrometric, catalytic and other methods Here only the colorimetric method will be outlined, as an example of the type of procedure which can be employed.

If the ion $A^-$, or the acid HA, is coloured, or if both are coloured and the colours differ, then the ionization constant can be determined colorimetrically. The colour intensity per mole of the ion $A^-$ is determined from a solution of its sodium or potassium salt; the colour intensity per mole of the acid HA is determined from an aqueous solution of a mixture of the acid in question and some strong acid (such as hydrochloric) which represses the ionization of the weaker acid. The concentrations of the ion $A^-$ and of the acid HA are then determined colorimetrically, or spectrophotometrically, for any solution in which both are present. From considerations of electrical neutrality, the concentration of hydronium ion can then be computed. The method described can be extended to include ultra-violet and Raman as well as visible spectra.

The ion product of water, $K_W$, has been accurately determined (*see* equation [3a]) and from this constant and the ionization constant of any acid, the ionization constant of the conjugate base may be computed as follows:

$$[H_3O^+]\ [OH^-] = K_W = 1 \times 10^{-14} \text{ at } 25^\circ \text{ C.},$$
$$\frac{[H_3O^+]\ [A^-]}{[HA]} = K_A, \qquad (11)$$
$$\frac{[HA]\ [OH^-]}{[A^-]} = K_W/K_A = K_B.$$

Here as before the symbols HA and $A^-$ do not necessarily represent uncharged and charged particles, respectively; they are intended only to show that any acid has one more positive charge (or one less negative charge) than its conjugate base. For example, it is convenient sometimes to speak of the acid strength of the ammonium ion and sometimes of the base strength of ammonia; the two ionization constants are related by equations (11).

It is to be noted that, with an amphoteric substance, HA, the equations (11) relate the acid ionization constant of HA with the basic ionization constant of the conjugate base $A^-$, and also relate the basic ionization constant of HA with the acid ionization constant of the conjugate acid $H_2A^+$. There is on the other hand no general quantitative relationship between the acid and basic ionization constants of the amphoteric substance HA, itself.

In aqueous solution, sulphuric acid, nitric acid and hydrochloric acid are all strong acids; that is to say, they are all largely ionized. The ionization constant of hydrochloric acid and the first ionization constant of sulphuric acid are in fact so large that they have not yet been properly measured in water; the ionization constant of nitric acid, although large, is measurable Most organic acids, on the other hand, are weak acids, and some of them are very weak. Table I contains the ionization constants of some representative acids.

TABLE I.—*The Ionization Constants of Selected Acids in Water (25° C)*

| Acid | $K_A$ |
|---|---|
| Perchloric acid ($HClO_4$) | Too great to measure |
| Benzene sulphonic acid ($C_6H_5SO_3H$) | Too great to measure |
| Sulphuric acid ($H_2SO_4$) | Too great to measure |
| Hydrochloric acid (HCl) | Too great to measure |
| Nitric acid ($HNO_3$) | Too great to measure |
| Bisulphate ion ($HSO_4^-$) | $1.0 \times 10^{-2}$ |
| Phosphoric acid ($H_3PO_4$) | $7.5 \times 10^{-3}$ |
| Sulphurous acid ($H_2SO_3$) | $1.3 \times 10^{-2}$ |
| Chloroacetic acid ($CH_2ClCO_2H$) | $1.38 \times 10^{-3}$ |
| Formic acid ($HCO_2H$) | $1.8 \times 10^{-4}$ |
| Acetic acid ($CH_3CO_2H$) | $1.8 \times 10^{-5}$ |
| Carbonic acid ($H_2CO_3$) | $4.3 \times 10^{-7}$ |
| Dihydrogenphosphate ion ($H_2PO_4^-$) | $6.2 \times 10^{-8}$ |
| Phenol ($C_6H_5OH$) | $1.1 \times 10^{-10}$ |
| Bicarbonate ion ($HCO_3^-$) | $4.7 \times 10^{-11}$ |
| Water ($H_2O$) | $1.8 \times 10^{-16}$ |
| Acetophenone ($C_6H_5COCH_3$) | Too small to measure |
| Triphenylmethane $(C_6H_5)_3CH$ | Too small to measure |

It should be pointed out that most of the ionization constants which cannot be measured for aqueous solution can be measured (or at least estimated) for solutions in other solvents. The strengths of some representative bases are shown in Table II.

TABLE II.—*The Ionization Constants of Selected Bases in Water (25° C)*

| Base | $K_B$ |
|---|---|
| Sodium hydroxide (NaOH) | Too great to measure |
| Guanidine ($NH_2C[NH]NH_2$) | Too great to measure |
| Diethylamine ($[C_2H_5]_2NH$) | $9.6 \times 10^{-4}$ |
| Ammonia ($NH_3$) | $1.8 \times 10^{-5}$ |
| Diethanolamine ($[C_2H_4OH]_2NH$) | $7.6 \times 10^{-7}$ |
| Diethylaniline ($C_6H_5N[C_2H_5]_2$) | $3.7 \times 10^{-8}$ |
| Aniline ($C_6H_5NH_2$) | $3.8 \times 10^{-10}$ |
| Water | $1.8 \times 10^{-16}$ |
| Urea | Too small to measure |
| Acetanilide | Too small to measure |

It should be noted that with the aid of equations (11) all the data in Tables I and II could have been presented respectively in terms of the ionization constants of the conjugate bases and acids.

The differences in acid and base strength among compounds of the types listed have to a considerable extent been accounted for. The fact that ammonia is a much stronger base than water is related to the atomic structures of nitrogen and oxygen. Oxygen, with a higher nuclear charge, does not attract the positively charged protons as strongly as does nitrogen. The fact that aniline is a weak base compared with ammonia has been ascribed to quantum mechanical resonance (*see* RESONANCE, THEORY OF), and the fact that chloroacetic acid is stronger than acetic acid has been ascribed to the electrostatic effect of the carbon-chlorine dipole.

For some purposes it is convenient to speak not of the activity of the hydronium ion but of the logarithm of that quantity.

For a discussion of this matter *see* HYDROGEN IONS.

**Nonaqueous Solvents.**—Water solutions have been more thoroughly investigated than any other solutions, but the phenomena of acidity and basicity are by no means limited to solutions in water; in fact, nonaqueous solutions exhibit a broader range of acidity and basicity than do aqueous solutions. In water solution, no acid much stronger than $H_3O^+$ can exist, for otherwise it would transfer a proton to the solvent; similarly, in water solution no base much stronger than hydroxide ion can exist since otherwise this base would react with water and accept a proton from it. For nonaqueous solvents, the classical definitions of acids and bases must be abandoned; the simplest adequate definition is that of Bronsted and Lowry.

Two solvents of particular interest, which illustrate the principles involved, are liquid ammonia (boiling at −33° C.) and pure acetic acid (b.p 118° C.) An acid dissolved in liquid ammonia reacts with the solvent according to equation (12):

$$HA + NH_3 \rightleftarrows A^- + NH_4^+. \qquad (12)$$

This equation is analogous to equation (2) for water In liquid ammonia, the ammonium ion is the solvated proton; it functions as an acid. Similarly, the amide ion, $NH_2^-$, functions as a base Solutions of the ammonium ion in liquid ammonia liberate hydrogen from active metals (*e.g.*, sodium), change the colour of indicators, conduct electricity and neutralize solutions of amide ions Both the acid in the ammonia system, $NH_4^+$, and the base, $NH_2^-$, exert strong catalytic effects on reactions carried out in ammonia.

Acids and bases function in analogous fashion in glacial acetic acid. Here the strongest possible base is the acetate ion; any stronger base reacts with the solvent

$$B + CH_3CO_2H \rightleftarrows BH^+ + CH_3CO_2^- \qquad (13)$$

Strong acids such as sulphuric ionize according to the equation

$$H_2SO_4 + CH_3CO_2H \rightleftarrows HSO_4^- + CH_3CO_2H_2^+. \qquad (14)$$

Solutions of both acids and bases in acetic acid neutralize one another, conduct electricity and strongly catalyze chemical reactions.

A valuable acidity scale has even been constructed for sulphuric acid as a solvent; many of the important chemical properties of this acid have thereby been correlated and explained.

**ACINACES,** from the Greek. An ancient Persian sword, short and straight, and worn, contrary to the Roman fashion, on the right side, or sometimes in front of the body, as shown in the bas-reliefs found at Persepolis Among the Persian nobility it was frequently made of gold, being worn as a badge of distinction. The acinaces was an object of religious worship with the Scythians and others (Herod., iv, 62).

**ACIREALE** (anc. Acis), town and episcopal see, province of Catania, Sicily; 9 mi. N.E. from Catania by rail Pop. (1936) 19,440 (town), 36,871 (commune). The thermal springs were used by the Romans.

Acireale took its name from the river Acis, into which Acis, the lover of Galatea, was changed after he had been slain by Polyphemus.

**ACIS,** in Greek mythology, the son of Pan (Faunus) and the nymph Symaethis, a beautiful shepherd of Sicily, the lover of the Nereid Galatea. His rival, the Cyclops Polyphemus, surprised them together and crushed him to pieces with a rock. His blood, gushing forth from beneath, was metamorphosed by Galatea into the river bearing his name (now Fiume di Jaci) (Ovid, *Met*, xiii, 750; Silius Italicus, *Punica*, xiv, 221).

**ACKER, CHARLES ERNEST** (1868–1920), U.S. inventor and manufacturer, was born in Bourbon, Ind., on March 19, 1868. Following his graduation from Cornell university in 1888 he practised electrical engineering in Chicago, Ill., until 1893. He originated a process for making caustic soda from molten salt by electrolysis and established works in Niagara Falls, N.Y., for the manufacture of soda and other chemical products. He devised various other chemical and electrochemical processes, and obtained numerous patents for his inventions pertaining to electrochemical manufacture. In recognition of his services to chemical technology he was awarded in 1902 the Elliott Cresson medal of the Franklin institute.

Acker died in Ossining, N.Y., on Oct. 18, 1920.

**ACKERMAN, FRANCIS** (*c.* 1335–1387), Flemish soldier

and diplomat, was born at Ghent. He was partly responsible for inducing Philip van Artevelde to become first captain of the city of Ghent in 1382. He secured for Ghent assistance from the citizens of Brussels, Louvain and Liège, and, as admiral of the Flemish fleet, visited England and obtained a promise of help from King Richard II.

After Artevelde's death in Nov. 1382, Ackerman acted as leader of the Flemings. He took part in the conclusion of the treaty of peace between Ghent and Philip the Bold, duke of Burgundy, in Dec. 1385 Trusting in Philip, and ignoring the warnings of his friends, Ackerman remained in Flanders and was murdered at Ghent on July 22, 1387, leaving a memory of chivalry and generosity.

*See* Jean Froissart, *Chroniques*, ed by S. Luce and G Raynaud (Paris, 1869–97); Johannes Brandon, *Chronodromon*, ed by K. de Lettenhove in the *Chroniques relatives à l'histoire de la Belgique sous la domination des ducs de Bourgogne* (Brussels, 1870).

**ACKERMANN, JOHANN CHRISTIAN GOTTLIEB** (1756–1801), German physician, was born at Zeulenroda, in Upper Saxony, on Feb. 17, 1756, and died at Altdorf on March 9, 1801. At the age of 15 he became a student of medicine at Jena under E. G. Baldinger, whom he followed to Göttingen in 1773, and later he studied for two years at Halle. A few years of practice at Stendal, 1778–99, where there were numerous factories, enabled him to add many valuable original observations to his translation, 1780–83, of Bernardino Ramazzini's (1633–1714) treatise on diseases of artificers.

In 1786 he became professor of medicine at the University of Altdorf, in Franconia, occupying first the chair of chemistry and then, from 1794 until his death in 1801, the chair of pathology and therapeutics.

He wrote *Institutiones Historiae Medicinae* (Nuremberg, 1792) and *Institutiones Therapiae Generalis* (Nuremberg and Altdorf, 1784–95), in addition to various handbooks and translations.

**ACKERMANN, LOUISE VICTORINE CHOQUET** (1813–1890), French poet, was born in Paris on Nov. 30, 1813. Educated by her father in the philosophy of the encyclopaedists, Victorine Choquet went to Berlin in 1838 to study German, and there married in 1843 Paul Ackermann, an Alsatian philologist After little more than two years of happy married life her husband died, and Mme. Ackermann went to live at Nice. In 1855 she published *Contes en vers*, and in 1862 *Contes et poésies*. Very different from these simple and charming *contes* is the work on which Mme. Ackermann's real reputation rests. She published in 1874 *Poésies, premières poésies, poésies philosophiques*, a volume of sombre and powerful verse, expressing her revolt against human suffering. Soon after the publication of this volume Mme. Ackermann moved to Paris, where she gathered round her a circle of friends, but published nothing further except a prose volume, the *Pensées d'une solitaire* (1883; Eng. trans., Glasgow, 1921), to which she prefixed a short autobiography. She died at Nice on Aug. 2, 1890.

BIBLIOGRAPHY.—Anatole France, *La Vie littéraire*, 4th series (1892); the comte d'Haussonville, *Mme. Ackermann* (1882); M. Citoleux, *La Poésie philosophique au XIX^e siècle*, vol. i (1906); O. B. P. G de Cléron, *Mme. Ackermann d'après des lettres et des papiers inédits* (1892).

**ACKERMANN, RUDOLPH** (1764–1834), Anglo-German inventor and publisher, was born on April 20, 1764, at Schneeberg, in Saxony. He had been a saddler and coachbuilder for ten years in different German cities and in Paris and London, when, in 1795, he established a print shop and drawing school in the Strand. Ackermann set up a lithographic press, and applied it in 1817 to the illustration of his *Repository of Arts, Literature, Fashions, etc.* (monthly until 1828). Thomas Rowlandson and other distinguished artists were regular contributors. He also introduced the fashion of the once popular English annuals, beginning in 1825 with *Forget-Me-Not;* and he published many illustrated volumes of topography and travel—*The Microcosm of London* (1808–11), *Westminster Abbey* (1812), *The Rhine* (1820), *The World in Miniature* (1821–26), etc. Ackermann was an enterprising man; he patented (1801) a method for rendering paper and cloth waterproof, erected a factory at Chelsea for the purpose and was one of the first to illuminate his own premises with gas Indeed, the introduction of lighting by gas owed much to him After the battle of Leipzig Ackermann collected nearly £250,000 for German sufferers He died at Finchley, Middlesex, on March 30, 1834

**ACKNOWLEDGMENT**, an admission that something has been given or done, a term used in law in various connections The acknowledgment of a debt, if in writing signed by the debtor or his agent, is sufficient to take it out of the statutes of limitations. The signature to a will by a testator, if not made in the presence of two witnesses, may be afterward acknowledged in their presence The acknowledgment by a woman married before 1882 of deeds for the conveyance of real property, not her separate property, requires to be made by her before a judge of the high court, or of a county court, or before a perpetual or special commissioner. Before such an acknowledgment can be received, the judge or commissioner is required to examine her apart from her husband, touching her knowledge of the deed, and to ascertain whether she freely consents. In some British colonies this acknowledgment applies even to separate estates An acknowledgment to the right of the production of deeds of conveyance is an obligation on the vendor, when he retains any portion of the property to which the deeds relate, and is entitled to retain the deeds, to produce them from time to time at the request of the person to whom the acknowledgment is given, to allow copies to be made and to undertake for their safe custody (Conveyancing act, 1881, section 9). The term acknowledgment is, in the United States, applied to the certificate of a public officer that an instrument was acknowledged before him to be the deed or act of the person who executed it. Acknowledgment money was the sum paid in some parts of England by copyhold tenants on the death of the lord of the manor.

**ACKTÉ, AÏNO** (1876–1944), Finnish opera singer, was born at Helsingfors (Helsinki) Aug. 23, 1876. Her studies took place in Paris. In 1897 she made her debut in *Faust* at the Paris Grand Opéra. From 1904 to 1906 she was principal soprano at the Metropolitan Opera house, and from 1907 to 1910 at Covent Garden, London. In 1910 she achieved a great personal triumph at Covent Garden in the title role of Richard Strauss's *Salome*, and was invited by the composer to perform that role in Dresden, Ger , and Paris. In 1911 she founded the annual Finnish Opera festival at Savonlinna, and in 1938 was appointed general manager of the National Opera in Finland. She had a voice of great power, range and flexibility. She died at Helsinki Aug. 8, 1944. (D. E.)

**ACLAND, SIR HENRY WENTWORTH,** BART. (1815–1900), English physician and man of learning, was born near Exeter on Aug. 23, 1815, and died at Oxford on Oct. 16, 1900.

Educated at Harrow and at Christ Church, Oxford, he was elected fellow of All Souls college in 1840, and then studied medicine in London and Edinburgh. Returning to Oxford, he was appointed Lee's reader in anatomy at Christ Church in 1845, and in 1851 Radcliffe librarian and physician to the Radcliffe infirmary. He was regius professor of medicine at Oxford from 1858 to 1894. He was also a curator of the university galleries and of the Bodleian library, and from 1858 to 1887 he represented his university on the General Medical council, serving as president from 1874 to 1887. Acland took a leading part in the revival of the Oxford medical school and in introducing the study of natural science into the university. The establishment of the Oxford university museum, opened in 1861, as a centre for the encouragement of the study of science, especially in relation to medicine, was largely the result of his efforts. "To Henry Acland," said his lifelong friend, John Ruskin, "physiology was an entrusted gospel of which he was the solitary preacher to the heathen" at Oxford. Acland published a study of the outbreak of cholera at Oxford in 1854, together with various pamphlets on sanitary matters, and served on the royal commission on sanitary laws in England and Wales in 1869.

See *Sir Henry Wentworth Acland*, a memoir by J. B. Atlay, with portraits (1903).

**ACME,** the highest point attainable. (Gr. ἀκμή, "point.")

**ACMITE,** or AEGIRITE: *see* PYROXENE.

**ACNE** is a skin disease which has no specific aetiology. It is an inflammation located in and around the hair follicles and sebaceous glands of the skin It is not peculiar to any age or to either sex, although certain age groups are more susceptible; it occurs more frequently at the time of puberty and in early adult life. The disease is related in a measure to diet and to hormonal activity. It may be an accumulation of sebaceous material within the follicles but there also may be superimposed infection with more or less marked inflammation and resultant scar formation. The more severe form is known as acne vulgaris The principles of treatment are based upon a proper diet, personal hygiene and medication as prescribed by a physician. Some drugs, the bromides and iodides, cause acniform lesions

The term acne rosacea is used to describe an inflammation of skin of a chronic nature which is not related to the ordinary form of acne In this disease there is marked redness of the nose and cheeks and sometimes inflammation with suppuration and disfigurement. The treatment is not always satisfactory and should be supervised by someone skilled in the treatment of skin disorders. (*See* also SKIN DISEASES) (F. L. A)

**ACOELOMATA,** a word sometimes used in zoology in contradistinction to Coelomata (*q.v.*) to denote those animals in which no second body cavity (coelom, *q v.*) is present. In the usage adopted by Hyman (1940) the group includes only the Platyhelminthes (*q v.*) and Nemertinea (*see* NEMERTEA).

**ACOEMETI,** an order of Eastern monks who celebrated the divine service without intermission day or night (Gr. ἀκοίμητος, sleepless). This was done by dividing the communities into choirs, which relieved each other by turn in the church. Their first monastery was established on the Euphrates in the beginning of the 5th century. In Constantinople (*c.* 460) the famous monastery of the Studium, founded by the consular Studius, was put in the hands of the Acoemeti and became their chief house, so that they were sometimes called Studites.

BIBLIOGRAPHY.—See Smith and Cheetham, *Dictionary of Christian Antiquities;* Herzog-Hauck, *Realencyklopadie* (3rd ed.); etc.

**ACOLYTE,** the highest of the four minor orders in the Roman Church (Gr. ἀκόλουθος, follower). The office is unknown in the Eastern Church, except among the Armenians who borrowed it from the West. Before the Council of Nicaea (325) it was only found at Rome and Carthage. In 251, Pope Cornelius, in a letter to Fabius of Antioch, mentions among the Roman clergy 42 acolytes, placing them next after the subdeacons (Eusebius, *Hist. Ecc.* vi. 43), giving no hint that the office was a new one. The *Liber Pontificalis* says that Pope Victor (186–197) made *sequentes cleros,* a term which may possibly denote acolytes. While the office was well known in Rome, it was evidently not at first an order through which, as to-day, every candidate to the priesthood must pass. St. Cyprian of Carthage (200?–258) used acolytes to carry his letters, but this seems to be the only place in Africa where they were known. The Irish Church did not know them; and in Spain the Council of Toledo (400) makes no mention of them. The *Statuta Ecclesiae Antiqua,* a Gallican collection for the province of Arles, early 6th century, mentions the acolyte, but does not give, as for the other orders, any form of ordination. The Roman books are silent, and in the *Leonine Sacramentary* and the so-called *Gelasian Mass-book* there is the same silence, though one ms. of the 10th century, given by Muratori, contains a form of ordination of an acolyte. The office is often mentioned in the *Ordines Romani,* but only in *Ordo* VIII. (not earlier than 7th century) do we find a very simple form for admitting an acolyte to his office. The evidence available, therefore, indicates that the acolyte was only a local office, not a necessary step to sacred orders. In England, acolytes first occur, both as office and order, in the Pontifical attributed to Egbert of York (732–766); and Aelfric (1006) in both his pastoral epistle and canons mentions the acolyte. It would seem, then, that the acolyte became an order in the Gallican Church first, and afterwards found its way as such into the Roman books before the fusion of the two rites under Charlemagne.

The duties of the acolyte, as given in the Roman Pontifical, are identical with those mentioned in the *Statuta Ecclesiae Antiqua* of Arles: "to carry the candlesticks, to light the lamps of the church, to administer wine and water for the Eucharist" The *Ordines Romani* divides the acolytes into *Palatini,* who served the pope at the Lateran palace, *Stationarii,* who served at churches where there was a "station," and *Regionarii,* or those attached directly to the regions; and gives us a glimpse of their duties. When the pope rode in procession to the station an acolyte walked before him, bearing the holy chrism; and at the church seven acolytes with candles went before him to the altar, while two others, bearing the vessel that contained a consecrated Host, presented it for his adoration. At the communion the acolytes received in linen bags the consecrated Hosts to carry to the assisting priests. The official dress of the acolyte (*Ordo* V.) was a close-fitting linen garment (*camisia*), a napkin hanging from the left side, a white tunic, a stole (*orarium*) and a chasuble (*planeta*) which he took off when he sang on the steps of the *ambo.*

At the present day the duties of acolytes are now performed, almost everywhere, by laymen. The office has been revived unofficially in the Church of England, as a result of the Tractarian movement.

**ACOMA,** a tribe and town of the Pueblo Indians in New Mexico, forming an isolated western settlement of the Keres stock. The town is strikingly situated on a mesa rising 350ft sheer above the surrounding plain, in which lie the Pueblo farmlands at a distance of some miles. It is reputed to be the oldest inhabited settlement in the United States, a distinction which, however, may be challenged by Zuñi and Oraibi. Discovered by Coronado's army in 1540, Acoma surprised and defeated a Spanish detachment in 1598, lost heavily in its subjugation next year, received a permanent mission early in the 17th century, rebelled with the other Pueblos in 1680, but was reconquered. The original population was perhaps 1,000, the present one is about 500

**ACOMINATUS** (AKOMINATOS), **MICHAEL** (*c.* 1140–1220), Byzantine writer and ecclesiastic, was born at Chonae (the ancient Colossae). He studied at Constantinople, and about 1175 was appointed archbishop of Athens. After the capture of Constantinople by the Franks and the establishment of the Latin empire (1204), he retired to the island of Ceos, where he died. He wrote homilies, speeches and poems which, with his correspondence, throw considerable light upon the miserable condition of Attica and Athens at the time. His memorial to Alexis III. Angelus on the abuses of Byzantine administration, the poetical lament over the degeneracy of Athens, and the monodes on his brother Nicetas and Eustathius, archbishop of Thessalonica, deserve special mention.

BIBLIOGRAPHY.—Edition of his works by S. Lambros (1879–80); Migne, *Patrologia Graeca,* cxl.; *see* also A. Ellissen, *Michael Akominatos* (1846), containing several pieces with German translation; F. Gregorovius, *Geschichte der Stadt Athen im Mittelalter,* i. (1889); G. Finlay, *History of Greece,* iv. p. 133–134, (1877).

His younger brother, NICETAS (Niketas), sometimes called CHONIATES, who accompanied him to Constantinople, held several appointments under the Angelus emperors (amongst them that of "great logothete" or chancellor) and was governor of the "theme" of Philippopolis at a critical period. After the fall of Constantinople he fled to Nicaea, where he settled at the court of the emperor Theodorus Lascaris, and devoted himself to literature. He died between 1210 and 1220. His chief work is his *History,* in 21 books, of the period from 1180 to 1206. In spite of its florid style, it is of considerable value as a record (on the whole impartial) of events of which he was either an eye-witness or had heard at first hand. Its most interesting portion is the description of the capture of Constantinople. The little treatise *On the Statues* destroyed by the Latins (perhaps, as we have it, altered by a later writer), is of special interest to the archaeologist. His dogmatic work (Θησαυρὸς Ὀρθοδοξίας, *Thesaurus Orthodoxae Fidei*), extant in a complete form in ms, is one of the

chief authorities for the heresies of the 12th century.

**ACONCAGUA,** a province in the northern part of central Chile, bounded on the north by Coquimbo, east by Argentina, south by Santiago and Valparaiso, and west by the Pacific. In 1928, at which time the province annexed Valparaiso, its area was 7,180 sq.mi. During the '30s, however, the geographical limits of many of the provinces were redefined, with the result that Valparaiso was again made a separate province, the territory of Coquimbo was expanded, and the area of Aconcagua was reduced to 3,940 sq mi.; population (1940 census), 118,049. The surface of the land is for the most part mountainous, interrupted by broad valleys, including the northern reaches of the famous Central valley of Chile, which lies between the coastal ranges and the piedmont alluvial slopes of the Andes. The major valleys, however, are transverse and include those of the Aconcagua and Ligua rivers, together with those of their tributaries. Climatically the province lies in a transitional zone between the arid northern part of Chile and the subhumid central part. The annual rainfall, which amounts to but a few inches, coincides with the winter season; summers are rainless, but the drought is mitigated somewhat along the coast by the presence of persistent fogs. Inland the skies are clear in summer and the temperatures are high. The natural vegetation (cacti, scrub and grasses) resembles closely the *chaparral* of the southwestern Pacific area of the United States, or the *maqui* of Mediterranean Europe. The valleys are highly fertile, and where irrigation is employed crops of alfalfa, wine grapes, fruits and vegetables are produced in abundance. San Felipe, capital of the province, is on the Río Aconcagua in a rich agricultural centre, connected by rail (Transandine railway) with Valparaiso (80 mi.), and by rail and car with Mendoza, Argentina.

**ACONCAGUA,** an extinct volcano in the southern Andes with a height of 22,835 ft., usually regarded as the loftiest mountain in America. It is situated on the boundary line between Chile and Argentina in 32° 39′ S. and 70° 1′ W. On its southern slope is the source of the Aconcagua river which flows westerly to the Pacific ocean through a course of about 200 miles. The summit of Aconcagua was first scaled in 1897 by Vines and Zurbriggen of the FitzGerald expedition.

BIBLIOGRAPHY.—Edward Ambrose FitzGerald, "Exploration on and around Aconcagua," *Geographic Journal,* vol xii, pp 469–494 (1898) and "The First Ascent of Aconcagua," *McClure's Magazine,* vol. xi (1898); Sir William Martin Conway, *Aconcagua and Tierra del Fuego* (1902).

**ACONCIO, GIACOMO** (1492–1566?), pioneer of religious toleration, was one of the Italians, like Peter Martyr and Bernardino Ochino, who repudiated Roman Catholic doctrine and ultimately found refuge in England, where he worked as an engineer on various public works. Before reaching England he had published a treatise on the methods of investigation, *De Methodo, hoc est, de recte investigandarum tradendarumque Scientiarum ratione* (1558); and his critical spirit placed him outside all the recognized religious societies of his time.

On his arrival in London he had joined the Dutch Reformed Church in Austin Friars, but he was "infected with Anabaptistical and Arian opinions" and was excluded from the sacrament by Grindal, bishop of London. The real nature of his heterodoxy is revealed in his *Stratagemata Satanae* (1565). The "stratagems of Satan" are the dogmatic creeds which rent the Christian church. Aconcio sought to reduce dogma to a minimum in the hope of finding a common denominator for the various creeds.

**ACONITE** (*Aconitum*), a genus of plants belonging to the Ranunculaceae, the buttercup family, commonly known as aconite, monkshood or wolfsbane, and embracing about 60 species, chiefly natives of the mountainous parts of the northern hemisphere. They are distinguished by having one of the five blue or yellow coloured sepals (the posterior one) in the form of a helmet; hence the English name monkshood. Two of the petals placed under the hood of the calyx are supported on long stalks, and have a hollow spur at their apex, containing honey. They are handsome plants, the tall stem being crowned by racemes of showy flowers. *Aconitum napellus,* common monkshood, is a doubtful native of Britain, and is of therapeutic and toxicological importance. Its roots have occasionally been mistaken for horse-radish. The aconite has a short underground stem, from which dark-coloured tapering roots descend. The crown or upper portion of the root gives rise to new plants. When put to the lip, the juice of the aconite root produces a feeling of numbness and tingling. The horse-radish root, which belongs to the family Cruciferae, is much longer than that of the aconite, and it is not tapering; its colour is yellowish, and the top of the root has the remains of the leaves on it.

Many species of aconite are cultivated in gardens, some having blue and others yellow flowers. *Aconitum lycoctonum,* wolfsbane, is a yellow-flowered species common on the Alps of Switzerland. The roots of *Aconitum ferox* supply the famous Indian (Nepal) poison called bikh, bish or nabee. It contains considerable quantities of the alkaloid pseudaconitine, which is the most deadly poison known. *Aconitum palmatum* yields another of the celebrated bikh poisons. The root of *Aconitum luridum,* of the Himalayas, is said to be as virulent as that of *A. ferox* or *A napellus.* As garden plants the aconites are very ornamental, hardy perennials. They thrive well in any ordinary garden soil, and will grow beneath the shade of trees. They are easily propagated by divisions of the root or by seeds.

**Chemistry.**—The active principle of *Aconitum napellus* is the alkaloid aconitine, first examined by P. L. Geiger and Hesse (*Ann,* 1834, 7, p. 267). Alder Wright and A. P. Luff obtained apoaconitine, aconine and benzoic acid by hydrolysis; while, in 1892, C. Ehrenberg and A. Purfürst (*Journ. Prat. Chem,* 1892, 45, p. 604) observed acetic acid as a hydrolytic product. This, and allied alkaloids, have formed the subject of many investigations by Wyndham Dunstan and his pupils in England, and by Martin Freund and Paul Beck in Berlin. But their constitution is not yet solved, there even being some divergence of opinion as to their empirical formulae. Aconitine ($C_{33}H_{45}NO_{12}$, according to Dunstan; $C_{34}H_{47}NO_{11}$, according to Freund) is a crystalline base, soluble in alcohol, but very sparingly in water; its alcoholic solution is dextrorotatory, but its salts are laevorotatory. When heated it loses water and forms pyraconitine. Hydrolysis gives acetic acid and benzaconine, the chief constituent of the alkaloids picraconitine and napelline; further hydrolysis give aconine. Pseudaconitine, obtained from *Aconitum ferox,* gives on hydrolysis acetic acid and veratryl-pseudaconine, the latter of which suffers further hydrolysis to veratric acid and pseudaconine. Japaconitine, obtained from the Japanese aconites, known locally as "kuza-uzu," hydrolyses to japbenzaconine, which further breaks down to benzoic acid and japaconine. Other related alkaloids are lycaconitine and myoctonine which occur in wolfsbane, *Aconitum lycoctonum.* The usual test for solutions of aconitine consists in slight acidulation with acetic acid and addition of potassium permanganate, which causes the formation of a red crystalline precipitate. In 1905, Dunstan and his collaborators discovered two new aconite alkaloids, indaconitine in "mohri" (*Aconitum chasmanthum,* Stapf), and bikhaconitine in "bikh" (*Aconitum spicatum*); he also proposes to classify these alkaloids according to whether they yield benzoic or veratric acid on hydrolysis (*Jour. Chem. Soc.,* 1905, 87, pp. 1620, 1650).

From the root of *Aconitum napellus* are prepared a liniment and a tincture. The dose of the latter (Brit. Pharmacop.) is of importance as being exceptionally small, for it is not advisable to give more than at most five drops at a time. The official preparation is an ointment which contains one part of the alkaloid

in fifty It must be used with extreme care, and in small quantities, and it must not be used at all where cuts or cracks are present in the skin.

**Pharmacology of Aconite and Aconitine.**—Aconite first stimulates and later paralyses the nerves of pain, touch and temperature, if applied to the skin, broken or unbroken, or to a mucous membrane, the initial tingling therefore gives place to a long-continued anaesthetic action. Taken internally aconite acts very notably on the circulation, the respiration and the nervous system. The pulse is slowed, the number of beats per minute being actually reduced, under considerable doses, to 40, or even 30, per minute. The blood-pressure synchronously falls, and the heart is arrested in diastole. Immediately before arrest the heart may beat much faster than normally, though with extreme irregularity, and in the lower animals the auricles may be observed occasionally to miss a beat, as in poisoning by veratrine and colchicum. The action of aconitine on the circulation is due to an initial stimulation of the cardio-inhibitory centre in the medulla oblongata (at the root of the vagus nerves), and later to a directly toxic influence on the nerve-ganglia and muscular fibres of the heart itself. The fall in blood-pressure is not due to any direct influence on the vessels. The respiration becomes slower owing to a paralytic action on the respiratory centre and, in warm-blooded animals, death is due to this action, the respiration being arrested before the action of the heart. Aconite further depresses the activity of all nerve-terminals, the sensory being affected before the motor. In small doses it therefore tends to relieve pain, if this be present. The activity of the spinal cord is similarly depressed. The pupil is at first contracted and afterwards dilated. The cerebrum is totally unaffected by aconite, consciousness and the intelligence remaining normal to the last. The antipyretic action which considerable doses of aconite display is not specific, but is the result of its influence on the circulation and respiration and of its slight diaphoretic action.

**Therapeutics.**—The indications for its employment are limited, but definite. It is of undoubted value as a local anodyne in sciatica and neuralgia, especially in ordinary facial or trigeminal neuralgia. The best method of application is by rubbing in a small quantity of the aconitine ointment until numbness is felt, but the costliness of this preparation causes the use of the aconite liniment to be commonly resorted to. This should be painted on the affected part with a camel's hair brush dipped in chloroform, which facilitates the absorption of the alkaloid. Aconite is indicated for internal administration whenever it is desirable to depress the action of the heart in the course of a fever Formerly used in every fever, and even in the septic states that constantly followed surgical operation in the pre-Listerian epoch, aconite is now employed only in the earliest stage of the less serious fevers, such as acute tonsillitis, bronchitis and, notably, laryngitis. The extreme pain and rapid swelling of the vocal cords—with threatened obstruction to the respiration—that characterize acute laryngitis may often be relieved by the sedative action of this drug upon the circulation. In order to reduce the pulse to its normal rate in these cases, without at the same time lessening the power of the heart, the drug must be given in doses of about two minims of the tincture every half-hour and then every hour until the pulse falls to the normal rate. Thereafter the drug must be discontinued. It is probably never right to give aconite in doses much larger than that named. There is one condition of the heart itself in which aconite is sometimes useful. While absolutely contraindicated in all cases of valvular disease, it is of value in cases of cardiac hypertrophy with over-action. But the practitioner must be assured that neither valvular lesion nor degeneration of the myocardium is present.

**Toxicology.**—In a few minutes after the introduction of a poisonous dose of aconite, marked symptoms supervene. The initial signs of poisoning are referable to the alimentary canal. There is a sensation of burning, tingling and numbness in the mouth, and of burning in the abdomen Death usually supervenes before a numbing effect on the intestine can be observed. After about an hour there is severe vomiting. Much motor weakness and cutaneous sensations similar to those above described soon follow. The pulse and respiration steadily fail, death occurring from asphyxia. As in strychnine poisoning, the patient is conscious and clear-minded to the last. The only post-mortem signs are those of asphyxia. The treatment is to empty the stomach by tube or by a non-depressant emetic. The physiological antidotes are atropine and digitalin or strophanthin, which may be injected subcutaneously in maximal doses. Alcohol, strychnine and warmth must also be employed.

**ACONITINE:** *see* ACONITE.

**ACONTIUS,** in Greek legend, a beautiful youth of the island of Ceos. During the festival of Artemis, at Delos, Acontius saw and loved Cydippe, a well-born Athenian maiden. He wrote on an apple the words, "I swear to wed Acontius" and threw it at her feet. She picked it up, and mechanically read the words aloud, thus binding herself by an oath. Therefore, although she was betrothed more than once, she always fell ill before the wedding took place. The Delphic oracle at last explained the matter, and she married Acontius.

(Callimachus, *Aitia,* III, 1 Mair; *see* his notes [p. 204 of the Loeb ed.] for other authorities.)

**ACORN,** the fruit of the oaks (*Quercus*) and tanbarks (*Lithocarpus*); a word also used, by analogy with the shape, in nautical phraseology for a piece of wood keeping the vane on the mast-head.

**ACORN SHELLS,** popular English name given to sessile forms of barnacles (*q.v.*) common on rocks, piers, etc., on sea coasts; in America often called rock-barnacles. (*See* CIRRIPEDIA.)

**ACORUS CALAMUS,** sweet-sedge or sweet-flag, a marsh plant which shares with the cuckoo pint (*Arum*) the representation in Britain of the family Araceae and is found throughout the north temperate zone. The name is derived from *acorus,* Gr. ἄκορος, the classical name for the plant. It was the *Calamus aromaticus* of the mediaeval druggists and perhaps of the ancients, though the latter has been referred by some to citronella grass, *Cymbopogon nardus.*

The plant is a herbaceous perennial with a long, branched rootstock creeping through the mud, about ¾ inch thick, with short joints and large brownish leaf-scars.

The leaves are tufted, flat, sword-like, sweet-scented, 3 or 4 ft. long and about an inch wide, closely arranged in two rows as in the true Flag (*Iris*); the tall flowering stems (scapes), which very much resemble the leaves, bear an apparently lateral, blunt, tapering, spike-like cluster (spadix) of densely packed, very small flowers.

A long leaf (spathe) borne immediately below the cluster forms an apparent continuation of the scape, though really a lateral outgrowth from it, the spadix being terminal. The rootstock yields the drug calamus, and a variegated form is cultivated for ornament.

**ACOSMISM.** This term was coined by Fichte and Hegel on the model of the term atheism. According to the ordinary view, reality consists of God and a world (cosmos) of finite objects usually conceived as having been created by Him and made to conform to certain laws. Now atheism is the theory which denies the existence of God, and so identifies reality with a godless world of objects and events which exist of themselves and have an inherent order of their own. Acosmism is the contrary view that denies the independent reality of a world of finite objects and events, and regards God as the sole ultimate reality. In accordance with the common practice of denouncing anybody as an atheist whose conception of God was different from theirs, Spinoza was generally described as an atheist by his contemporaries and others Hegel protested against the injustice of this. Spinoza, he said, was so far from denying the existence of God that he acknowledged no other ultimate reality—so far from being an atheist he was an acosmist. Fichte similarly applied the term to himself in reply to similar accusations. The term acosmism has since been applied also to philosophies like those of the Vedanta, of Buddhism, and of Schopenhauer. Apart from its polemical uses the term acosmism, with its suggestion of an illusory world, is not a happy equivalent of the term pantheism Strictly speaking, a pantheism like that of Spinoza no more denies the reality of

the world than it denies the reality of God. It simply identifies the universe with God, and for that very reason regards the universe all the more as a world of order, a real *cosmos*. Moreover, there is an important sense in which pantheism is essentially *cosmic*, namely, in the sense that it regards man from the standpoint of the universe, instead of regarding the universe from the point of view of man (*see* ANTHROPOCENTRIC PHILOSOPHY). "Acosmism" is therefore not only an inadequate, but also a misleading description of pantheism.

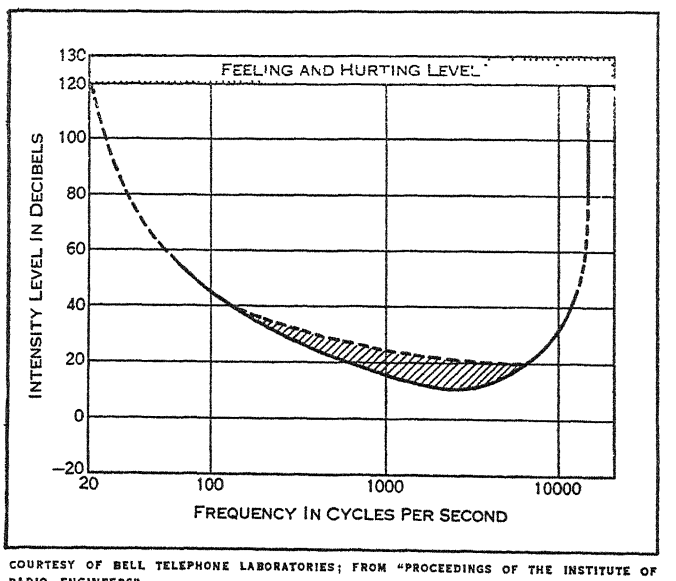
**ACOSTA, JOAQUIN** (*c.* 1795–1852), Colombian historian and soldier, was an officer in Bolivar's army, and a member of congress. He travelled in Colombia and in Spain, collecting material for his *Compendio histórico del descubrimiento y colonización de la Nueva Granada*, which was published in Paris in 1848

**ACOSTA, JOSÉ DE** (1539?–1600), Spanish author, was born at Medina del Campo about the year 1539. He joined the Jesuits in 1551, and in 1571 was sent as a missionary to Peru; he acted as provincial of his Order from 1576 to 1581, was appointed theological adviser to the Council of Lima in 1582, and in 1583 published a catechism in Quichua and Aymara—the first book printed in Peru In 1598 he became rector of the Jesuit college at Salamanca, where he died on Feb. 15, 1600. His treatise, *De natura novi orbis libri duo* (Salamanca, 1588–89), may be regarded as the preliminary draft of his celebrated *Historia natural y moral de las Indias* (Seville, 1590), which was speedily translated into Italian (1596), French (1597), Dutch (1598), German (1601), Latin (1602), and English (1604). The *Historia* is in three sections. books I and II deal with generalities; books III and IV with the physical geography and natural history of Mexico and Peru; books V, VI, and VII, with the religious and political institutions of the aborigines. Apart from his sophistical defense of Spanish colonial policy, de Acosta deserves high praise as an acute and diligent observer. Among his other publications is *De procuranda salute Indorum libri sex* (Salamanca, 1588).

BIBLIOGRAPHY.—Edward Grimston's translation of the *Historia* reprinted (1880) for the Hakluyt Society, with introduction and notes by Sir Clements R. Markham; C Sommervogel, *Bibliothèque de la Compagnie de Jésus, Première Partie* (1890), vol. i, col. 31–42; José R. Carricido, *El P. José de Acosta y su importancia en la literatura científica española* (1899).

**ACOSTA, URIEL** (d. 1647), Jewish author, was born at Oporto near the end of the 16th century. Educated in the Roman Catholic faith, he was received into the synagogue at Amsterdam and exchanged his baptismal name of Gabriel for Uriel. His wayward disposition, however, found no satisfaction in Judaism. He was twice excommunicated, and twice readmitted to the synagogue. In his autobiography, *Exemplar humanae vitae*, printed in 1687 and again in 1847, Acosta declared his hostility both to Christianity and Judaism, but spoke most bitterly of Judaism. He committed suicide in 1647. The story of Acosta's life provided K. F. Gutzkow with the material of the tragedy of *Uriel Acosta* (1847).

**ACOUSTICS OF BUILDINGS** is that part of the science of sound which deals with the production, transmission and absorption of sound in buildings. The primary use of the findings of this science is in the acoustical design of buildings to minimize noise, that is, unwanted sounds, and to transmit wanted sounds to listeners undistorted and with sufficient intensity. Attempts to attain these ideals involve a consideration of the noise to be controlled, the reduction of mechanical disturbances, the soundproofing of building constructions and the acoustical adjustment of rooms for listening. The following discussion will take up these topics in the order named, assuming the statements of the general principles of acoustics and hearing, as given in the articles on SOUND and HEARING.



**Noise.**—Sources of noise, which may be either inside or outside buildings, are such things as typewriters, radios, auto horns, whistles and talking; these sources create sounds that travel in the air. Other sources set up vibrations in the structure of the building, either directly, as when machines are attached to the structure, or indirectly, as when vehicles or drilling devices set up vibrations in the ground which are transmitted into the building. To protect listeners in the building, it is necessary to interpose discontinuities in the paths of these disturbances. Table I shows that the range of sounds, which must be tolerated by the ear, is enormous, extending from a "threshold" value of one arbitrary unit for a faint sound that can just be detected to 1,000,000,000,000 units for a very loud sound.

TABLE I.—*Intensity of Sound*

| Units | Decibels | Type of Noise |
|---|---|---|
| 1,000,000,000,000 | 120 | |
| 100,000,000,000 | 110 | Aeroplane engine |
| 10,000,000,000 | 100 | |
| 1,000,000,000 | 90 | Heavy traffic, pneumatic drill |
| 100,000,000 | 80 | |
| 10,000,000 | 70 | Noisy office, telephone conversation, ordinary traffic |
| 1,000,000 | 60 | |
| 100,000 | 50 | Average office |
| 10,000 | 40 | Ordinary conversation |
| 1,000 | 30 | Quiet home, quiet conversation |
| 100 | 20 | |
| 10 | 10 | Rustle of leaves, whisper |
| 1 | 0 | |

Smaller numbers to express this vast range have been developed by using the *decibel* unit, the number of decibels between two intensity levels being obtained by taking ten times the logarithm of the ratio of the intensities. Although the tolerable range is very great, the absolute energy of sounds is very small, an average voice having only about one-millionth of the energy needed to operate an ordinary electric lamp

**Hearing.**—Since any control of sound in buildings is made for the convenience and comfort of the occupants, the acoustician should consider the performance of the ear and the phenomena of hearing when making any adjustments. Extensive experiments in this connection have been made by the Bell Telephone Laboratories because of the importance of speech and hearing in telephony. Harvey Fletcher published data obtained by young persons with normal hearing, showing the frequency and intensity limits of sounds that can be perceived without discomfort (*Speech and Hearing*, 1929). In 1942 Fletcher published an important article (*Proc. Inst. Radio Eng.*, June, 1942) based on (1) Measurements of the threshold and frequency limits of more than 500,000 people at the New York and San Francisco world's fairs in 1940; (2) Measurements of the discomfort level of sound; (3) Measurements of room noise in a wide variety of locations, and (4) Measurements of the frequency limits and the maximum and minimum levels of speech, orchestral music, and the various instruments of the orchestra. Some of the results of the first two sets of measurements are shown in Fig. 1, which gives the limits of hearing of the average listener (50% of the listeners tested at the world's fairs) under quiet condi-

COURTESY OF BELL TELEPHONE LABORATORIES; FROM "PROCEEDINGS OF THE INSTITUTE OF RADIO ENGINEERS"

FIG. 1.—LIMITS OF HEARING AND ROOM NOISE

tions. The lower curve shows the hearing threshold for pure tones for the average listener, while the line of 120 decibels gives the upper limit, above which sounds become uncomfortably

loud and even harmful. The area enclosed between these two limits, called the average auditory sensation area, gives the range of sounds as to frequency and intensity which can be heard comfortably by the average listener; it therefore determines the range within which noise is audible and also the range within which wanted sounds must lie if they are to be heard. Any noise which is present in sufficient intensity and which lies above the threshold curve, encroaches and limits the useful auditory sensation area. The shaded area indicates the extent, according to Fletcher, to which noise in average residences and average motion-picture theatres reduces the area. In the average business office, the encroachment is approximately 15 decibels more, and in the average factory location, it is 35 decibels more. Guided by the information in Fig 1, the acoustician is concerned to reduce noise so as to keep its encroachment as small as possible and, in auditoriums, to try to push it below the lower curve.

**Vibrations** that are due to machinery and near-by street traffic can enter a building structure and cause floors to vibrate and create a rattling of loose windows, doors and other constructions. These disturbances annoy workers and reduce their efficiency. The trouble may be reduced by using "quiet-running" motors and rubber-tired vehicles. Machines should be dynamically balanced and should rest on resilient supports that "give" somewhat under the load—the popular notion that a sheet of cork under the machine will control the vibrations is misleading For low-frequency machines, the supports should be damped; for high frequencies, the supports should be elastic without damping. These details can be calculated prior to the installation of the machines (Timoshenko, *Vibrations Problems in Engineering;* J. P. den Hartog, *Mechanical Vibrations;* Slocum, *Noise and Vibration Engineering*)

**Soundproofing** involves the use of special constructions that will reduce the transmission of noise. Numerical values of the reduction of sound by partitions are obtained experimentally. Measurements are taken for the sound incident on [illegible] partition and also for the reduced sound that emerges from the other side For example, if an incident sound of 1,000,000 units intensity is reduced to 1,000 units by the partition, the decibel loss is 30 db ($10 \times \log 1{,}000{,}000/1{,}000 = 30$ db.). This means that a loud radio sound of 80 db. level in one room would be reduced 30 db. by the partition and would have only a 50 db. level in the adjoining room. Table II exhibits a few data chosen from the extensive tables published by Vern O. Knudsen (*Architectural Acoustics,* 1932), Paul Earls Sabine (*Acoustics and Architecture,* 1932) and the National Bureau of Standards (*Report BMS-17,* 1939; *Supplement to Report BMS-17,* 1940).

TABLE II.—*Effects of Various Partitions in Soundproofing*

| Partition | Weight | Sound reduction |
|---|---|---|
| Heavy wrapping paper | .016 lb per sq ft. | 2 0 db. |
| One-inch hairfelt | .75 " " " " | 5 8 " |
| One-half-inch fibre board | 75 " " " " | 19 0 " |
| Light door | | 22 0 " |
| One-quarter-inch plate glass | 3.5 " " " " | 30 0 " |
| [illegible] tile, plastered | 29 " " " " | 40 0 " |
| Four-inch wood stud, " | 15 6 " " " " | 42 0 " |
| Concrete wall, " | 26 " " " " | 42 0 " |
| Eight-inch brick wall | 87 " " " " | 50 0 " |

Inspection of the results shows that the door and the glass (window) transmit more sound than the walls do, so that it is a mistake to install highly-insulating partitions unless double doors and windows are also used This last statement is strikingly illustrated by the following example (Bureau of Standards, *ibid* p. 9): Consider a brick building containing a single room, with plastered brick walls, 8 in. thick, a plastered cement slab roof, 6 in. thick, several windows and a door. Inspection of the data shows that the windows, with only 150 sq.ft. area, transmit 2,400 units of sound energy out of the total of 2,575 units, the door transmits 67 units, while the roof and the walls, with much larger areas, transmit only 60 and 48 units respectively.

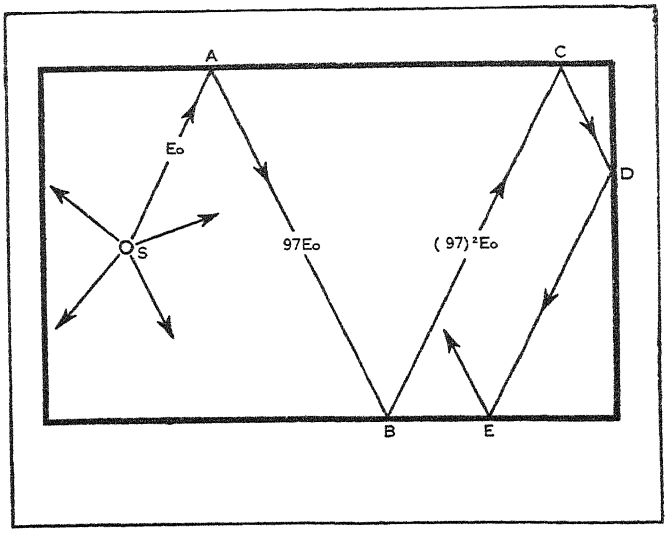
TABLE III.—*Relative Sound Transmissions of Parts of a Brick Building*

| Material | Area | Relative transmission |
|---|---|---|
| Brick walls | 1,200 sq ft. | 48 units |
| Cement roof | 600 " " | 60 " |
| Windows | 150 " " | 2,400 " |
| Door | 21 " " | 67 " |
| Total | | 2,575 |

Double partitions stop more sound than single partitions, particularly if the two elements are separated by an air space, which should be 4 in. or more thick [illegible] the air space with wood studding or packing it with sawdust or similar materials is usually detrimental. Any openings in the continuity of a wall for ventilators or pipes should be controlled, since sound passes easily through an air passage. Ventilating ducts are lined on the inside with [illegible] materials, according to definite rules formulated by [illegible] engineers Floors are more difficult to insulate [illegible] impact sounds of footsteps on ordinary floors or masonry floors can be heard almost as loudly in the room below as in the room above the floor. A floating floor on masonry with a suspended [illegible] below gave the best results. (Bureau of Standards, *ibid* p. 7 [illegible], the controlling qualities of a partition that determine its insulation are its weight and its possibility of vibration. A brick wall, because of its weight and small vibration, makes one of the best insulators, but it is too heavy and bulky for extensive use, so that many lighter and smaller partitions have been developed. These thinner units are likely to vibrate under the impact of sound and will thus transmit certain low frequencies so that they are undesirable for broadcasting rooms and [illegible] where great insulation is needed. An approximate estimation of the effect on hearing by reduction of sound is given as follows:

"With an average reduction factor of 25 db, normal speech can be understood quite easily and distinctly through the partition.

"With an average reduction factor of 30 db., loud speech can be understood fairly well if conditions are quiet.



"With an average reduction factor of 35 db., loud speech is audible, but not easily intelligible under quiet conditions

"With an average reduction factor of 40 db, normal speech is not audible, loud speech can be faintly heard but not easily understood, and for all practical purposes the partition can be considered soundproof. Separating [illegible] apartments should have a factor of about 40

"Greater insulation than 40 db. is needed to reduce loud piano and radio sounds" (Acoustical Materials Association).

It has been shown in an important paper on loudness that, except for low frequencies, a reduction of 9 decibels makes a sound appear approximately half as loud. (Fletcher and Munson, *Jour. Acous. Soc. Amer*, 9, p. 1, 1937.)

**Acoustics of Rooms** become satisfactory when the noise level is reduced, as explained in Fig 1, and adjustments are made to insure the effective production and reception of wanted sounds Fig. 2 shows how sound starts from a source S, and proceeds outward in spherical waves with a rapid velocity of about 1,100 ft. per sec On striking the boundaries of the room, sound waves are reflected, losing a little energy in the process, then they proceed to another boundary for another reflection, and so on until they become inaudible As a numerical example consider a room with a volume of 100,000 cu ft. that is [illegible] by 20,000 sq ft of hard plaster walls and a wooden floor

REPRINTED BY PERMISSION FROM "ACOUSTICS OF BUILDINGS," BY F. R. WATSON, PUBLISHED BY JOHN WILEY & SONS, INC.

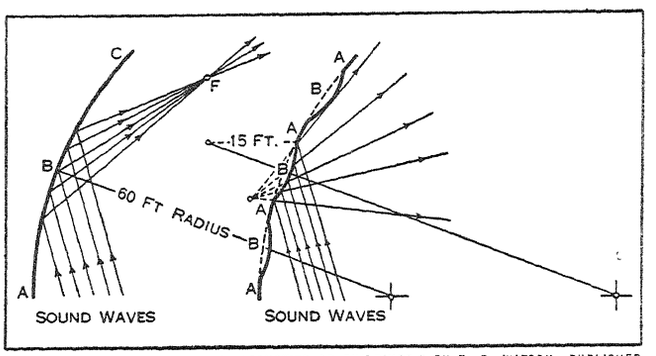
FIG. 2.—REFLECTION OF SOUND WAVES IN A ROOM

that absorb an average of 3% of the incident sound energy at each reflection Calculations show that while the sound decreases in energy to one-millionth of its initial value, it will make 461 reflections, and will travel a distance of 9,220 ft. in a "time of reverberation" of 8.22 sec. (Watson, *Acoustics of Buildings,* p. 32, 1941.) Under these conditions, the hearing will be very unsatisfactory. Before the first word of a speech dies out, several other words will have been uttered that will mix with the earlier ones, thus producing a confusion that

makes it almost hopeless for the auditor to understand what is said. The obvious correction is to make the boundaries of the room more absorptive so that the sounds will die out quicker.

When a sound persists for some time in a room, such as a tone generated by a musical instrument, the energy builds up in a very short time to a steady state in which the energy emitted per second by the instrument is just balanced by the energy absorbed in the same time by the boundaries of the room. Many reflections are then taking place, with the result that the room is filled with sound waves proceeding in every direction. While these reflections beneficially build up the loudness somewhat, they unfortunately create the usual acoustical defects found in rooms—resonances, echoes, reverberation and distortion.

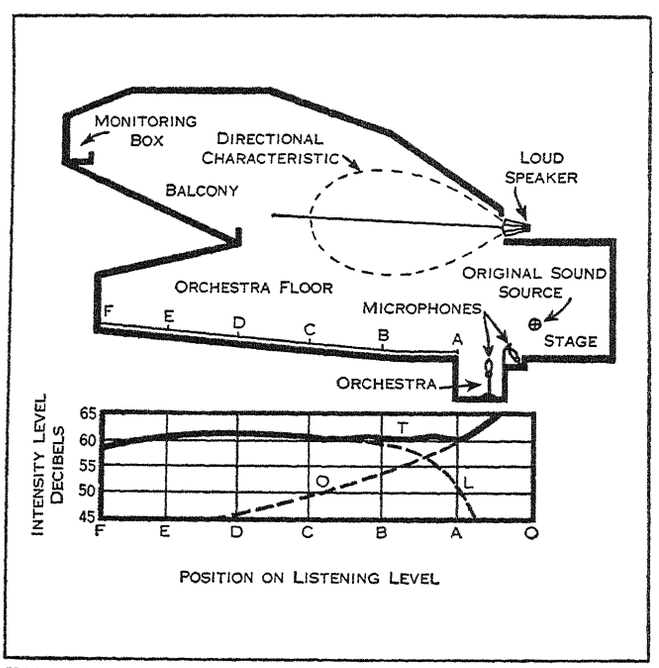
**Resonances.**—The random action of sound just described is not in exact accord with the actual conditions. It is found that portions of the sound proceeding in certain directions are likely to be amplified so as to produce resonances, as, for example, in a bath room which has highly reflecting surfaces. The frequencies, $f$, of these resonances, or 'normal modes,' is as follows.



$$f = \frac{c}{2}\left[\left(\frac{p}{l}\right)^2 + \left(\frac{q}{w}\right)^2 + \left(\frac{r}{h}\right)^2\right]^{1/2}$$

where $p$, $q$, and $r$ are numbers, 0, 1, 2, 3, etc., for different modes, $l$, $w$, and $h$ are respectively the length, width, and height of the room, and $c$ is the velocity of sound. As an example, if $q=0$, $r=0$, then $f=cp/(2l)$, which gives the normal vibrations parallel to the length of the room. If the length of the room is 10 feet, the velocity of sound 1,120 feet per second, and $p=1$, then $f=1{,}120/(2\times10)=56$ cycles per second. For $p=2$, $f=112$ cycles per second, etc. Similar vibrations can be set up parallel to the width and height of the room. Diagonal vibrations can also take place, as, for example, when $p=1$, $q=1$, and $r=0$" (*Acoustics of Buildings*, by F. R. Watson).

Knudsen states that resonances in large rooms can usually be neglected for sounds with a frequency above 100 cycles per sec., because the lowest normal modes are in the subaudible range of hearing. (*Reviews of Modern Physics*, 6, p. 9, 1934.) For smaller rooms, such as those used for broadcasting or for phonograph recording, where distortion of sound must be avoided, the resonances must be reduced. An effective means of correction is to install convex cylindrical segments in the walls and ceiling that diverge the reflected sound and produce a more uniform distribution in the room. It is also necessary to install sound-absorbing materials, such as a lined carpet, and absorbing panels of irregular shape which are located in selected positions. To avoid coincidences of resonances set up between the three sets of parallel walls, the dimensions of the room should be related by an inharmonic ratio, such as $\sqrt[3]{2}$ power, as, for example, $12.5\times20\times32$ ft. (J. E. Volkmann, *Jour. Acous. Soc. Amer.*, 13, p. 240, 1942; C. P. Boner, *ibid*, 13, p. 244.)



**Public Address System.**—Another modification of the random action of sound is brought about by the use of a public-address, or sound-amplifying, system. Thus, instead of the confused mass of weak sound of a speaker's voice that spreads out in all directions, the loud-speaker emits a powerful beam of sound that covers the area occupied by the audience. There is some reflection from the rear walls so that the room is filled with diffused sound.

The use of public-address systems introduces a new problem in acoustical control. That is, while a large part of the energy of the beam of sound from the loud-speaker is absorbed by the audience (clothing and seats), it is necessary to make provision for the drastic reduction of the reflection from the rear walls, if echoes and other sound concentrations are to be avoided. This control is brought about by designing the rear walls so that regular reflection and concentration of sound are reduced, and by installing special sound-absorbing constructions.

FIG. 5.—EFFECT OF ACOUSTICAL TREATMENT ON REVERBERATION OF SOUND IN AN AUDITORIUM

**Echoes.**—An echo is a reflected sound that reaches the auditor about one-fifteenth of a second or more after the direct sound. If the reflecting surface is curved so as to converge the sound, the resulting echo is marked and annoying. Plane walls produce weak echoes, while convex walls diverge the reflected sound and are very beneficial in reducing echoes and in producing a more uniform distribution of sound in the room. Fig. 4 pictures the concentration of sound by a curved surface (left), and shows the beneficial scattering set up by convex panels in the wall (right). The amount of curvature suggested by Potwin in 1939 is a rise of 1 in. in each 10 in. along the wall surface. A rectangular-shaped room without curves is generally preferred, with convex segments and sound-absorbing panels in critical locations

**Reverberation,** or too great prolongation of sound, is the most usual acoustical defect in auditoriums. It is a common observation that the reverberations so noticeable in an empty house disappear when the house is furnished. So, in an auditorium, an adjustment is brought about by installing a sufficient amount of sound-absorbing material, selected to give the optimal time of reverberation, and by placing it where it will be most effective Fig 5 gives a graphical representation of the acoustical adjustment of an auditorium of 80,800 cu ft. volume, with an insufficient amount of 570 units of absorption before correction, and with 2,300 units after correction. The optimal time of reverberation selected for this auditorium was taken as 1.3 sec. when an audience of 200 was to be present. The shaded area in Fig. 6

COURTESY OF ACOUSTICAL MATERIALS ASSOCIATION

FIG 6 —TIMES OF REVERBERATION FOR AVERAGE SOUND FREQUENCY

indicates the times of reverberation for the average sound frequency of 512 cycles per sec that has been used by acoustical engineers in recent years (Acoustical Materials Association, *Bulletin VIII,* 1941.) For other frequencies than 512 cycles, somewhat different times have been used. (Maxfield and Potwin, *Jour. Acous. Soc. Amer.,* 11, p. 390, 1940.)

**Sound-Absorbing Materials.**—The absorption of sound in an auditorium is a vital consideration in securing good acoustics. Installing wires is a useless procedure Irregularities in the shape of the walls, columns, coffering and similar devices may break up the regular reflection and make the resultant sound more diffuse, but absorption must take place to reduce the reverberation. Since the usual building materials used in a room are plaster, wood and glass, all of which absorb only about 3% of the incident sound, it has become necessary to develop other materials with greater absorption. Some products absorb sound when they vibrate, particularly when backed by an air space, but most materials are effective because of their porosity, by which sound energy is transformed into heat by friction in the pores.

Sound-absorbing tests are made to determine the absorption coefficients that are needed when calculating the time of reverberation. A method was developed in 1895 by Wallace Sabine to measure the time of decay of pure tones in an empty reverberation room and again when an absorbing sample was placed on the floor. (*Collected Papers on Acoustics,* 1922.) Results obtained in different laboratories by this method were not in agreement. In 1939 a number of physicists discussed a new method in which the decay of sound in a room involves the normal acoustic impedance and the normal modes of vibration ("Symposium on the Measurement of Absorption Coefficients and the Application of Acoustic Absorbents," *Jour Acous. Soc. Amer.,* 11, pp. 37–106, 1939.) A wide choice of sound-absorbing materials is now (1943) available, as illustrated by the following sample information (Acoustical Materials Association, Chicago, Illinois, *Bulletin No. VIII,* 1941, which lists many materials):

| *Frequency* | *128* | *256* | *512* | *1024* | *2048* | *Average* |
|---|---|---|---|---|---|---|
| Coefficients | 0.12 | 0.15 | 0.47 | 0.95 | 0.78 | 0.60 |

The coefficients are determined for five frequencies, and an average is taken of four of them (256–2,048) to give the noise-reduction coefficient, which is used to express the relative sound-absorbing efficiency of the material. A coefficient of 1.00 indicates 100% absorption. In addition to the data shown in the tabulation, the *Bulletin* gives the following information:

"The material is in the form of cast units having a surface composed or resembling small uniform granules. The binder may be gypsum or any other suitable mineral binder; it is ¾ inches thick; weighs 2.37 lbs./sq.ft.; is cemented to plaster board; its surface is painted white having a light reflection value of 65 per cent" (Acoustical Materials Association).

**Acoustic Field Tests** in auditoriums are conducted to ascertain to what extent the acoustic conditions will give acceptable production and hearing of speech and music. The intelligibility of speech is tested when a speaker on the stage recites a list of specially selected words, while observers in different locations in the room write down what they think they hear. For satisfactory conditions, 80% or more of the words should be heard correctly. (N A. Watson and V. O. Knudsen, *Jour. Acous. Soc. Amer.,* 11, p. 406, 1940.) The time of reverberation is measured by a high-speed level recorder that gives the time rate of decay of the sound in decibels. A sound-level meter gives the loudness in different parts of the room to determine the uniformity of distribution of sound. The performance of the sound-amplifying system and the sound effects it produces in the auditorium are investigated by a trained radio engineer—not a simple test.

**Ideal Auditorium Acoustics.**—In 1928 Floyd R. Watson proposed a theory that good acoustics in auditoriums could be expected [illegible] two rules: (1) provide a stage with reflecting surfaces so that performers can "hear themselves", and (2) design the auditorium for listening so that the reflected sound will be reduced to be comparable with "dead" outdoor conditions, but with extraneous noise controlled. (Watson, *Acoustics of Buildings,* Chap. VII, 1941.) After 1928, various developments appeared to confirm the predictions of this theory. Burris-Meyer in 1941 modified a concert stage to give it the characteristics of a small, reverberant room, and received the enthusiastic approval of the performers. (*Jour. Acous. Soc. Amer.,* 13, p. 16.) Stahl and Louden (*Jour. Acous. Soc. Amer,* 13, p 9, 1941) found a "live end-dead end" room useful for testing absorption.

Watson, *Acoustics of Buildings,* 1941; National Bureau of Standards, *Report BMS-17* and *Supplement,* 1939–40; P. M. Morse, *Vibration and Sound,* 1936; also, references in the foregoing article. (*See* also SOUND.) (F. R. W)

**ACQUI,** city and episcopal see, province of Alessandria, Italy; from the town of that name it is 21 mi. S.S.W. by rail. Pop. (1936) 9,643 (town), 18,336 (commune). Its warm sulphur springs were already famous as Aquae Statiellae in Roman times. Part of the ancient bath establishment has been found; and south of the town are lofty arches of the aqueduct which supplied it. The place was connected by road with Alba Pompeia and Augusta Taurinorum. The town possesses a fine Gothic cathedral.

**ACRANIA,** or CEPHALOCHORDATA, a subphylum of the Chordata, including only *Amphioxus* (*q.v.*) and its allies.

**ACRE.** A harbour town or city of Palestine (Egypt. *'Ak (a),* Assyr. *Akku,* Heb. *Akko,* Gr. *Ake* [Josephus, *'Arke*], Lat. *Ac(c)e;* on Crusading coins *Ac(c)on,* Arab. *'Akka*). From the 3rd century B.C. it was known as Ptolemais, perpetuating, perhaps, the name of Ptolemy II (Philadelphus) The name St. Jean d'Acre dates from the time when it was the headquarters of the Knights Hospitallers.

**Topography.**—Acre is situated on a low, rocky promontory at the northern end of the Bay of Acre. A strong wall, shot pitted, girds it to seaward, and to landward a double rampart The ancient harbour has silted up leaving now only a few feet depth of water. In the roadstead there is good anchorage for small craft. To the south of the city, broadening as it advances, stretches the formerly marshy Plain of Acre. There enters the sea not far from the city the classic river Belus (Na'mān) which of old provided, and still provides the *murex* from which the Phoenicians extracted the renowned Tyrian purple

**History.**—Acre has had a most stirring and tragic history. Its strategic position on the military highway along the coast, its proximity to the western entrance to the Plain of Esdraelon, its significance as the natural port not only for Galilee, but for Damascus and the Hauran, coupled with the peculiar military value of its site, attached to it an enduring importance, both political and commercial. The name first appears in the conquest lists of the Egyptian monarchs Thutmose III (*c.* 1500 B.C.) and Seti I (*c.* 1315 B.C.). From the Amarna dispatches of Amenhotep IV (*c.* 1375 B.C.) it would appear that the caravans of Burra-Buriash II, king of Babylonia were plundered, much to his annoyance, by the king of Acre In the Old Testament it is named (Judges 1, 31) as one of the places whence the Israelites did not drive the Canaanite inhabitants. At the beginning of the 7th century B.C.

when the Assyrian was in the pride of his strength Acre appears to have been subordinate to Tyre for a time at least, since the two names are regularly coupled in inscriptions (Sinaherib, Asarhaddon). It is first mentioned apart in the records of Ashurbanipal (668–628). During the Persian period Acre is not much in evidence. It appears, however, to have been the rendezvous for Artaxerxes Mnemon in his expedition against Egypt (Strabo cvi. 2). From this time on "for Egypt, for Asia Minor, for the Greek isles and mainland, and for Italy its harbour was the most convenient on the Syrian coast, and its history till the end of the New Testament period is that of the arrival of great men from these shores, of the muster of large armies, of the winter camps of the invaders of the Syrian hinterland, and of bitter conflicts between Greeks and Jews" (G. A. Smith). Josephus and the Books of the Maccabees record its varying fortunes. Within its walls the Syrian Greeks, routed by Simon Maccabaeus, sought refuge (164 B.C.). In the struggle for the Syrian throne, Alexander Balas wrested Acre from Demetrius (153). Jonathan was lured within its gate (Acre has only one) by Trypho and taken prisoner (143). Round about the year 104 B.C. Alexander Jannaeus laid siege to Acre but abandoned it from fear of Ptolemy Lathyrus, who besieged and took it, but was forced to yield it to his mother Cleopatra. Tigranes of Armenia stormed it (70 B.C.) but relinquished it under fear of the Romans and it surrendered without a struggle to the Parthian Pacorus (Josephus, *B.J.* i. 13). Herod entertained Caesar here and here he built a gymnasium. It was established a *colonia* by Claudius. St. Paul spent a day in Ptolemais while coasting from Tyre to Caesarea (Acts xxi. 7). In the wars with the Jews the Roman leaders realized its value as main base for their armies (Varus, Vitellius, Petronius, Cestius, Vespasian).

In Christian times Ptolemais became a bishopric and its bishop attended the great councils of the Church, Caesarea (198), Nicea (325), Constantinople (381), Chalcedon (451), Jerusalem (536). The Arabs took possession of the city in 638. Baldwin I. captured it with the aid of a Genoese fleet in 1104 (1st crusade). Saladin re-captured it in 1187 (2nd crusade). In 1191 after a siege by Guy de Lusignan of about two years, it was taken on the arrival of Richard Coeur de Lion (3rd crusade), and was finally lost in 1291. The Turks under Selim I entered into possession in 1517, after which the city fell into decay. Its revival began in 1749 with its capture by Omar ez-Zahir, and it emerged into prominence, prosperity and virtual independence under his successor "Ahmad el-Jazzar" ("the butcher"). Supported by a British fleet under Sir Sidney Smith it resisted Napoleon successfully in 1799. The year 1832 saw its capture and wreck by Ibrahim Pasha of Egypt. On Nov. 4, 1840, the city was attacked by the allied fleets (British, Austrian, Turkish) under Sir Charles Napier and after three hours' bombardment reduced. Restored in the following year to Turkey it remained in Turkish hands till Sept. 23, 1918, when it was occupied by the 13th Cavalry brigade (5th Cavalry division) of the Egyptian Expeditionary force with little or no opposition.

**Modern.**—Acre with a population (est. 1940) of 9,500 (8,000 Muslims) is in British mandated territory and under the administrative partition of Palestine in the northern province (Phoenicia and Galilee). Under Turkish rule it was the chief town of a governmental district. Formerly the chief port of shipment for grain brought on camel-back from the Hauran, its trade was much diminished with the opening of the Damascus-Beirut railway in 1896 and practically extinguished when the Haifa-Damascus railway in 1906 diverted what remained to Haifa. It has now a small coasting trade in locally grown grain, sesame seed and oil and a small export of oranges to Beirut. Brass and copper ware are made to a small extent. It is now a customs sub-station to Haifa. Acre is the chief seat of Baha'i religion, an offshoot of Babism, with an estimated number of adherents at 2,000,000. The founder 'Abdu-l Baha died here in 1921 and was succeeded by his grandson Shauki Effendi, who was made life-president of the council of nine, which regulates the affairs of the community. Few buildings of interest have survived the buffetings to which the city has been repeatedly subjected. The most notable, perhaps, is the large mosque built by el-Jazzar. Four commodious khans recall the times when 2,000 to 3,000 camels, grain laden, would arrive in a day. British administration has been responsible for the establishment of a government hospital, a forest nursery, and a large convict prison. A railway from Beirut along the coast to Acre was built in 1942.

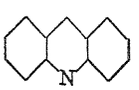
**Battle of Acre.**—The battle of 1189, fought on the ground to the east of Acre, affords a good example of battles of the Crusades. Saladin's victory at Tiberias in 1187 had led to the fall of Jerusalem and to that of almost all the Christian strongholds in Palestine and Syria, save Tyre, Antioch, and Tripoli. The attempt to regain Acre led to the battle described below and was in turn a prelude to the Third Crusade under Richard I. of England and Philip of France. The crusading army under Guy de Lusignan, king of Jerusalem, which was besieging Acre, gave battle on Oct. 4, 1189, to the relieving army raised by Saladin. The Saracens lay in a semicircle east of the town, facing inwards towards Acre. The Christians opposed them with crossbowmen in first line and the heavy cavalry in second. At Arsuf (*q.v.*) the Christians fought coherently; here the battle began with a disjointed combat between the Templars and Saladin's right wing. The crusaders were so far successful that the enemy had to send up reinforcements from other parts of the field. Thus the steady advance of the Christian centre against Saladin's own corps, in which the crossbows prepared the way for the charge of the men-at-arms, met with no great resistance. But the victors scattered to plunder. Saladin rallied his men and, when the Christians began to retire with their booty, let loose his light horse upon them. No connected resistance was offered, and the Turks slaughtered the fugitives until checked by the fresh troops of the Christian right wing. Into this fight Guy's reserve, charged with holding back the Saracens in Acre, was also drawn, and, thus freed, 5,000 men sallied out from the town to the northward; uniting with the Saracen right wing, they fell upon the Templars, who suffered severely in their retreat. In the end the crusaders repulsed the relieving army, but only at the cost of 7,000 men.

*See* Oman., *Hist. of the Art of War in the Middle Ages*, vol. 1. 333–340 (1924).

**ACRÉ** or **AQUIRY**, a river of Brazil and principal tributary of the Purús, rising on the Bolivian frontier and flowing easterly and northerly to a junction with the Purús at 8° 45′ S. The name is also applied to a district situated on the same river and on the former (1867) boundary line between Bolivia and Brazil. The region, which abounds in valuable rubber forests, was settled by Bolivians between 1870 and 1878, but was invaded by Brazilian rubber collectors during the next decade and became tributary to the rubber markets of Manáos and Pará. In 1899 the Bolivian Government established a customhouse at Puerto Alonso, on the Acré river, for the collection of export duties on rubber, which precipitated a conflict with the Brazilian settlers and finally brought about a boundary dispute between the two republics. In July 1899, the Acréanos declared their independence and set up a republic of their own, but in the following March they were reduced to submission by Brazil. Various disorders followed until Brazil decided to occupy Puerto Alonso with a military force. The boundary dispute was finally settled at Petropolis on Nov. 13, 1903, through the purchase by Brazil of the rubber-producing territory south to about the 11th parallel, estimated at more than 60,000 sq.m.

**ACRE**, a land measure used by English-speaking races. Derived from the O.E. *acer* and cognate with the Lat. *ager*, Gr. *ἀγρός*, Sans. *ajras*, it has retained its original meaning "open country," in such phrases as "God's acre," a churchyard, or "broad acres," etc. As a measure of land, it was first defined as the amount a yoke of oxen could plow in a day; statutory values were enacted in England by acts of Edward I. and III., Henry VIII., George IV.; the Weights and Measures Act 1878 defines it as 4,840sq.yds. This is the American acre. In addition to this

statute, or imperial, acre, other acres are still, though rarely, used in Scotland, Ireland, Wales and certain English counties. The Scottish acre contains 6,150 4 sq.yd.; the Irish acre 7,840 sq.yd.; in Wales, the land measures *erw* (4,320 sq.yd.), *stang* (3,240 sq yd ) and *paladr* are called acres.

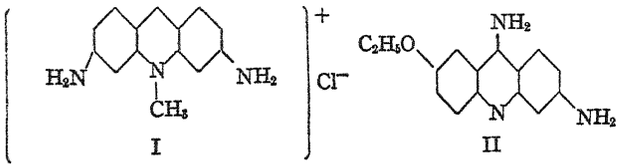


The Leicestershire acre (2,308¾ sq.yd ), Westmorland acre (6,760 sq yd ) and Cheshire acre (10,240 sq yd.) are examples of local values

**ACRIDINE** is a solid, crystallizing in needles of melting point 110° C., found in coal-tar anthracene. It is characterized by its irritating action on the skin, and by the blue fluorescence shown by solutions of its salts.

Acridine is extracted from the crude anthracene by dilute sulphuric acid, the sulphuric acid solution is treated with potassium dichromate, and the precipitate of sparingly soluble acridine dichromate is decomposed with ammonia (C. Graebe and H. Caro, *Ann.* [1871]).

Acridine and its homologues are stable compounds of feebly basic character, belonging to the general class of heterocyclic ring compounds (*see* CHEMISTRY: *Organic Chemistry*). They combine readily with the alkyl iodides to form alkylacridinium iodides, which are readily transformed by the action of alkaline potassium ferricyanide to N-alkylacridones.



Acridine itself has the structural formula

It owes its basic properties to the presence of the tertiary nitrogen atom; it may be regarded as consisting of two benzene nuclei fused to a pyridine nucleus, and shows characteristics both of the former (homocyclic) and the latter (heterocyclic) structure

Phenylacridine is the parent base of chrysaniline, the chief constituent of the dyestuff phosphine (a by-product in the manufacture of rosaniline). The dyestuff phosphine must be distinguished from the phosphorus hydride of the same name, and from the organic derivatives of this substance, to which the general term phosphine is also given. Chrysaniline (diamino-phenylacridine) forms red salts, dyeing silk and wool a fine yellow; the solutions of the salts are characterized by their fine yellowish-green fluorescence.

Several acridine derivatives and notably acriflavine (*syn.* trypaflavine, euflavine) found extensive use during World War I as antiseptics for infected wounds (C. H. Browning and others). The preparation of acriflavine (I) and of proflavine, another acridine antiseptic of similar type was described by L. Benda (1912).

I II

Rivanol (II) also of the acridine series was recommended by J. Morgenroth (1921) as a powerful tissue antiseptic against spreading infection caused by streptococcus.

The antimalarial quinacrine (atabrine) is an acridine derivative.

**ACRIFLAVINE,** an acridine derivative obtained from coal tar, is a reddish-brown powder with antiseptic properties. Introduced as an antiseptic in 1912 by Paul Ehrlich as trypaflavine, it was used extensively in World War I but later was largely replaced by such chemotherapeutic agents as the sulfonamides and antibiotics.

In solutions it is used as the hydrochloride or as the less irritating base, neutral acriflavine, for irrigating wounds and for the treatment of gonorrhoea. As a urinary antiseptic, it may be taken by mouth. (F. L. A.)

**ACRO, or ACRON, HELENIUS,** Roman grammarian, probably flourished at the end of the 2nd century A.D. He wrote commentaries on Terence and perhaps Persius. A collection of scholia on Horace was wrongly attributed to him.

*See* O. Keller (ed.), *Pseudoacronis Scholia in Horatium Vetustiora.*

**ACROLITHS,** statues of a transition period in the history of plastic art, in which the trunk of the figure was of wood, and the head, hands and feet of marble. The wood was concealed either by gilding or, more commonly, by drapery, and the marble parts alone were exposed.

**ACROMEGALY,** a condition characterized by an enlargement of both bony and soft parts of the hands, feet and face. It occurs in adults and is due to an oversecretion of the growth hormone of the anterior lobe of the pituitary gland.

A similar overactivity in childhood and early adolescence gives rise to giantism. (*See* ENDOCRINOLOGY.) (F. L. A.)

**ACRON,** a Greek physician of the 5th century B.C., born at Agrigentum in Sicily, was contemporary with Empedocles. The method of lighting large fires and purifying the air with perfumes, to put a stop to the plague in Athens (430 B.C.), is said to have originated with him.

**ACROPOLIS,** literally the upper part of a town (Gr. ἄκρος "top," πόλις, "city").

For purposes of defense early settlers chose elevated ground, frequently a hill with precipitous sides, and these early citadels became in many parts of the world the nuclei of large cities which grew up on the surrounding lower ground. The word acropolis, though associated primarily with Greek towns (Athens, Argos, Thebes, Corinth), is applied to all such citadels. The most famous is that of Athens, which, by reason of its historical associations and the famous buildings erected upon it, is generally known as *the* Acropolis (*see* ATHENS).

**ACROPOLITA (AKROPOLITES), GEORGE** (1217–1282), Byzantine historian and statesman, was born at Constantinople. At an early age he was sent to the court of John Ducas Batatzes (Vatatzes), emperor of Nicaea, by whom and by his successors (Theodorus II Lascaris and Michael VIII Palaeologus) he was entrusted with important state missions. The office of "great logothete," or chancellor, was bestowed upon him in 1244.

Acropolita's most important political task was that of effecting a reconciliation between the Greek and Latin Churches. In 1273 he was sent to Pope Gregory X, and at the Council of Lyons (1274) in the emperor's name he recognized the spiritual supremacy of Rome.

In 1282 he was sent on an embassy to John II, emperor of Trebizond, and died in the same year.

His historical work (Χρονικὴ Συγγραφή, *Annales*) embraces the period from the capture of Constantinople by the Latins (1204) to its recovery by Michael Palaeologus (1261), thus forming a continuation of the work of Nicetas Acominatus. It is valuable as written by a contemporary, whose official position gave him access to trustworthy information.

He wrote several shorter works, among them being a funeral oration on John Batatzes, an epitaph on his wife Eirene and a panegyric of Theodorus II Lascaris of Nicaea. While a prisoner at Epirus, he wrote two treatises on the procession of the Holy Ghost.

Bekker (1836), and Migne, *Patrologia Graeca,* cxl; in the Teubner series by A. Heisenberg (1903), vol. ii of which contains a full life, with bibliography; *see* also C. Krumbacher, *Geschichte der byzantinischen Litteratur* (1897).

**ACROSTIC,** a short verse composition, so constructed that the initial letters of the lines, taken consecutively, form words (Gr. ἄκρος, "at the end," and στίχος, "line" or "verse"). The fancy for writing acrostics is of great antiquity, having been common among the Greeks of the Alexandrine period, as well as with the Latin writers since Ennius and Plautus, many of the arguments of whose plays were written with acrostics on their respective titles. One of the most remarkable acrostics was contained in the verses cited by Lactantius and Eusebius in the 4th century, and attributed to the Erythraean sibyl, the initial letters of which form the words Ἰησοῦς Χριστὸς Θεοῦ υἱὸς σωτῆρ, "Jesus Christ, the son of

God, the Saviour." The initials of the shorter form of this again make up the word Ἰχθύς (fish), to which a mystical meaning has been attached (Augustine, *De Civitate Dei,* 18, 23), thus constituting another kind of acrostic.

Acrostic verses have always been held in slight estimation from a literary standpoint. Dr. Samuel Butler says, in his "Character of a Small Poet," "He uses to lay the outside of his verses even, like a bricklayer, by a line of rhyme and acrostic, and fill the middle with rubbish." Addison (*Spectator,* No 60) found it impossible to decide whether the inventor of the anagram or the acrostic were the greater blockhead; and, in describing the latter, says, "I have seen some of them where the verses have not only been edged by a name at each extremity, but have the same name running down like a seam through the middle of the poem." And Dryden, in *Mac Flecknoe,* scornfully assigned Shadwell the rule of

Some peaceful province in acrostic land.

FROM BUHLMANN, "CLASSIC AND RENAISSANCE ARCHITECTURE," NEFF AND HELBURN

TWO GREEK ACROTERIA Top and lower right, front and back of apex type. (From Fletcher, "Hist. of Arch.," Batsford.) Lower left, eaves type

The name acrostic is also applied to alphabetical or "abecedarian" verses. Of these we have instances in the Hebrew psalms (*e.g.,* Ps. xxv and xxxiv), where successive verses begin with the letters of the alphabet in their order. The structure of Ps. cxix. is still more elaborate, each of the verses of each of the 22 parts commencing with the letter which stands at the head of the part in our English translation.

At one period much religious verse was written in a form imitative of this alphabetical method, possibly as an aid to the memory. The term acrostic is also applied to the formation of words, from the initial letters of other words. Ἰχθύς, referred to above, is an illustration of this. So also is the word "Cabal," which, though it was in use before, with a similar meaning, has, from the time of Charles II., been associated with a particular ministry, from the accident of its being composed of Clifford, Ashley, Buckingham, Arlington, and Lauderdale.

*Double acrostics* are such as are so constructed, that not only initial letters of the lines, but also the middle or last letters, form words. For example:—1. By Apollo was my first made. 2. A shoemaker's tool. 3. An Italian patriot. 4. A tropical fruit. The initials and finals, read downwards, give the name of a writer and his *nom de plume.* Answer *Lamb, Elia*

1. L yr E
2. A w L
3. M azzin I
4. B anan A

A curious and clever 20th-century development of the acrostic is the quadruple acrostic. The following, taken from R. A. Knox's *Book of Acrostics,* is a good example.

Uprights: Since there's no A, B, let us C and D.

Lights: 1. Reverse the name a schoolboy might apply, for briefness, to his weekly subsidy.
2. A lady thus (but with an S)
   In Southern lands you might address.
3. Initials seen on many a truck.
4. To cattle breeders brings bad luck.

SOLUTION

Uprights: "Since there's no help, come, let us kiss and part."
Lights: 1. HsaCteKcoP (Reverse of Pocket Cash).
2. (s) En Or It A
3. L M.S R.
4. P E S T

Acrostics may be very simple and also very intricate. The modern acrostic seems to hit the happy medium and, whilst giving the reader plenty of food for thought, sends him occasionally to his Cruden, his classical dictionary or his encyclopaedia

BIBLIOGRAPHY.—P. M. Pearson, *Acrostic Dictionary* (1901); R. A. Knox, *Book of Acrostics* (1924); L. C. Scott, *Acrostic Poems* (Iowa, 1924).

**ACROTERIUM** or AKROTERION, in architecture, a statue or ornament of any kind placed on the apex or at the lower angles of a pediment. The word is sometimes restricted to the pedestal supporting such an ornament.

**ACT,** a word varying in significance according to the sense in which it is employed. It is often synonymous with "statute" (*see* ACT OF PARLIAMENT). It may also refer to the result of the vote or deliberation of any legislature, the decision of a court of justice or magistrate, in which sense records, decrees, sentences, reports, certificates, etc., are called *acts.* In law act means any instrument in writing, which declares or proves the truth of a bargain or transaction, as: "I deliver this as my act and deed" The origin of the legal use of the word "act" is in the *acta* of the Roman magistrates or people, of their courts of law, or of the senate, meaning (1) what was done before the magistrates, the people or the senate; (2) the records of such public proceedings. In the sense of "document" it is used in those systems of law which are derived from the Roman.

**ACTA DIURNA,** called also *Acta Populi, Acta Publica* and simply *Acta* or *Diurna,* in imperial Rome a sort of daily gazette, containing an official narrative of noteworthy events at Rome. Its contents were partly official (court news, decrees, etc), partly private (notices of births, etc.). Thus to some extent it filled the place of the modern newspaper (*q.v.*). The *Acta* were originated by Julius Caesar, who ordered the keeping and publishing of the acts of the people by public officers. The *Acta* were exposed daily in a public place on a whitened board (*see* ALBUM). After remaining there for a reasonable time they were taken down and preserved with other public documents, so that they might be available for reference.

AFTER A CAST IN METROPOLITAN MUSEUM OF ART

ACTAEON, MYTHICAL HERO AND HUNTER, KILLED BY HIS HOUNDS FOR HAVING ACCIDENTALLY SEEN DIANA (ARTEMIS) WHILE BATHING

The *Acta* differed from the Annals (discontinued in 133 B.C.) in that only the more important matters were given in the latter, while in the former things of less note were recorded. Their publication continued till the transference of the seat of the empire to Constantinople.

*See* Gaston Boissier, *Tacitus and other Roman Studies* (Eng. trans. W. G. Hutchison, 1906), p. 197–229.

**ACTAEON,** son of Aristaeus and Autonoë, Boeotian hero and hunter. According to Ovid (*Metam.,* iii. 131), having accidentally seen Artemis on Mt. Cithaeron while she was bathing, he was changed by her into a stag, and pursued and killed by his 50 hounds. His statue was often set up on rocks and mountains as a protection against excessive heat, and the myth itself probably represents the destruction of vegetation during the 50 dog-days. Aeschylus and other tragic poets and artists made use of the story, which is illustrated by a noted small marble group in the British Museum.

**ACTA SANCTORUM,** a collection of the lives of the saints, arranged day by day according to the calendar, and compiled by the Bollandists, Belgian Jesuits. The work, first conceived at the commencement of the 17th century, has been carried on ever since, save during the period of the suppression of the Society of Jesus in Belgium. In 1925 the fourth volume for November, dealing with the days Nov. 9 and Nov. 10, was published. (*See* BOLLANDISTS)

**ACTA SENATUS** or **COMMENTARII SENATUS,** minutes of the discussions of the Roman senate. Before the first consulship of Julius Caesar (59 B.C.), minutes of the proceedings of the senate were occasionally published, unofficially; Caesar, however, ordered them to be issued authoritatively. The keeping

of them was continued by Augustus, but their publication was forbidden A young senator was chosen to draw up these Acta, which were kept in the imperial archives and public libraries Special permission from the city praefect was necessary in order to examine them. (*See* ACTA DIURNA.)

**ACTING.** Greek drama is usually given first consideration in connection with the origin of dramatic art, but the basic reasons for imitation, mimicry and what is now called "acting" are found in the study of the lower races of man. Make-believe, or the desire to imitate, is, perhaps, most common among children the world over, and it appears also among many animals.

Loomis Havemeyer points out (*The Drama of Savage Peoples*) that "there is a twofold purpose in this imitation characteristic of savage peoples. The first and simplest is that it gives a pleasurable sensation similar to the real experience. And, secondly, it enables man to convey his impressions to others—*i.e*, it is a form of language" From the last purpose grew the gesture, or any bodily gesticulation or facial expression that serves as an aid to, or a substitute for, the spoken language of the savage. It was a common means of communication.

**Development.**—The evolution of acting, from its simple beginnings to modern times, is summed up by Brander Matthews (*The Development of the Drama*) "The dramaturgic faculty is evolved slowly with the growth of civilization; and play-making skill is one of the latest of human accomplishments. But the rudimentary is everywhere visible, even among the most primitive peoples. As we consider the history of human progress, we perceive that the drama is almost the very earliest of the arts, as early, perhaps, as the art of personal adornment; and we discover also that it is the very latest to attain its complete expression. But in the noblest work of the Greek dramatists, and in the most powerful plays of the Elizabethans, the same principles are applied which we discover, doubtlessly, in the rudest theatrical attempts of the lowest savages. It is out of the crude efforts, such as still may be observed among the Eskimo and the tribes of the Amazon, that the dramatic art was toilfully developed by our own predecessors as taste refined and civilization advanced. The traditions of these rude play-makers were passed down from generation to generation, and the art slowly discovered itself."

**Grecian Influences.**—It was not until the gods of Egypt were accepted by the Greeks that there appears any ceremony which can be truly called dramatic. The Greek drama arose through the worship of the gods of vegetation, and later developed into the form of the plays of the great dramatists. It is difficult, however, to think of the drama of the Greeks without thinking of its close connection with the dance. The myth was the subject matter; the dance was the expression of that subject matter, be it the idea of spring, the awakening of new life, or the representation of various objects such as trees and events by means of gestures, postures and attitudes. In the early religious history of Greece all the people took a part in the dramatic dances around the altar, but later, a certain few of the most capable actors were selected from the chorus to play outstanding *rôles,* or to play many, and sometimes all, of the parts in the play—inasmuch as the custom of wearing masks made this possible. The number of principal actors in a Greek play seldom exceeded three, and it was more common to have only one character appear at a time. Thus it was that acting became a profession, and, among the Greeks, a very noble one. The profession was confined entirely to men.

**Italian Interests.**—In Italy the dramatic instinct has been very pronounced among its people as far back as records show. The dramatic literature of Italy has emerged from centuries of political and religious strife, but through all these troubled days the genius of the Italian people has led it to love the drama, and more—the art of acting. Before the writing of plays, and even after, as in the *Commedia dell'arte,* it has not been uncommon for a group of people to dramatize impromptu. Given a theme on which to bring out some feeling or desire, they express this spontaneously in the form of a play. The love of music, dance and spectacle did more, perhaps, to preserve this interest in the dramatic art through the political and religious struggles—the periods that provided no dramatic literature—than any other influence.

**The Elizabethan Drama.**—The art of acting was emphasized more by Shakespeare than by any other dramatist of his day His plays show a remarkable interest in characterization, in which he brought forth every known type of humanity that would fit into the tragic or comic *rôles* that he created. It should be noted that between 1810 and 1835, a period described by William Archer as "the winter solstice of English drama," English acting reached its highest peak in the genius of Edmund Kean. For his greatness we have the testimony of the masterly criticism of William Hazlitt and Leigh Hunt. Yet it is doubtful that, without the strong emphasis on Shakespearean production at the time, Kean or his fellows would have so flourished. Shakespeare's own convictions as to the importance of acting, shown in Hamlet's speech to his players, cannot be overestimated, for here he incorporates the fundamentals of good acting, the important factors in the better use of the voice and body:

"Speak the speech, I pray you, as I pronounced it to you, trippingly on the tongue; but if you mouth it, as many of your players do, I had as lief the town-crier spoke my lines. Nor do not saw the air too much with your hands, thus; but use all gently; for in the very torrent, tempest, and, as I may say, whirlwind of your passion, you must acquire and beget a temperance that may give it smoothness. Oh, it offends me to the soul to hear a robustious, periwig-pated fellow tear a passion to tatters to very rags, to split the ears of the groundlings who, for the most part, are capable of nothing but inexplicable dumb-show and noise; I would have such a fellow whipped for o'erdoing Termagant; it out-Herods Herod, pray you, avoid it."

"Be not too tame, neither, but let your own discretion be your tutor; suit the action to the word, the word to the action . . ."

**Views of Diderot.**—It was not until about the 18th century that the different theories, or definite systems, of acting began to appear to any extent. Denis Diderot, the French encyclopaedist, grew weary of the classical French drama, with its conventional acting, and advanced as its opposite the theory of a drama of real life, which was, among other things, to be a truer reflection of the bourgeois of France. Diderot said (*Paradoxe sur le comédien*) that "The possibilities of a good actor lie in the complete absence of sensibility," and recommended to the actor that he should watch himself during the performance, that he should listen to his voice and give only "recollections of his emotions."

Theodore Komisarjevsky, formerly producer and art director of the Moscow State and Imperial theatre, wrote of this theory: "It is proved now that an actor cannot move the audience, or be in any way creative on the stage, if he watches himself acting. Instead of being concentrated on the images he has to create, on his inner self, he becomes concentrated on his outer self, becomes self-conscious and loses the power of imagination. The better way is to act only with the help of the imagination; to create, and not to imitate or reproduce one's own life experiences. When the actor playing a part is living in a world of images created by his own phantasy, he cannot and need not watch and control himself. The images created by the actor's phantasy, and obedient to his call, control, guide and direct his emotions and actions during the performance."

## MODERN TENDENCIES

The 20th century has seen several new and distinct theories of acting. Different schools, academies of acting and theatres, mostly repertory, have done a great deal towards improving the standard of acting and team work or ensemble acting, on the stage: notably, in England, the Repertory theatre in Birmingham and the Liverpool Repertory theatre; in Ireland the Abbey theatre, Dublin. Such English producers as Gordon Craig, Granville Barker, Basil Dean, J. B. Fagan, Lewis Casson, Nigel Playfair, performed very important work in improving the quality of acting, and creating stage ensembles, not only directly by their stage work, but also by their writings on the subject. In the United States, David Belasco, the Theatre Guild of New York,

the Washington Square Players, the Provincetown Playhouse and such producers as Arthur Hopkins, R. E Jones, the Reichzts and others contributed to this improvement Moreover, the Little Theatre movement (*q.v.*) in the U S must not be overlooked.

Producers such as Max Reinhardt in Germany and Firmin Gémier in Paris used, for the most part, the methods of acting created by the naturalists, André Antoine in France, and Kroneg, the producer of the German Meininger company, and developed by Otto Brahm in Berlin and by Stanislavsky in Moscow Sometimes these producers introduced, in this naturalistic acting, ideas of the formalists, Georg Fuchs in Germany, Vsevolod Meyerhold and Alexander Tairof in Russia, Gordon Craig in England and others. Sometimes they introduced touches of the synthetic theories of acting advocated by Komisarjevsky after 1910. The majority of the French actors trained in the Conservatoire in Paris remained still under the influence, not only of the old romantic school, but also of the pseudo-classical school of acting of the 18th century.

**Naturalism.**—The best-known of all the new theories of acting which appeared after 1910 was the system of Stanislavsky, the leading producer and director of the Moscow Art theatre. His system was founded on the principle that an actor, having to be natural and sincere on the stage, could be so only by means of reproducing emotions experienced at some time or other in his life. That form of "psychical naturalism" became part of Stanislavsky's system as a result of "outer naturalism," which he advocated before he turned to psychology in the endeavour to find out a scientific system of acting.

The "inner naturalism" in acting was not a new feature in Stanislavsky's theory. Some French theatrical theorists had already, in the 18th century, founded their systems of acting on the same ideas. They held that an actor can represent himself on the stage only if it is desired that he should be sincere; that "love scenes are much better played by actors who are in love in real life." Like the followers of Jean Racine, Stanislavsky believed that contemporary actors living in their own time, and each one in his special atmosphere, are unable to produce other emotions than those that are applicable to the time and to the surroundings in which they lead their every-day life. To be sincere, they must place, beneath the lines and stage directions of the author, their own emotions already experienced in real life.

It is quite clear that this type of acting destroys the form created by the author of the play and the rhythm of his lines, which express the inner content and the inner movements of the play. The actor who acts by the power of his imagination passes from the form and the rhythm of the play to the inner content of it. The idealistic and emotional content of the play, which he obtains through the form and rhythm of the play, exists in his imagination, and produces the necessary working of his intellect to create a stage character with all its peculiarities. The pupil of Stanislavsky neglects the form and rhythm of the play and substitutes his own remembered, intellectual states in place of those of the author.

**The Formalists.**—Another system, opposed to Stanislavsky's ideas, was advocated by the symbolists, the formalists and the expressionists. Here we have a complete negation of sincerity and life-likeness; the less the acting is sincere and life-like the better. The actor must not try to create any definite characters; he must represent abstract ideas, and convey these through his speeches delivered in a formal way, and through his movements and gestures, again produced in a formal, unlife-like and "picturesque" or marionette-like style. The Russian and German formalists, Meyerhold, Tairof and Erwin Piscator, after the Revolution, became much interested in acrobatics and circus business; the movements of the actors in their productions became something akin to a *perpetuum mobile,* dominating both the psychology of the play and the meaning of the lines. Thus the acting on their stages resembled a mixture of circus and cubistic ballet performance. Later, Meyerhold returned to the more or less naturalistic style. Some impressionists, such as Leopold Jessner and Nicholas Evreinov, used formal methods interspersed with psychological touches. Actors on the French *avant-garde* stages worked on somewhat similar lines at the Atelier directed by Charles Dullin, in the productions of Georges Pitoef and Louis Jouvet. At the *Vieux Colombier,* they used the same methods of acting Jacques Copeau, the director of that theatre, must be considered as a pioneer, in France, in the fight against naturalism and the old-fashioned Conservatoire acting. He definitely introduced such new methods of acting as the psychological and the formal on the French stage

## ACTING IN THE ENGLISH-SPEAKING COMMERCIAL THEATRE

The English-speaking theatre after 1920 accelerated its divergence from the Russian and European theatres, and acting reflected that divergence. The public bestowed its patronage upon the new and the original The repertory system and the so-called "stock" system of revivals diminished almost to the vanishing point, although a reappearance of these systems is now happily to be seen. The theory of continuity and tradition which flourished in Europe prior to World War I relinquished any hold it had on the commercial theatre of the United States and England. Only in the case of the Shakespearean classics did the repertory idea survive, as for instance in the "Old Vic" and Stratford on-Avon companies in England; and even there the emphasis was continually placed on fresh interpretation. The U S. never had "schools" of acting within the European meaning of a company of actors drilled and trained by a director or producer who taught a "style." From Henry Irving, Edwin Booth and Richard Mansfield, through Gerald du Maurier, John Drew and the Barrymores, no claim, or even effort, was made to establish any method of acting. Ellen Terry and Ada Rehan, Maude Adams and Mrs. Patrick Campbell not only set no rigid principles for their craft, but lavished their scorn upon copyists.

The theatre today (1945) cannot even point to "typical" acting, so great has been the emphasis upon the fresh, the new, the unexpected. A "star" may be born between 8.30 and 11.00 P M of an opening night, although he may never have faced an audience before that night, so great is the public's appetite for the original. And yet that star may fade abruptly without another flicker if he cannot adapt his talents to the next play. The public is loyal to the actor, but it is noticeable that it is increasingly impatient of fads and easily tired of idiosyncrasies. It is no longer sufficient for the actor with personality and certain hallmarks of mannerism to exhibit himself, with a play as a background. The stylized actor—the actor who has too close an adherence to any manner of acting—finds that he fails to convey illusion to the audience precisely because he produces the expected. The actor who acts for a living on the English-speaking stage today does so in a theatre run by private enterprise for profit to all concerned. He must adapt his talents to the practical considerations of that theatre or he will not get a chance to do any acting. He must transmit across the footlights a clear-cut presentation of the playwright's concept and he must maintain the illusion of spontaneity for the run of the play.

Today's commercial theatre is based on the "long run." Producers, meeting the competition of the motion picture and radio, bring to each play the best obtainable elements in presentation. This is expensive, and so perforce they run the play for as long as there is patronage for it, with no regard whatsoever to the effect upon the future career of an actor. The actor, in the average successful play, must give from 200 to as many as 1,000 or more performances without interruption. He must give as valid an illusion of spontaneity at any one of these performances as on the opening night. In addition, if he desires future theatrical employment, he must also manage to maintain sufficient versatility to make him eligible for an entirely different new play. Nobody will take care of this for him but himself. How he does this in the present-day theatre, is strictly up to him. There is no formula of acting which is likely to hold good for any two plays, or for any two actors.

The actor must find his own training, because producers and directors make no effort to train him beyond a given play for which his services may be desired. Any precise method he may choose to study is his own choice and so presumably congenial

to his natural tendencies of expression In seeking employment he is under no handicap of prejudice against any particular method of training he may have selected, nor is he necessarily handicapped if he has provided himself with no training.

The director of a production is, of course, indispensable; but he has no obligation to teach an actor how to develop a characterization, nor how to sustain a performance once it is worked out In the ordinary circumstance the director's work with the actor is limited to the rehearsal and try-out period of a particular play, and his efforts with regard to the acting under his control are concerned entirely with that play. The opportunities for young actors to work under a good director in a number of varied plays, before playing on the commercial stage, are unfortunately very limited in the English-speaking theatre.

This practical circumstance of the "long run" has forced the actor to abandon any reliance on the theories of those who, like Meyerhold, Stanislavsky, Gordon Craig and others, attempted to find a scientific basis for acting. He must act the same part under any and all circumstances, personal and extraneous to him. However much he may yearn for the luxury of "use your own emotions in your acting," it is obviously physically impossible for him to do so for several hundred consecutive times. He has been forced to acquire a technical concept of his performance—a control—which will not desert him in order to assure the play consistency, and lest he blur or distort the playwright's intention by allowing the variations of his personal temporary emotions to dominate his performance. Naturally an actor, like anyone else, is much moved by a play. He reads it, reacts to it, works into it, gets fond of it, feels that he understands it. But once that reaction to a piece of writing has "crystallized" and has become part of his experience, it is an actor's job to get that understanding over to an audience according to the author's intention. It is quite possible for an actor to be impressed and moved, or depressed and disturbed, by his own performance. But unless he detaches himself from these personal [illegible] he can never acquire the discipline which gives tempo, rhythm and balance to the production as a whole.

The acting profession has come to learn that devotion to a school of acting can hamper the flexibility necessary to meet the fresh problems presented by a new play. Acting in the commercial theatre is the composite result of individualistic processes: each actor works out his own performance, bringing such resiliency of mind as he may possess to augment his accumulated experience in solving the fresh problem presented by the new characterization. If he may have acquired a knowledge of several methods of approach, so much the easier for him to make his choice of method. But no "school" or method can rule him—it is his problem, and his choice, or his invention. Good acting, like a good play, is flesh and blood and not a bundle of tricks.

Plays are written to be seen and not to be read. They must rest on the library shelf or in the producer's file cabinet unless the acting profession has the flexibility to give them visual presentation, no matter how new the form or how bizarre the requirement. The playwright is the motive force; the acting is the essential means of communication between author and audience, and not an end in itself, as in the outmoded "vehicle" play. It matters little whether acting be termed a "creative" or an "interpretive" ingredient of the theatre It is likely to be a skillful fusion of both. The balance will be one way or the other, depending on what a given play requires of the actor. Each acting part presents a unique problem for which the actor must be prepared, and to overcome which he must find himself unconfined by any theory. For instance, given an author of technical capacity, whose dramatic thesis is clearly developed, whose character structure has clarity, the acting is a matter of honest interpretation. Thus would the play be presented to the public as the playwright intended. But it is not usually so easy. Gaps left by the author, intentionally or unintentionally, must be filled in by the actor. An underwritten character can come to life on the stage because an actor is sufficiently flexible, not only to interpret, but to add his own creation.

The working out of the finished product which is today's commercial "theatre," has no rule of thumb for anything connected therewith, least of all for the acting Shakespeare, as usual, said it first To the actors, Hamlet says, "Let your discretion be your tutor" Each new play presents new problems to the actor, new decisions as to interpretation or creation How these problems are solved, what considerations prevailed, how dramatic balance was attained to the satisfaction of author, producer, director and actor, and maintained for a long run, is something which no one on the outside of any given production can know. Nor will study of any number of productions furnish a sound basis for generalization on "acting." The fundamental of good acting is the sustained illusion of originality and [illegible] actor who survives in his profession has built up, bit by bit, out of experience and temperament unique to him, his own means of sustaining that illusion. *See* also THEATRE *Direction and Acting; The Actor.*

**ACTINIC RAYS,** ultra-violet rays which produce chemical changes. The term is sometimes popularly applied to the ultra-violet rays which are invisible, but can be detected by their action on a photographic plate and by rendering certain substances fluorescent (*see* FLUORESCENCE AND PHOSPHORESCENCE). They are, to a certain extent, absorbed by the atmosphere, and, in moderate doses, have a beneficial effect on man. (*See* SPECTROSCOPY; LIGHT AND RADIATION IN RELATION TO HEALTH.)

**ACTINIDIACEAE,** a family of dicotyledonous plants, segregated from the Dilleniaceae. But four genera are recognized, the larger ones being *Actinidia,* scandent shrubs, with about 25 species, chiefly Asiatic, a few now cultivated in Europe and in the United States, the allied *Clematoclethra,* 12 species, also Asiatic, and the very large pantropic genus *Saurauia* with more than 300 species, all shrubs or small trees, characteristic of the tropics of both hemispheres. *See* E. Gilg and E Wedermann, in Engler. *A. Nat. Pflanzenfam.* ed. 2, 21:36–47. f. 26–29 (1925).

**ACTINIUM.** The metallic element actinium has the symbol Ac, atomic number 89, atomic weight 227, is exclusively trivalent, and is radioactive, the fourth member of the natural, 4n + 3 radioactive family. It occurs in uranium ores and can be manufactured from radium by transmutation in nuclear chain reactors (*see* RADIOACTIVITY, NATURAL). (G. T. SG.)

**ACTINOMETER,** an instrument for measuring the heating and chemical effects of light. It is derived from the Greek, ἀκτίς ray, μέτρον measure. The name was first given by Sir John Herschel to an apparatus for measuring the heating effect of solar rays; Herschel's instrument has been discarded in favour of the pyrheliometer (Gr. πῦρ fire, ἥλιος sun). (*See* RADIATION, RAYS.)

The word actinometer is usually applied to instruments for measuring the *actinic* or chemical effect of luminous rays; their action generally depends upon photochemical changes. A type of actinometer is used in photography under the name of exposure-meter. In this instrument a section of sensitized bromide is exposed for a measured period of time. Certain practical forms are described in the article PHOTOGRAPHY.

**ACTINOMYCOSIS** (STREPTOTRICHOSIS), a chronic infective disease occurring in both cattle and man. In both these groups it presents the same clinical course, being characterized by chronic inflammation with the formation of granulomatous tumours, which tend to undergo suppuration, fibrosis or calcification. It used to be believed that this disease was caused by a single vegetable parasite, the ray fungus, but there is now an overwhelming mass of observations to show that the clinical features may be produced by a number of different species of parasites, for which the generic name Streptothrix is adopted.

**Pathological Anatomy.**—The naked-eye appearance of the different organs affected by Streptothrix infection varies according to the duration and acuteness of the disease. In some tissues the appearance is that of a simple inflammation, whereas in others

it may be characteristic. The liver when affected shows scattered foci of suppuration, which may become aggregated into spheroidal masses, surrounded by a zone of inflammation. In the lungs the changes may be any that are produced by the following conditions: (1) An acute bronchitis. (2) A phthisical lung, grey nodules being scattered here and there almost exactly simulating tuberculous nodules. (3) An acute broncho-pneumonia with some interstitial fibrosis, and a tendency to abscess formation. The most characteristic lesions are in the skin.

The disease is more common in males than in females, and more prevalent in Germany and Russia than in England. The infection is probably spread by grain (corn or barley), on which the fungus may often be found. In a great number of recorded cases the patient has been following agricultural pursuits. The disease can only be transmitted from one individual to another with considerable difficulty, and no case of direct transmission from animal to man has yet been noted.

**Clinical History.**—The course of actinomycosis is usually a chronic one, but occasionally the fungus gets into the blood, when the course is that of an acute infective disease or even pyaemia. The symptoms are entirely dependent on the organ attacked, and are in no way specially characteristic. During life a diagnosis of phthisis is continually made, and only a microscopic examination after death renders the true nature of the disease apparent. The nature of the skin lesion is the most evident, and here the parasite may be detected early in the illness. The only drug which appears to have any beneficial influence on the course of the disease is potassium iodide, and this has occasionally been used with great benefit. Surgical interference is usually needed.

**ACTINOTHERAPY:** *see* LIGHT AND RADIATION IN RELATION TO HEALTH.

**ACTION:** *see* PRACTICE AND PROCEDURE.

**ACTIUM** (mod. PUNTA), the ancient name of a promontory in the north of Acarnania (Greece) at the mouth of the Sinus Ambracius (Gulf of Arta) opposite Nicopolis, built by Augustus on the north side of the strait.

On the promontory was an ancient temple of Apollo Actius, which was enlarged by Augustus, who also, in memory of the battle, instituted or renewed the quinquennial games called *Actia* or *Ludi Actiaci*. Actiaca Aera was a computation of time from the battle of Actium.

There was on the promontory a small town, or rather village, also called Actium.

**History.**—Actium belonged originally to the Corinthian colonists of Anactorium, who probably founded the worship of Apollo Actius and the *Actia*. In the 3rd century it fell to the Acarnanians, who subsequently held their synods there. Actium is chiefly famous as the site of Octavian's decisive victory over Mark Antony (Sept. 2, 31 B.C.). This battle ended a long series of ineffectual operations. The final conflict was provoked by Antony, who is said to have been persuaded by Cleopatra to retire to Egypt and give battle to mask his retreat; but lack of provisions and the growing demoralization of his army would sufficiently account for his decision. The fleets met outside the gulf, each over 200 strong (the totals given by ancient authorities are very conflicting). Antony's heavy fighting craft endeavoured to close and crush the enemy with their artillery; Octavian's light and mobile craft made skilful use of skirmishing tactics. During the engagement Cleopatra suddenly withdrew her squadron and Antony slipped away behind her. His flight escaped notice, and the conflict remained undecided until Antony's fleet was set on fire and thus annihilated.

**ACTIVISM** denotes any view that lays stress on action and its requirements. In psychology it means the view that stresses the importance of conation rather than cognition (*see* ATTENTION; CONATION; PSYCHOLOGY). In philosophy it denotes the view which makes utility the test of truth (*see* PRAGMATISM), or allows moral claims to justify certain theoretical assumptions (*see* KANT), or conceives of the ultimate principle of reality as some kind of will or activity (*see* ACTUALITY THEORY; SCHOPENHAUER; SPINOZA). In science it means the view which emphasizes the importance of the practical application of scientific discoveries—"knowledge is power" (*see* BACON, FRANCIS)

**ACT OF PARLIAMENT.** An act of parliament may be regarded as a declaration of the legislature, enforcing certain rules of conduct, or defining rights and conferring them upon or withholding them from certain persons or classes of persons. Acts of Parliament fall into two classes—"Public" and "Private." The former are officially defined in the Commons' Manual of Procedure as having for their object "to alter the general law," the latter, "to alter the law relating to some particular locality, or to confer rights on or relieve from liability some particular person or body of persons." The collective body of such declarations constitutes the statutes of the realm or written law of the British nation, in the widest sense, from Anglo-Saxon times to the present day. It is not, however, till the earlier half of the 13th century that, in a more limited constitutional sense, the statute-book is generally held to open, and the parliamentary records only begin to assume distinct outlines late in the reign of Edward I. It gradually became a fixed constitutional principle that an act of parliament, to be valid, must express concurrently the will of the entire legislature. It was not, however, till the reign of Henry VI. that it became customary, as now, to introduce bills into parliament in the form of finished acts; and the enacting clause, regarded by constitutionalists as the first perfect assertion, in words, of popular right, came into general use as late as the reign of Charles II. It is thus expressed in the case of all acts other than those granting money to the Crown:—"Be it enacted by the King's most excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal and Commons in this present Parliament assembled, and by the authority of the same." In the very rare cases where bills have been enacted under the Parliament Act in opposition to the will of the Lords, the formula is varied, the words "Lords Spiritual and Temporal" being omitted, and the word "Commons" being followed by "in accordance with the provisions of the Parliament Act." Where the act is a money grant the enacting clause is prefaced by the words, "Most Gracious Sovereign, we, Your Majesty's most dutiful and loyal subjects, the Commons of the United Kingdom of Great Britain and Northern Ireland, in Parliament assembled, towards making good the supply which we have cheerfully granted to Your Majesty in this session of Parliament, have resolved to grant unto Your Majesty the sums hereinafter mentioned; and do therefore most humbly beseech Your Majesty that it may be enacted, etc." Originally the collective acts of each session formed but one statute, to which a general title was attached, and for this reason an act of parliament was up to 1892 generally cited as the chapter of a particular statute, *e.g.*, 24 and 25 Vict. c. 101. Titles were, however, prefixed to individual acts as early as 1488. Now, by the Short Titles Act 1892, it is optional to cite the most important acts to that date by their short titles, either individually or collectively. Most modern acts have borne short titles independently of the Act of 1892. (*See* PARLIAMENT; STATUTE.)

**ACT OF STATE,** a term in law which may be generically described as an act of the Crown, or of some officer whose act is ratified by the Crown, which the courts will treat as conclusive and binding on them in any litigation before them. Such a defence or plea in bar can never be raised by the Crown against the subject except in respect of the exercise of the prerogative in international relations. For a full exposition of the subject, *see* STATE, ACT OF; and STATE SUCCESSION.

**ACTON, JOHN EMERICH EDWARD DALBERG ACTON,** 1ST BARON (1834–1902), English historian, only son of Sir Richard Acton, 7th baronet, and grandson of the Neapolitan admiral, Sir J. F. E. Acton, 6th baronet (*q.v.*), was born at Naples on Jan. 10, 1834. Coming of a Roman Catholic family, young Acton was educated at Oscott till 1848, under Dr. (afterwards Cardinal) Wiseman, and then at Edinburgh, and at Munich under Döllinger, whose lifelong friend he became. He had wished to go to Cambridge, but for a Roman Catholic this was then impossible. By Döllinger he was inspired with a deep love of historical research and a profound conception of its functions as a critical instrument. He began at an early age to

collect a magnificent historical library, with the object, never in fact realized, of writing a great "History of Liberty." In politics he was always an ardent Liberal. He spent much time in the chief intellectual centres of Europe and in the United States, and numbered among his friends Montalembert, De Tocqueville, Fustel de Coulanges, Bluntschli, von Sybel and Ranke. In 1859 Sir John Acton was returned to the House of Commons for Carlow and became a devoted admirer and adherent of Mr. Gladstone; but he was practically a silent member, and his parliamentary career came to an end in 1865. Meanwhile he had become editor of the Roman Catholic monthly paper, the *Rambler,* in 1859, on J. H. Newman's retirement from the editorship; and in 1862 he merged this periodical in the *Home and Foreign Review.*

Though a sincere Roman Catholic, his whole spirit as a historian was hostile to ultramontane pretensions, and his independence of thought and liberalism of view brought him into conflict with the Roman Catholic hierarchy. As early as Aug. 1862 Cardinal Wiseman publicly censured the *Review;* and when in 1864, after Döllinger's appeal at the Munich Congress for a less hostile attitude towards historical criticism, the pope issued a declaration that the opinions of Catholic writers were subject to the authority of the Roman congregations, Acton stopped the publication of his monthly periodical. He continued, however, to contribute articles to the *North British Review.* In 1865 he married the Countess Marie, daughter of the Bavarian Count Arco-Valley, by whom he had one son and three daughters. In 1869 he was raised to the peerage by Gladstone as Baron Acton; he was an intimate friend and constant correspondent of the Liberal leader, and the two men had the very highest regard for each other. Matthew Arnold used to say that "Gladstone influences all round him but Acton; it is Acton who influences Gladstone."

In the great crisis in the Roman Catholic world in 1870, over the promulgation by Pius IX. of the dogma of papal infallibility, Lord Acton was in complete sympathy on this subject with Döllinger (*q v*). Acton did not personally join the Old Catholic seceders. In 1874, when Gladstone published his pamphlet on *The Vatican Decrees,* Lord Acton wrote during Nov. and Dec. a series of letters to *The Times,* illustrating Gladstone's main theme by numerous historical examples of papal inconsistency, but demurring nevertheless to Gladstone's conclusion. In spite of his reservations, he regarded "communion with Rome as dearer than life." Thenceforth he devoted himself to persistent reading and study, combined with social life. Little indeed came from his pen, his only notable publication being a masterly essay in the *Quarterly Review* of Jan. 1878 on "Democracy in Europe"; two lectures delivered at Bridgnorth in 1877 on "The History of Freedom in Antiquity" and "The History of Freedom in Christianity"—these last the only tangible portions put together by him of his long-projected "History of Liberty"—and an essay on modern German historians in the first number of the *English Historical Review,* which he helped to found (1886). After 1879 he divided his time between London, Cannes, and Tegernsee in Bavaria. Gladstone found him a valuable political adviser, and in 1892, when the Liberal Government came in, Lord Acton was made a lord-in-waiting. Finally, in 1895, on the death of Sir John Seeley, Lord Rosebery appointed him to the Regius Professorship of Modern History at Cambridge. His inaugural lecture on "The Study of History," afterwards published with notes displaying a vast erudition, made a great impression in the university, and the new professor's influence on historical study was felt in many important directions. He delivered two valuable courses of lectures, on the French Revolution and on Modern History; but it was in private that the effects of his teaching were most marked. The great *Cambridge Modern History,* though he did not live to see it, was planned under his editorship, and all who came in contact with him testified to his stimulating powers and his extraordinary range of knowledge. He died on June 19, 1902, being succeeded in the title by his son, Richard Maximilian Dalberg Acton, 2nd baron Acton.

Lord Acton left too little completed original work to rank among the great historians. But he was one of the most deeply learned men of his time, and he is remembered for his influence on others His extensive library, composed largely of books full of his own annotations, was bought immediately after his death by Andrew Carnegie and presented to John Morley, by whom it was forthwith given to the University of Cambridge.

*See* Herbert Paul's excellent Introductory Memoir to the interesting volume of *Lord Acton's Letters to Mrs. Drew* (1904), and the authorities cited there; also Dom Gasquet's *Lord Acton and his Circle* (1906) and a selection from his correspondence, ed by J. N. Figgis and R. V. Laurence, with introduction (1917 *seq*). *A Bibliography of the Works of Lord Acton,* by W. A. Shaw, was [illegible] Royal Historical Society in 1903. The *Edinburgh Review* of April 1903 contains a luminous essay; and a chapter on Acton appears in Bryce's *Studies of Contemporary Biography* (1903). Lord Acton's *Lectures on Modern History,* ed. by J. N. Figgis and R. V. Laurence, appeared in 1906; and his *History of Freedom and other Essays* and *Historical Essays and Studies* (by the same editors) in 1907.

**ACTON, SIR JOHN FRANCIS EDWARD,** BART. (1736–1811), prime minister of Naples under Ferdinand IV, was the son of Edward Acton, a physician at Besançon, and was born there in 1736, succeeding to the English title and estates in 1791, on the death of his cousin in the third degree, Sir Richard Acton of Aldenham hall, Shropshire. He served in the navy of Tuscany, and in 1775 commanded a frigate in the joint expedition of Spain and Tuscany against Algiers. In 1779 Queen Maria Carolina of Naples persuaded her brother the grand-duke Leopold of Tuscany to allow Acton to reorganize the Neapolitan navy. He became commander-in-chief of both services, minister of finance, and finally prime minister. His policy was devised in concert with the English ambassador, Sir William Hamilton, and aimed at substituting the influence of Austria and Great Britain for that of Spain, at Naples, and consequently involved open opposition to France and the French party in Italy. In Dec. 1798 he shared the flight of the king and queen. For the reign of terror which followed the downfall of the Parthenopean republic, five months later, Acton has been held responsible. In 1804 he was for a short time deprived of the reins of government at the demand of France; but he was soon restored to his former position, which he held till, in Feb. 1806, on the entry of the French into Naples, he had to flee with the royal family into Sicily. He died at Palermo on Aug. 12, 1811.

He left three children, the elder son, Sir Richard, being the father of the first Lord Acton. The second son CHARLES JANUARIUS EDWARD (1803–1847), after being educated in England and taking his degree at Magdalene college, Cambridge, in 1823, entered the Academia Ecclesiastica at Rome. He became the secretary of the congregation of the Disciplina Regolare, and auditor of the Apostolic Chamber under Gregory XVI., by whom he was made a cardinal in 1842. Cardinal Acton helped to secure the increase, in 1840, of the English vicariates-general to eight, which paved the way for the restoration of the hierarchy by Pius IX in 1850. He died on June 23, 1847.

**ACTON,** a municipal borough in Middlesex, England, suburban to London, 9 mi. W. of St. Paul's cathedral; served by the G.W. Ry., the L.M.S. Ry., and the London Passenger Transport board. Pop. (1951) 67,424. Area 3.6 sq mi. The borough, as constituted before the boundary adjustments of 1934, forms the Acton parliamentary division and returns one member. The best [illegible] for its name is from Oak-town, in reference to the extensive forest which formerly covered the locality. The land belonged from early times to the See of London, a grant being recorded in 1220. Henry III had a residence here. At the time of the Commonwealth Acton was a centre of Puritanism. Philip Nye (d. 1672) was rector; Richard Baxter, Sir Matthew Hale (Lord Chief Justice), Henry Fielding, the novelist, and John Lindley, the botanist (d. 1865), are famous names among residents here. Acton Wells, of saline waters, had considerable reputation in the 18th century. Acton was made a municipal borough in 1921.

**ACT ON PETITION,** the term for a part of the procedure in the British Probate, Divorce and Admiralty Division, now of infrequent occurrence. It was more freely used in the old Admiralty and Divorce courts before the Judicature Acts. (*See* DIVORCE.)

**ACTS OF THE APOSTLES.** This book of the Bible was originally the sequel of the Gospel of Luke. Its separation was due to a growing view of the Gospels as a unit of sacred records, to which *Acts* stood as appendix. Historically it is of unique interest and value. The Apocryphal Acts of certain apostles, witnessing to the impression produced by our *Acts*, only emphasize this. It is the one really primitive Church history, primitive in spirit as in substance; apart from it a real picture of the Apostolic age would be impossible. With it, the Pauline Epistles are of priceless historical value; without it, they would remain bafflingly fragmentary, often even misleading owing to their "occasional" nature and emphasis.

**Plan and Aim.**—All agree that *Acts* is the work of an author of high literary skill, and that he exercised careful selection in the use of his materials, in keeping with a definite purpose and plan. It is of moment, then, to discover what these were. Here it is not needful to go farther back than F. C. Baur and the Tubingen school, with its theory of sharp antitheses between Judaic and Gentile Christianity, of which they took the original apostles and Paul to be typical. Gradually this position underwent modifications, as it became realized that neither Jewish nor Gentile Christianity was a uniform genus, and that the apostolic leaders from the first stood for mutual understanding and unity. The Tubingen school put the needful question, but did not return the correct answer because, as Ritschl showed (*Altkath. Kirche,* 2nd ed., 1857), their premises were inadequate. Still the attitude created by the theory persists in much that is written about *Acts*. On the whole, however, scholars now look at the book more objectively and follow up the hints as to its aim given by the author in his opening paragraph (i. 1–11). Thus (1) his second narrative is the natural sequel to his first. As the earlier book set forth in orderly sequence (*καθεξῆς*) the providential stages by which Jesus was led, "in the power of the Spirit," to begin the establishment of the Kingdom of God, so the later sets forth its extension by means of His chosen representatives or apostles. (2) This involves emphasis on the identity of the power, Divine and not merely human, visible in the great series of facts from first to last; God's Spirit appears as active throughout. But further (3), the Divine energy in the disciples is conditioned by the continued influence and volition of their "Lord" at His Father's right hand in heaven: "Holy Spirit" (without the article), the holy power of His personality (*see* xvi. 7 "the Spirit of Jesus"), is the living link between His action and theirs (i 2, 4 *seq.*, 8, ii. 1 *seq.*, *cf.* Luke xxiv. 49). And (4) the scope of this action is nothing less than all mankind (ii. 5 *seq.*), especially within the Roman empire. (5) Finally, as we see from the parallel in Luke xxiv. 46–48, the divinely appointed method of victory is through suffering (Acts xiv. 22), as it was for Messiah himself. This explains the space devoted to the tribulations of His witnesses, and their constancy amid them. It forms part of the virtual *apologia* for the absence of that earthly prosperity in which the ancient mind was apt to look for Divine approval. Moreover the Church's foes were chiefly Jews, whose opposition our author regards as due to blindness to the wider reading of their own religion—to which the Holy Spirit had from of old been pointing (*cf.* Stephen's speech)—and to jealousy of those who, by preaching the wider Messianic Evangel, were winning the Gentiles, and particularly proselytes, in such numbers.

These, then, seem to be the author's main *motifs:*—the *universality of the Gospel,* the *jealousy of national Judaism,* and the *Divine initiative,* manifest particularly in the gradual stages by which men of Jewish birth were led in spite of their own prejudices, to recognize the Divine will in the setting aside of national restrictions, alien to the universal destiny of Messiah's Church. The practical moral is *the Divine character of the Christian religion,* as evinced by the manner of its extension in the empire, no less than by its original expression in the Founder's life and death. Thus both parts of the author's work alike tend to produce assured conviction of Christianity as of Divine origin (Luke i. 1, 4; Acts i. 1 *seq.*).

This view gives the book a practical religious aim—a *sine qua non* to any theory of an early Christian writing. In spite of all difficulties, this religion is worthy of belief, even though it mean opposition and suffering. To meet this source of doubt the author holds up the picture of earlier days, when the great Apostle of the Gentiles enjoyed protection at the hands of Roman justice. It is implied that the present distress is but a passing phase, resting on misunderstanding; for Christianity, as the true fulfilment of Israel's religion, had once been (and might again be) treated as a recognized or lawful (*licita*) religion, the more so that it had deep kinship with non-Jewish philosophic monotheism. Meantime the example of apostolic [illegible] inspire like fidelity. *Acts* is in fact an Apology for the Church as distinct from Judaism, the breach with which is accordingly traced with fulness and care.

From this standpoint *Acts* no longer seems to end abruptly Whether as exhibiting the Divine leading and aid, or as recording the normal attitude of the Roman State, the writer has reached a climax, "Paulus Romae, apex Evangelii" (Bengel). In keeping with this, verses 26–28 of chap. xxviii. are the solemn close of the work, while verses 30, 31 are an appended observation. Yet even here, by the final word of all "unmolested," the writer ends most fitly on one of his keynotes.

The full force of this is missed by those who, rightly rejecting the idea that he had in reserve enough history to furnish another work, hold that Paul was freed from the imprisonment in which *Acts* leaves him (*see* PAUL). For those, on the other hand, who see in the writer's own comment in xx. 38, uncontradicted by what follows, a broad hint that Paul never saw his Ephesian friends again, the view is open that his end was too well known to call for explicit record. Nor would such silence be disingenuous, any more than on the theory that martyrdom overtook him later. (The view that *Acts* was written before Paul's death is excluded by the date of Luke's Gospel ) To the writer Paul's death (like the horrors of Nero's Vatican Gardens in 64) was a monstrous exception to the rule of Roman policy heretofore illustrated. Not even by the Romans themselves were all Nero's acts regarded as precedents.

**Authorship.**—External evidence, which is early and widespread (*e.g.*, Irenaeus, Muratorian Canon, Tertullian, Clement), all points to Luke, Paul's companion, probably his physician (Col. iv. 14). Evidence for his authorship of the third Gospel counts also for *Acts*. This carries us back at least to the second quarter of the 2nd century (Justin, *Dial.* 103, and Marcion). Nor was Luke prominent enough as an associate of Paul for the belief to be a mere guess. If, then, the Lucan authorship is to be doubted, it must be on internal evidence. The form of the book, however, favours Luke, who was of non-Jewish birth (*see* Col. iv 12–14 with 10 *seq.*), and as a physician presumably a man of culture. The medical cast of some of its language points the same way. This argument, first worked out by Dr. W. K. Hobart, *The Medical Language of St. Luke* (Dublin, 1882), has been urged afresh in Harnack's *Luke the Physician* (1907), to which reference may be made for all matters connected with Lucan authorship. The early tradition that this Luke was born in the Syrian Antioch suits the way in which the origin of the Antiochene Church and its place in the extension of the Gospel are described (*see* LUKE). Again, the attitude of *Acts* towards the Roman empire is just what would be expected from a comrade of Paul, but hardly from a man who belonged to the next generation. Finally, the book itself seems to claim to be by a companion of Paul. In chap. xvi. 10 without any previous warning it passes from the third person to the first. "But when he saw the vision, straightway *we* sought to go forth into Macedonia." Thenceforth "we" reemerges at certain points in the narrative until Rome is reached. These parts at least are generally held to imply the narrative of an eye-witness. If so, this eye-witness was probably also the author of the work; for the style of the "we" passages is the same as that of the book as a whole (*see* Sir J. C. Hawkins in *Horae Synopticae,* 1899, pp. 143–147). In a word, the author of Acts was Luke, Paul's companion during most of his later ministry, and also his "counterpart," "as a Hellene who yet had personal sympathy with Jewish primitive Christianity" (Harnack, *op. cit.* p. 145; *see* also LUKE).

**Sources.**—So far from such a plan and such an author being inimical to the quest after the materials used in *Acts* one may say

that it points the way thereto, while it keeps literary analysis within scientific limits. In their light one feels that the speeches in its first part (*e g*, that of Stephen)—and indeed elsewhere, too—are not "free compositions" of our author, the outcome of dramatic idealization such as ancient historians like Thucydides or Polybius allowed themselves. The Christology, for instance, of the early Petrine speeches is such as a Gentile Christian writing c AD. 80 simply could not have imagined We are forced to assume the use of early Judaeo-Christian material, akin to that implied also in the special parts of the Third Gospel. P. Feine (*Eine vorkanonische Ueberlieferung des Lukas,* 1891) suggested that a single document explains this material in both works, as far as Acts xii. Others maintain that at any rate two sources underlie Acts i–xii, or even i.–xv. (*see* A. Harnack, *The Acts of the Apostles,* 162 *seq.* and Foakes Jackson and Kirsopp Lake, *The Beginnings of Christianity,* pt. i. vol. ii 122 *seq.*). Certainly we can discern the presence of traditions of the Jerusalem Church and of the largely Hellenistic Church of Antioch. But it remains a question whether they reached our author in written form. If he was a careful inquirer (Luke i 3), especially if he was in the habit of taking down in writing what he heard from different witnesses, this may explain the phenomena (including the alleged traces of "Aramaisms") Luke would have rare facilities for collecting Palestinian materials, varying no doubt in accuracy but all relatively primitive, whether in Antioch or in Caesarea, where he probably resided for some two years in contact with Philip the Evangelist and his daughters (xxi. 8). There and elsewhere he might also learn a good deal from John Mark, Peter's friend (I. Pet. v. 13; Acts xxi. 12).

In the second or strictly Pauline half, two main theories of the so-called "we" passages are possible: (1) that which sees in them traces of an earlier document—whether a travel-diary or a more consecutive narrative written later; and (2) that which regards the "we" as due to the author's breaking instinctively into the first person plural where he felt himself specially identified with the history. On the former hypothesis, it is still in debate whether the "we" document lies behind more of the narrative than is definitely indicated by the formula in question (*e.g.,* chaps. xiii.–xv, xxi. 19–xxvi). On the latter, the presence or absence of "we" may well be due to psychological causes, rather than to the writer's mere presence or absence. Sometimes, he may be writing as a member of Paul's mission at the critical stages of onward advance (xvi. 10 *seq.,* xx. 5 *seq.,* xxvii. 1 *seq.*); sometimes rather as a witness absorbed in his hero's words and deeds (so "we" ceases between xx. 15 and xxi. 1). In the former cases the whole "mission" was on the move.

**Historical Value.**—Questions of authorship and sources are of moment mainly as bearing on the contents as history (see *Beginnings of Christianity,* as above, pp. 265–348). *Acts* falls into two distinct parts. The first (i.–xii.) deals with the church in Jerusalem and Judaea, and with Peter as central figure—at any rate in chaps. i.–v. The difficulty here is that we have but few external means of testing the narrative (*see* further, *Date*). Some of it may have suffered partial transformation in oral tradition before reaching our author; *e.g.,* the nature of the Tongues at Pentecost does not accord with what we know of the gift of "tongues" generally. The second part pursues the history of the apostle Paul; and here we can compare it with his Epistles. The result is a general harmony, without any trace of direct use of these letters; and there are many minute coincidences. But there are also two remarkable exceptions. These are, the account given by Paul of his visits to Jerusalem in *Galatians* as compared with *Acts;* and the nature of his mission, as it appears in his letters and in *Acts.*

In regard to the first point, differences as to Paul's movements before his return to his native province of Syria-Cilicia (*see* PAUL) can be explained by the different interests of Paul and our author respectively. But what of the visits of Gal. ii. 1–10 and Acts xv.? If they refer to the same occasion, as is usually assumed, it is hard to see why Paul should omit reference to the public occasion of the visit and to the public vindication of his policy. But in fact the issues of the visits, as given in Gal. ii. 9 *seq.* and Acts xv. 20 *seq.,* are not at all the same (Harnack [*op. cit.* pp. 245 *seq*] and others vainly argue that the Abstinences defined for Gentiles were in the original text of Acts xv. 20 purely moral, and had no reference to Jewish scruples as to eating blood). Nay more, if Gal. ii. 1–10 = Acts xv, the historicity of the "Relief visit" of Acts xi. 30, xii. 25, seems excluded by Paul's narrative before the visit of Gal. ii. 1 *seq* Accordingly, Sir W. M. Ramsay and others argue that the latter visit itself coincided with the Relief visit, and see in Gal. ii. 10 witness thereto. But why, then, does not Paul refer to the *public* charitable object of his visit? It seems easier therefore to admit that the visit of Gal. ii. 1 *seq.* is one unrecorded in *Acts,* owing to its private nature as preparing the way for public developments—with which *Acts* is mainly concerned. In that case it would fall shortly before the Relief visit, to which there may be indirect explanatory allusion in Gal. ii. 10 (*see* further PAUL); and it will be shown below that such a conference of leaders in Gal. ii. 1 *seq.* leads up excellently both to the First Mission Journey and to Acts xv. (For other views *see The Beginnings of Christianity,* 273 *seq.,* 321 *seq.*)

We pass next to the Paul of *Acts.* In his epistles Paul insists that he was the apostle to the Gentiles, as Peter was to the Circumcision; and that circumcision and the observance of the Jewish law were of no importance to the Christian as such. But in *Acts* it is Peter who first opens up the way for the Gentiles. It is Peter who used the strongest language in regard to the intolerable burden of the Law as a means of salvation (xv. 10 *seq. cf* 1). Not a word is said of difference between Peter and Paul at Antioch (Gal. ii 11 *seq*). The brethren in Antioch send Paul and Barnabas up to Jerusalem to ask the opinion of the apostles and elders; they state their case, and carry back the decision to Antioch. Throughout Acts Paul never stands forth as the unbending champion of the Gentiles. He seems anxious to reconcile the Jewish Christians by personally observing the law of Moses. He circumcises the semi-Jew, Timothy; and he performs his vows in the temple. He is particularly careful in his speeches to show how deep is his respect for the law of Moses. In all this the letters of Paul are very different from *Acts.* In *Galatians* he claims perfect freedom in principle, for himself as for the Gentiles, from the obligatory observance of the Law; and neither in it nor in *Corinthians* does he take any notice of a decision reached at Jerusalem. The narrative of *Acts,* too, itself implies something other than what it sets in relief; for why should the Jews hate Paul so much, if he was not in some sense disloyal to their Law?

There is, nevertheless, no essential contradiction here, only such a difference of emphasis as belongs to the standpoints and aims of the two writers and to different historical conditions. Peter's function in relation to the Gentiles belongs to early Palestinian conditions, before Paul's distinctive mission had taken shape. Once Paul's apostolate—parallel with the more collective apostolate "the Twelve"—has proved itself by tokens of Divine approval, Peter and his colleagues frankly recognize the distinction of the two missions, and are anxious only that the two shall not fall apart by religiously and morally incompatible usages (Gal. ii. 10, *cf.* Acts xv.). Paul, on his side, clearly implies that Peter felt that the Law could not justify (Gal. ii. 15 *seq.*), and argues that it could not now be made obligatory in principle (*cf.* "a yoke," Acts xv. 10); yet for Jews it might continue for the time (pending the Parousia) to be seemly and expedient, especially for the sake of non-believing Judaism. To this he conformed his own conduct as a Jew, so far as his Gentile apostolate was not involved (I Cor. ix. 19 *seq.*). There is no reason to doubt that Peter largely agreed with him, since he acted in this spirit in Gal. ii. 11 *seq.,* until coerced by Jerusalem sentiment to draw back for expediency's sake. This incident it did not fall within the scope of *Acts* (*see* above) to narrate, since it had no abiding effect on the Church's extension. As to Paul's submission of the issue in Acts xv. to the Jerusalem conference, *Acts* does not imply that Paul would have accepted a decision in favour of the Judaizers, though he saw the value of getting a decision for his own policy in the quarter to which they were most likely to defer. If the view that he already had an understanding with the "Pillar" Apostles, as recorded in Gal. ii. 1–10 (*see* further PAUL), be correct, it gives

the best of reasons why he was ready to enter the later public Conference of Acts xv. Paul's own "free" attitude to the Law, when on Gentile soil, is just what is implied by the hostile rumours as to his conduct in Acts xxi. 21, which he was glad to disprove as at least exaggerated (*ib.* 24 and 26). What is clear is that such lack of formal accord as here exists between *Acts* and the Epistles tells against its author's dependence on the latter; and so favours his having been a comrade of Paul himself.

**Speeches.**—The speeches in *Acts* deserve special notice. Ancient historians (like many of modern times) used the liberty of working up in their own language the speeches recorded by them. They did not dream of verbal fidelity; they preferred to mould a speaker's thoughts to their own methods of presentation. Besides this, some did not hesitate, for vividness' sake, to give to their characters speeches which were never uttered. Now how far has the author of *Acts* followed these practices? Some of its speeches are evidently bare summaries. Others claim to be reports of speeches really delivered. But all have been passed through one mind, and some mutual assimilation in phraseology and idea may well have resulted They are, moreover, all of them, mere abstracts. Yet these circumstances, while inconsistent with verbal accuracy, do not destroy authenticity; and in most cases (*e.g.* xiv. 15–17) there is a varied appropriateness, as well as an allusiveness, pointing to good information (*see* under *Sources*). There is no evidence that any speech in *Acts* is the free composition of its author, without either written or oral basis, and in general he seems nearer than most ancient historians to the essentials of historical accuracy.

**Miracles.**—Objections to the trustworthiness of *Acts* on the ground of its miracles require to be stated more carefully than has usually been the case especially as bearing on authorship. For the idea of the "miraculous" or supernormal is hardly if at all, less marked in the "we" sections (where efforts to dissect it out are fruitless) than in the rest of the work. The scientific method, then, is to consider each "miracle" on its own merits, according as we may suppose that it has reached our author more or less directly. But even the form in which the gift of Tongues at Pentecost is conceived does not exclude Luke's authorship, since it may have stood in his source; and the first outpouring of the Messianic Spirit may soon have come to be thought of as unique by some Jewish Christians, parallel in form to the Rabbinic tradition as to the inauguration of the Old Covenant at Sinai (*cf.* Philo, *De decem oraculis*, 9, 11, and the Midrash on Ps. lxviii. 11).

As to such historical difficulties in *Acts* as still remain, there are various possibilities of mistake intervening between the facts and the accounts which reached its author, at second or even third hand (*see* further under *Date*). Also recent research in antiquity has tended to verify such parts of the narrative as can be tested, as Sir W. M. Ramsay in particular has shown. The proofs of trustworthiness extend also to the theological sphere. What was said of the Christology of the Petrine speeches applies to the whole conception of Messianic salvation, the eschatology, the idea of Jesus as equipped by (the) Holy Spirit for His Messianic work. These and other forms of very primitive witness in *Acts* have not indeed the value of shorthand notes or even of abstracts based thereon. But they suggest that our author gave a faithful account of such words and deeds as had come to his knowledge. The perspective of the whole is no doubt his own; and as his materials furnished but few hints for a continuous narrative, this perspective, especially in things chronological, may sometimes be faulty. Yet when one remembers that by A.D. 70–80 it must have been a matter of small interest by what *tentative* stages the Messianic salvation was first extended to the Gentiles, it is surely surprising that *Acts* enters into any detail on the subject, and is not content with a summary account such as the mere logic of the matter would naturally suggest.

"Study of Sources" (*Quellenkritik*), then, solves many difficulties in the way of treating *Acts* as an honest narrative by a companion of Paul. In addition, we may also count among recent gains a juster method of judging such a book. For among the results of the Tübingen criticism was what Dr. W. Sanday called "an unreal and artificial standard, the standard of the 19th century rather than the 1st, of Germany rather than Palestine, of the lamp and the study rather than of active life." This has a bearing, for instance, on the differences between the three accounts of Paul's conversion in *Acts*. In the recovery of a more real standard, we owe much to men like Mommsen, Ramsay, Blass and Harnack, trained amid methods and traditions other than those which had brought the constructive study of *Acts* almost to a deadlock. Nor have the results of recent similarly jealous suspicion (of which Loisy is the type) won any wide consensus among scholars.

**Date.**—External evidence points to the existence of *Acts* at least as early as the opening years of the 2nd century. The traces of it in Polycarp and Ignatius, when taken together, are highly probable; and the resemblance of Acts xiii 22, and I Clem. xviii 1, in features not found in the Psalm (lxxxix 20) quoted by each, can hardly be accidental (see *The N T. with Apostolic Fathers*, 48 *seq*). That is, *Acts* was probably current in Rome as early as *c.* A D 95. With this view internal evidence agrees. In spite of some advocacy of a date prior to A.D 70, the bulk of critical opinion is against it. The prologue to Luke's Gospel implies the dying out of eye-witnesses as a class. Many support a date about A D. 80; some prefer 75 to 80; while a date even before 75 seems possible. Of the reasons for a date in one of the earlier decades of the 2nd century, as argued by the Tubingen school, most are now untenable. Among these are the supposed traces of 2nd-century Gnosticism and "hierarchical" ideas of organization; while the argument from the relation of the Roman state to the Christians has been turned by Ramsay into proof of an origin prior to Pliny's correspondence with Trajan, *c.* 112. Another fact tells against a 2nd-century date, *viz.* the failure of a writer devoted to Paul's memory to avoid seeming conflict with his Epistles. If, indeed, *Acts* uses the later works of Josephus, we should have to place it about A D. 100. But this is far from proved.

Three points of contact with Josephus in particular are cited (1) The circumstances attending the death of Herod Agrippa I in A D 44. Here Acts xii. 21–23 is largely parallel to Jos. *Antt* xix 8. 2, but the latter adds an omen of coming doom, while *Acts* alone gives a circumstantial account of the occasion of Herod's public appearance. Hence the parallel, when analysed, tells against dependence. So also with (2) the case of the Egyptian pseudo-prophet in Acts xxi. 37 *seq.*, Jos. *Jewish War*, ii. 13 5, *Antt.* xx. 8. 6; for the numbers do not agree with either of Josephus's rather divergent accounts, while *Acts* alone speaks of *Sicarii* With these instances in mind, it is best to regard (3) the curious resemblance in v 36 *seq* and Jos. *Antt.* xx. 5. 1 as to the order in which Theudas and Judas of Galilee are referred to in both as accidental, the more so that again there is difference as to numbers. There may well have been another Theudas, in the period of many tumults after the death of Herod the Great to which Josephus refers in *Antt.* xvii. 10. 4, whom as a pseudo-Messiah on so small scale he might not think worth while mentioning after A.D. 70; whereas to Gamaliel the case was not long before his own time ("before these days"). Further, to make out a case for dependence, one must assume the mistaken order in Gamaliel's speech as due to gross carelessness in the author of *Acts* Such a mistake, if really there, was far more likely to arise in oral transmission of the speech, before it reached Luke at all.

**Place.**—The place of composition is still an open question. Rome and Antioch have been in favour; and Blass combined both views in his theory of two editions (*see* further, *Text*). But internal evidence points to the Roman province of Asia, and the neighbourhood of Ephesus. Note the confident local allusion in xix. 9 to "the school of Tyrannus"—not "a certain Tyrannus," as in the inferior text—and in xix. 33 to "Alexander"; also the very minute topography in xx. 13–15. Affairs in that region, including the future of the church of Ephesus (xx. 28–30), are treated as though they would specially interest "Theophilus" and his circle: also an early tradition makes Luke die in the adjacent Bithynia. An *apologia* for the Church against the Synagogue's attempts to influence Roman policy to its harm would be much to the point in "Asia" (*cf.* Rev. ii. 9, iii. 9, and Sir W. M. Ramsay, *The Letters to the Seven Churches*, ch. xii.).

**Text.**—The *apparatus criticus* of *Acts* has grown considerably of recent years; mainly in one direction, that of the so-called "Western text." This misleading term really stands for a glossing or paraphrastic text, comparable to a Targum on an Old Testament book, which became very widespread, in both east and west, for some 200 years or more from early in the 2nd century. The sifting, however, of the readings in all our witnesses (mss., versions, Fathers) has not yet gone far enough to yield final results as to the history of this text—what in its extant forms is primary, secondary, and so on. Beginnings only have been made towards grouping our authorities (see J. H. Ropes' fine study in *Beginnings of Christianity*, pt. i., vol. iii. pp. ccxv.). Assuming, however, that the original form of the "Western" text had been reached, the question of its historical value, *i.e.* its relation to the original text of *Acts*, would remain On this point the highest claims were made by Blass (1894 and later), who held that both the "Western" text of *Acts* (styled the $\beta$ text) and its rival, the text of the great uncials (the $\alpha$ text), are due to the author's own hand; and that the former (Roman) is more original than the latter (Antiochene); but the theory (as Ropes shows) is untenable. Sir W. M. Ramsay pointed the way to sounder views. Already in *The Church in the Roman Empire* (1893) he held that the "Western" text in the *Codex Bezae* rested on a recension made not later than about the middle of the 2nd century. Though "some at least of the alterations in *Codex Bezae* arose through a gradual process," the revision as a whole was the work of a single reviser. His aim, in suiting the text to the views of his place and time, was to make it at once more intelligible and more complete. In his later work, *St. Paul the Traveller and the Roman Citizen* (1895), Ramsay's views gained in breadth by looking beyond the Bezan text to the "Western" text as a whole.

But all earlier work on the text of *Acts* is summed up and improved in Ropes' monumental edition (as above). Generally speaking, the text as printed by Westcott and Hort, on the basis of the earliest mss. (ℵB), seems in *Acts*, as elsewhere, to be nearest to the autograph: the "Western" text, even in its earliest form, was a deliberate revision. This does not mean that it has no historical value of its own. Certain of its readings (*e.g.* xi. 28, xii. 10) may even date from the end of the 1st century and preserve living memories. But their value is mainly that of an early commentary, and lies in the light cast on ecclesiastical thought in certain quarters and epochs. *Acts*, from its very scope, was least likely to be viewed as sacrosanct in its text. Indeed there are signs that its undogmatic nature caused it to be comparatively neglected at certain times and places, as, *e.g.*, Chrysostom explicitly witnesses.

BIBLIOGRAPHY.—An account of the extensive literature that has gathered round *Acts* may be found in R. J. Knowling's ed. in *The Expositor's Greek Testament* vol. ii. (1900), and in his *Testimony of St Paul to Christ* (1905); C. Clemen, *Die Apostelgesch. im Lichte der neueren Forschungen* (Giessen, 1905); A. Harnack, *Acts of the Apostles* (1909); J. Moffatt's *Introduction to the N.T.* (1911 and [illegible] Foakes Jackson and Kirsopp Lake, *The* [illegible] pt. i. (1920–28); H. J. Cadbury, *The* [illegible] *Luke-Acts* (1927). (J. V. B.)

**ACTUALITY THEORY** is the view that the real is not a thing or a state at rest, but an activity or a process.

In philosophy the theory is as old as Heraclitus who conceived ultimate reality as an incessant becoming, not as static being. In modern philosophy Spinozism may be regarded as a form of this theory. For, notwithstanding the important place which the conception of "substance" holds in the philosophy of Spinoza, Spinozism when correctly interpreted is essentially dynamic, not static, in character. Of subsequent philosophers the following (among others) may be regarded as upholders of the actuality theory in some form or other. Fichte conceived of the real as the infinite activity of the absolute ego. Hegel regarded it as an absolute process, a kind of dialectical evolution. Schopenhauer described it as volitional activity or striving. Wundt likewise thought of reality as a complex of volitional activities or processes. For Bergson "there are no things, only activities" (*Creative Evolution*). Of philosophical men of science Mach, Ostwald, and Whitehead (among others) may be claimed as supporters of the actuality theory. Indeed the whole drift of present day science is to regard "events" rather than "things" as the ultimate components of the world of reality.

In psychology the actuality theory is mainly concerned with the nature of the soul or mind. According to the popular view, which is also supported by many psychologists, the mind or soul is a substance, an abiding something which owns the mental experiences of knowing, feeling, and willing, or which exercises these activities. As against this "substantial" view of the soul, the actuality theory in psychology treats the soul as just the complex or system of these activities, experiences, or processes, and no more. The view appears to be as old as Protagoras and Aristotle. It is quite explicit in Spinoza, for whom the human soul is just a complex of ideas, and ideas are not dead, static pictures on a canvas, but living activities. Hume likewise stated that his introspective attempt to catch a glimpse of his soul revealed to him nothing but "a bundle" of sensations, etc. Of modern psychologists, Fechner, Höffding, James, Baldwin, Ebbinghaus, Sully, and Wundt (among others) may be classed among the supporters of the actuality theory, while other psychologists are more or less in sympathy with it, though they regard the whole question as pertaining to philosophy rather than to psychology. On one point, however, all modern psychologists are agreed, namely, that mental experiences are essentially events, activities, or processes, not states. And this agreement is largely the result of the contention of the upholders of the activity theory.

**ACTUARY.** The name of *actuarius*, sc. *scriba*, in ancient Rome, was given to the clerks who recorded the *Acta Publica* of the senate, and also to the officers who kept the military accounts and enforced the due fulfilment of contracts for military supplies. In its English form the word has undergone a gradual limitation of meaning. At first it seems to have denoted any clerk or registrar; then more particularly the secretary and adviser of any joint-stock company, but especially of an insurance company; and it is now applied specifically to one who makes those calculations as to the probabilities of human life upon which the issuance of life insurance and annuity contracts depend.

In the life insurance companies of the U.S., Canada, and Great Britain, the actuarial departments are large and the position of the actuary important.

In the United States there are two scientific organizations for the promotion of actuarial science embracing members from Canada also.

One is the Actuarial Society of America, founded in 1889, with headquarters in New York. The other is the American Institute of Actuaries, founded in 1909, with headquarters in Chicago.

Admission to membership is by examination, and beginning in 1938 the two organizations adopted the practice of having identical examinations, set by a joint committee. The mathematical parts of the examinations include advanced algebra with special emphasis upon the theory of probability, the theory of compound interest, finite differences, the differential and integral calculus, and statistics. The other parts of the examinations include the application of mathematics to life contingencies, the compilation of tables of mortality, disability, sickness, accident, etc., the underwriting of risks, life insurance accounting, the theory of banking and finance, the investment of life insurance funds, and the law as it relates to life insurance contracts.

In Great Britain there are two actuarial organizations—one, the Institute of Actuaries founded in 1848, with headquarters at Staple Inn Hall, London, and the other, the Faculty of Actuaries, founded in 1856, with headquarters in Edinburgh. Both are incorporated by royal charters and admission to each is by examination.

In 1895 the first International Congress of Actuaries was held in Brussels.

(*See* also INSURANCE, ARTICLES ON.) (M. A. L.)

**ACUÑA, CHRISTOVAL DE** (1597–*c.* 1676), Spanish Jesuit missionary and explorer, was born at Burgos in 1597. He was sent on mission work to Chile and Peru, where he became rector of the college of Cuenca. In 1639 he accompanied Pedro Texiera in his second exploration of the Amazon, in order to take scientific observations, and draw up a report for the Spanish Government. The journey lasted ten months; on the explorer's

arrival in Peru, Acuña prepared his narrative, while awaiting a ship for Europe. The king of Spain, Philip IV., received the author coldly, and it is said even tried to suppress his book, fearing that the Portuguese, who had just revolted from Spain (1640), would profit by its information. Eventually Acuña returned to South America, where he died, probably soon after 1675. His *Nuevo Descubrimiento del Gran Rio de las Amazonas* was published at Madrid in 1641; French and English translations (the latter from the French), appeared in 1682 and 1698.

**ACUPRESSURE,** the name given to a method of stopping bleeding from an artery by passing a needle through the tissue so that the vessel is compressed. A loop of wire may be passed around the free ends of the needle so that there is more pressure. The method was advocated by Sir J. Y. Simpson.

**ACUPUNCTURE,** a form of surgical procedure, performed by pricking the part affected with a needle. It has long been used by the Chinese in cases of headaches, lethargies, convulsions, colics, etc. It is also used to obtain fluid, through a hollow needle, for its help in making a diagnosis. It is known as tapping.

**ADA,** a village of Hardin county, O., U.S., on the Pennsylvania railroad, 15 mi. E. of Lima. Pop. (1950) 3,629; it lies on the watershed between the Ohio river and the Great Lakes, in a rich agricultural district.

Chief manufactures are athletic goods, sheetmetal products, lumber and flour. The village is the seat of the Ohio Northern university (Methodist).

**ADA,** a city of Oklahoma, 85 mi. S.E. of Oklahoma City; served by the Santa Fe, the Frisco and the Oklahoma City-Ada-Atoka railways. Pop. (1950) 15,935. Ada is the county seat of Pontotoc county, which produces natural gas and petroleum, cotton, grain, livestock, sweet potatoes, peanuts and alfalfa; and has deposits of rock asphalt, glass sand, pottery clay, lead, zinc and other minerals. The city has cotton gins and compresses; feed and corn mills; cement, stone crushing, pottery and glassworks; brickyards and grain elevators. It is the seat of the East Central State college (1909). The city was incorporated in 1901. It has a council-manager form of government.

**ADAB** (modern BISMAYA), an ancient town in Mesopotamia, in 32° N., 45° 30′ E., 25m. S. of Nippur. It was supplied by a canal which passed through the city and irrigated the country, eventually falling into the Shatt al Hai. In the centre of the city the canal divided to form an island on which stood the temple of the mother Goddess Aruru, to whose cult the city was devoted. There are a succession of periods on the mound which rises 50ft. above the plain: 2 to 3 ft. below the platform of Ur Engur are the buildings of the kings of Akkad; 10ft. below are the plano-convex bricks of Unnina; 10ft. lower are buildings made of limestone blocks, which were used before the days of brickmaking. At a depth of 48ft. the excavators found thin unpainted wheel-made pots. The Ziggurat or temple tower is pre-Sargonic and one of the oldest in Sumer. One of the most remarkable finds was the head of a Semite in white marble.

The city appears to have enjoyed a restricted independence at the time of the kings and patesis of Lagash. The kings of Akkad and Ur certainly devoted a good deal of attention to the city, probably owing to its religious cults.

*See* E. J. Banks, *Bismaya or the Lost City of Adab* (1912); S. Langdon, in *Cambridge Ancient History*, vol i. 1923.

**ADABAZÁR** or ADAPAZARI, an important commercial town in the Izmir vilayet of Turkey, situated on the old military road from Constantinople to the east, and connected by a branch line with the Anatolian railway. Pop. (1945) 29,386. There are silk and linen industries and an export of tobacco, walnut-wood, cocoons and vegetables for the Istanbul market.

*See* V. Cuinet, *Turquie d'Asie* (Paris, 1890–1900).

**ADAD,** the name of the storm-god in the Babylonian-Assyrian pantheon, who is also known as Ramman ("the thunderer"). It seems that Ramman was the name current in Babylonia, whereas Adad was more common in Assyria. A god Hadad, a prominent deity in ancient Syria, is identical with Adad, whose name is therefore, an importation into Assyria from Aramaic districts. Ramman is identical with Rimmon, known to us from the Old Testament as the chief deity of Damascus. The cult of a specific storm-god in ancient Babylonia is vouched for by the occurrence of the sign Im—the "Sumerian" for Adad-Ramman—as an element in proper names of the old Babylonian period. Through Aramaic influences in Babylonia and Assyria he was identified with the storm-god of the western Semites. The designation Amurru is also given to this god in the religious literature of Babylonia, which describes him as belonging to the Amorite district.

On the one hand he brings on the rain in due season, and causes the land to become fertile; on the other hand, by the storms that he sends, he brings havoc and destruction. He is pictured on monuments and seal cylinders with the lightning and the thunderbolt, and in the hymns the sombre aspects of the god on the whole predominate. His association with the sun-god, Shamash, imbues him with some of the traits belonging to a solar deity. In the theological lists he follows Shamash. At Erech in the south and Assur in the north Adad is intimately associated with Anu, the sky god. In Syria Hadad is hardly to be distinguished from a solar deity. In Babylonia and Assyria Shamash and Adad became in combination the gods of oracles and of divination in general. In the annals and votive inscriptions of the kings, when oracles are referred to, Shamash and Adad are always named as the gods addressed, and their ordinary designation in such instances is *bēlē biri,* "lords of divination." The consort of Adad-Ramman is Shala, while as Amurru his consort is called Ashratum.

In magic rituals the symbol of Ramman is the cypress, and his sacred number is "six," consequently the sixth day of each month was sacred to him. The principal seat of the old Sumero-Babylonian cult of the thunder god was *Muru* (ki), which has not been located, and the cult is mentioned in connection with the cities Padda, Akus, Simurri and Halbaba, all unknown and certainly unimportant places; but a great temple to him and Anu has been excavated at Assur.

*See* the special study on this deity by Hans Schlobies, *Das akkadische Wettergott in Mesopotamien* (1925); also the article BABYLONIAN AND ASSYRIAN RELIGION.

**ADAEV,** now Chapaev, region of the Kazakh Soviet Socialist Republic. Area 117,114 sq.mi. Pop. 136,000 (urban 3,012). The area includes the Ust Urt plateau (700 ft.) in the south, and the low plain to the north of it which apparently once linked the Caspian and Aral seas, and which is studded with salt lakes with [illegible] evidence of this link. The soil is either gravelly and stony desert or alkaline and gypsiferous gray soil, so that vegetation is sparse. The nomad Kirghiz tribes are mainly herdsmen. The administrative centre is Chapaev. Fort Shevchenko, formerly Alexandrovsk on the Mangishlak peninsula, has a fishing industry (including seal fishery) and exports Glauber salts obtained from the shores of Kara Bugaz bay. On Mangishlak peninsula there is evidence of naphtha, ozokerite and bitumen deposits; also coal deposits were found there in 1940. In the northwest the province extends northward in a narrow strip nearly to lat. 50° N., and thus includes the naphtha area round Uilsk, where the population is mainly Russian and Tatar. Apart from this strip, the region is semi-desert; there is no railway.

**ADAGIO,** a term in music to indicate slow time; also a slow movement in a symphony, sonata, etc., or an independent piece, such as Mozart's pianoforte, "Adagio in B minor." The diminutive form *adagietto* means somewhat less slow than *adagio.*

**ADAIR, JOHN** (d. 1722), Scottish surveyor and map-maker of the 17th century. In 1703 he published the first part of his *Description of the Sea-coasts and Islands of Scotland,* for the use of seamen. The second part never appeared. Some of his work is preserved in the Advocates' Library (now the National Library of Scotland) at Edinburgh and in the King's Library of the British Museum, London.

**ADALBERON** or **ASCELIN** (d. 1030 or 1031), French bishop and poet, studied at Reims and became Bishop of Laon in 977. When Laon was taken by Charles, Duke of Lorraine, in 988, he was put into prison, whence he escaped and sought the

protection of Hugh Capet, King of France. Winning the confidence of Charles of Lorraine and of Arnulf, Archbishop of Reims, he was restored to his see, but he betrayed Laon, together with Charles and Arnulf, into the hands of Hugh Capet. He died on July 19, 1030 or 1031 Adalberon wrote a satirical poem in the form of a dialogue dedicated to Robert, King of France, in which he showed his dislike of Odilo, Abbot of Cluny, and his followers, and his objection to persons of humble birth being made bishops. The poem was first published by H Valois in the *Carmen panegyricum in laudem Berengarii* (Paris, 1663), and in modern times by J. P Migne in the *Patrologia Latina,* tome cxli. (Paris, 1844). Adalberon must not be confounded with his namesake, Adalberon, Archbishop of Reims (d 988 or 989).

BIBLIOGRAPHY—*See* Richer, *Historiarum libri iii. et iv.* which appears in the *Monumenta Germaniae historica, Scriptores* Band iii (Hanover and Berlin, 1826–92). A. Olleris, *Oeuvres de Gerbert pape sous le nom de Sylvestre II.* (Paris, 1867); *Histoire littéraire de la France,* tome vii. (Paris, 1865–69).

**ADALBERT** (*c.* 700), English saint, possibly a grandson of Oswald, king of Deira, was sent with St. Willibrord on a mission to the Frisians, and is said to have been the first archdeacon of Utrecht. In about 702 he went to preach in north Holland, where he built a church at Egmont. He is supposed to have died in 705, on June 25, and until the early 18th century that day was still kept sacred to his memory, as patron saint, in the village of Egmont. A life of Adalbert was compiled in the 10th century, by some monks in the diocese of Treves, and one by a monk at Egmont in the 12th century.

**ADALBERT** or **ADELBERT** (*c.* 1000–1072), German archbishop, was the son of Frederick, count of Goseck, a member of a noble Saxon family. Adalbert stood high in the favour of Henry III., whom he accompanied on many expeditions into Hungary, Italy, Slavonia and elsewhere. It is said that he might have been made Pope but that he saw greater possibilities of power and influence in northern Germany. In 1045 he was appointed archbishop of Hamburg-Bremen, his province including the Scandinavian countries, as well as the larger part of North Germany. He moved the seat of the bishopric from Bremen to Hamburg, sent missionaries to Finland, Greenland and the Orkney Islands. and aimed at making Bremen a patriarchal see for northern Europe, with 12 suffragan bishoprics.

He consolidated and increased the estates of the church, exercised the powers of a count, denounced simony, and initiated financial reforms. The presence of this powerful and active personality was greatly resented by the Saxon duke of the north, Bernard II., who regarded him as a spy sent by Henry. Adalbert gave substantial help to the emperor in the struggle with Baldwin, count of Flanders, by concluding a treaty (1049) with Sweyn of Norway and Denmark, who sent a fleet to the Netherlands coast. The archbishop's ambition to secure ecclesiastical control of northern Europe was furthered in 1052 by a papal brief which put all the Christians of the north, from the Icelanders in the west to the Finns in the east, under the see of Bremen. Adalbert himself became papal legate for the north. For a time his ecclesiastical pretensions estranged Sweyn, but in the end the Norwegian king acquiesced.

Adalbert, who wished to free his lands entirely from the authority of the duke, Bernard II., aroused hostility by an attack on the privileges of the great abbeys, and after the emperor's death in 1056 his lands were ravaged by Bernard. He took a leading part in the government of Germany during the minority of Henry IV., and was styled *patronus* of the young king, over whom he exercised considerable influence. Having accompanied him on a campaign into Hungary in 1063, he received large gifts of crown estates and obtained the office of count palatine in Saxony. His power aroused so much opposition that in 1066 the king was compelled to assent to his removal from court. In 1069 he was recalled by Henry, when he made a further attempt to consolidate a northern patriarchate, which failed owing to the hostility of the papacy and the condition of affairs in the Scandinavian kingdoms. He died at Goslar, and was buried in the cathedral which he had built at Bremen. Adalbert was a man of large ideas and a strong, energetic character. He fortified and improved Bremen, and it was called the *New Rome* by his biographer, Adam of Bremen

*See* Adam of Bremen, *Gesta Hammenburgensis ecclesiae pontificum,* edited by J M Lappenberg, in the *Monumenta Germaniae historica, Scriptores,* Band vii. (1826–92); C. Ehrenberg, *Adalbert Erzbischof von Hamburg und die Idee eines Nordischen Patriarchats* (1854).

**ADALBERT,** originally VOYTECH (*c.* 950–997), known as the apostle of the Prussians, the son of a Bohemian prince, was born at Libice (Lobnik, Lubik). He was educated at the monastery of Magdeburg; and in 983 was chosen bishop of Prague The extreme severity of his rule repelled the Bohemians, whom he vainly strove to wean from their national customs and pagan rites Discouraged by ill success, he withdrew to Rome until 993, when, in obedience to the Pope, he returned to his own people. Finding little amendment, however, in their course of living, he returned to Rome, and obtained permission from the Pope to devote himself to missionary labours in N. Germany and Poland While preaching in Pomerania he was assassinated by a heathen priest.

*See* U. Chevalier, *Répertoire des sources historiques du moyen âge,* Bio-Bibl. (1905); Bolland, *Acta Sanctorum,* April 23; H. G. Voigt, *Adalbert von Prag* (1898), a thoroughly exhaustive monograph.

**ADALIA,** the ancient *Attaleia* (*q.v.*) (med. *Antaliyah;* the crusaders' *Satalia*), the largest seaport on the south coast of Asia Minor, Turkey, though in point of trade second to Mersina. The unsuitability of the harbour for modern steamers, the bad anchorage outside and the extension of railways from Smyrna greatly lessened its former importance as an emporium for west central Anatolia, although it retains considerable importance as the administrative capital of a rich and isolated vilayet. Adalia played a considerable part in the mediaeval history of the Levant. Kilij Arslan had a palace there The army of Louis VII sailed thence for Syria in 1148, and the fleet of Richard of England rallied there before the conquest of Cyprus Conquered by the Seljuks of Konia, and made the capital of the province of Tekké, it passed after their fall through many hands, including those of the Venetians and Genoese. before its final occupation by the Ottoman Turks under Murad II (1432). The port is served by coasting steamers of the local companies only. Adalia is an extremely picturesque, but ill-built and backward place. Population (1950) 27,478.

*See* C. Lanckoronski, *Villes de la Pamphylie et de la Pisidie,* i. (1890).

**ADAM,** the Hebrew word for "man"; when used without the article implying the human species (*e.g.,* Gen. i. 26 and the familiar phrase "son" or "sons of man," *i.e.,* a human being or human beings), with the article a human individual, corresponding generally to the Latin *homo* and the Greek *ἄνθρωπος.* (The absence of the article in Gen. ii. 20b and iii. 17 is probably accidental, being due to the vocalization of the Hebrew text, not to its original consonants.) But in Gen. ii. 25 and v. 1 it *may* be a proper name, applied to the first man created. It is certainly in this sense that the word is employed in Gen. v. 2–6, and so it has been generally used, in the popular language both of Jews and of Christians.

The narrative of Gen. i. in giving an account of the "creation" of man does not necessarily imply that a single pair only was thus formed at the first. Throughout that chapter the impression the reader receives is that a large number of individuals in each species come into being at once. This, however, in its present form, is the later of the two narratives of creation, though it is probably a revision of a very ancient tradition, going far back behind the earliest appearance of Israel as a nation, and based on that common stock of thought which spread from Mesopotamia over western Asia before the middle of the 2nd millennium B.C.

With the narrative in Gen. ii. 4–25—the earlier in its present form—the case is different. Here we have most certainly the theory that all humanity is sprung from a single pair, a "man" and his "woman." The narrative is naïve in its detail and elementary in its theology. There is no account of the creation of the earth, or speculation as to how it came into being; it is

assumed. There is, however, no life, whether animal or vegetable, and the ordinary processes of the weather have not yet begun. The clayey soil is moistened by "mist," and from this material "Yahweh," afterwards to be the God of Israel, models the figure of a man. Then He breathes into his nostrils, and so—breath being regarded as one of the primary "givers of life"—brings to life this earthen model. The next problem is what to do with this living toy, and Yahweh makes a proper home for him by planting a garden and making all kinds of useful trees grow in it. There is

AFTER A WOODCUT FROM "BERGOMENSIS, SUPPLEMENTUM CHRONICARUM," VENICE, 1492

EVE TEMPTING ADAM TO EAT THE FORBIDDEN FRUIT AND THEIR EXPULSION FROM THE GARDEN OF EDEN

more to be done, the man's needs are far from being satisfied, for he will require suitable companionship. It is not enough that he should exist alone, and experiment alone can show what will satisfy him.

Yahweh's first attempt at providing a suitable companion follows the method by which the man himself has been made. All kinds of forms are modelled from the wet clay, and brought before the man. At the sight of each he makes some sound, and the sound, expressing as it does the man's attitude towards the creature, becomes its name. But in no case does the name thus spontaneously given suggest that the problem is solved; the experiment has failed. Another method must be tried. Yahweh throws the man into an anaesthetic slumber and takes a rib from his side, carefully mending the place afterwards. Then He "builds" the rib into a form, and brings that to the man. Now he exclaims "wo-man," and the terms in which he greets the new figure show that at last the experiment is successful. Ultimately from this pair the whole human race descends.

Here, then, we have certain theories about human nature, held by the Israelite of the middle monarchy. Though the view of God is crude and anthropomorphic, yet it is clear that He is the author of man's being. Man's nature is bipartite—it is assumed that what is true of the common ancestor will be true of all his descendants. He consists of a body, made of the same kind of material as the soil from which all things spring, together with another element, a life-soul, which does not come from the ground, but is imparted by God Himself. The difference between the sexes is recognized, as also the fact that they are mutually complementary, but the sex instinct is at present undeveloped.

Other familiar features of human life are thus left unexplained. Man no longer lives in the garden, nor finds that the soil always yields a generous response to his efforts. The sex life is strongly developed and the subordination of woman is generally recognized. The hostility between man and other creatures, especially the snake tribe, needs explanation, and all these facts are accounted for in the second narrative, that of Gen. iii, commonly described as the story of the Fall.

Such is the Biblical story of the first man, and, apart from genealogies in Gen iv. 25, v. 1–6, Chron. i. 1, he is never mentioned again by name in the Old Testament. The narrative has affinities with others known to the ancient world, and the story of the Fall, at least, has a parallel in Ez xxviii Mesopotamians told of the formation of man from clay mingled with the blood of Bel, of Adapa, who narrowly missed attaining immortality, and of Ea-bani, made by Ishtar from clay, and seduced from his wild and primitive ways by a harlot. If all these have a common source with the Biblical narrative (which is quite possible), then we are more than ever impressed with the way in which the Hebrew genius for religion transmuted them, and, in spite of the crudities of language and thought, adapted them to universal religious experience.

Later thinkers and writers greatly expanded the story, and drew from it conclusions which were originally foreign to it. Rabbinic thought ascribed to Adam before the Fall a superhuman grandeur. One legend indeed, followed in the Koran, relates that all the angels were ordered to fall down and worship Adam, and that Satan refused, on the ground that he was made of fire and the man of clay. Others ascribed to Adam's fall the mortality of the human race, though in the original story there is no suggestion that man was originally created immortal. The doctrine of hereditary guilt appeared, and has formed the basis of much Christian theology. Apart from a single reference in Jude 14 and the mention of the name in the Lucan genealogy of Christ, St. Paul is the only New Testament writer who mentions Adam He regards him as a type or summary of the whole human race in its natural state, and contrasts him and his kind with the new order of being that came into existence with Christ—"the second Adam," the originator of the higher spiritual plane. To him the "natural" man is, as to the old Hebrew, bipartite, consisting of "flesh" and "life"; the man who is in Christ has received a third element, the "Spirit" And to Pauline thought Christ is the starting point at which this third element first enters, just as the "Adam" of Gen. i.–v. is the starting point of the lower human order. (T. H. R)

**ADAM,** the name of a family of French sculptors. LAMBERT SIGISMUND (1700–1759) executed many pieces for the French royal residences and for Frederick the Great of Prussia NICOLAS SÉBASTIEN, his brother (1705–1778), was responsible for the tomb of Catherine Opalinska at Nancy. Another brother, FRANÇOIS GASPARD BALTHASAR, executed many of the monuments at Sans Souci and Potsdam.

*See* Dussieux, *Artistes français à l'étranger* (1855); Lady Dilke, *French Architects and Sculptors of the 18th century* (1900).

**ADAM, ADOLPHE CHARLES** (1803–1856), French composer of light operas which enjoyed great favour, was born in Paris July 24, 1803, and died there May 3, 1856. Boieldieu taught and encouraged him and he became in due course one of the most prolific and popular composers of his time. Of his 53 stage works *Le Postillon de Longjumeau* merits particular mention, while his ballet *Giselle* is still performed

**ADAM, ALEXANDER** (1741–1809), Scottish teacher and antiquarian, was born on June 24, 1741 near Forres, Morayshire, and died in Edinburgh on Dec. 18, 1809. He became rector of Edinburgh High School in 1768, and had among his pupils many boys who afterwards became famous, among them Sir Walter Scott, Lord Brougham, and Jeffrey. He introduced Greek into the school curriculum, and defied tradition by publishing a *Principles of Latin and English Grammar* in English instead of Latin. His best-known work is his *Roman Antiquities* (1791).

*See* A. Henderson, *An Account of the Life and Character of A. A.* (1810).

**ADAM, SIR FREDERICK** (1781–1853), British general, fought during the Napoleonic wars from Egypt, in 1801, to Waterloo; afterwards he was high Commissioner of the Ionian Isles and governor of Madras.

**ADAM, JULIETTE** (1836–1936), French writer, known also by her maiden name of Juliette Lamber, was born at Verberie (Oise) Oct. 4, 1836. She has given an account of her childhood, rendered unhappy by the dissensions of her parents, in *Le Roman de mon enfance et de ma jeunesse* (Eng. trans., 1902). In 1852 she married a doctor named La Messine, and published in 1858 her *Idées antiproudhoniennes sur l'amour, la femme et le mariage,*

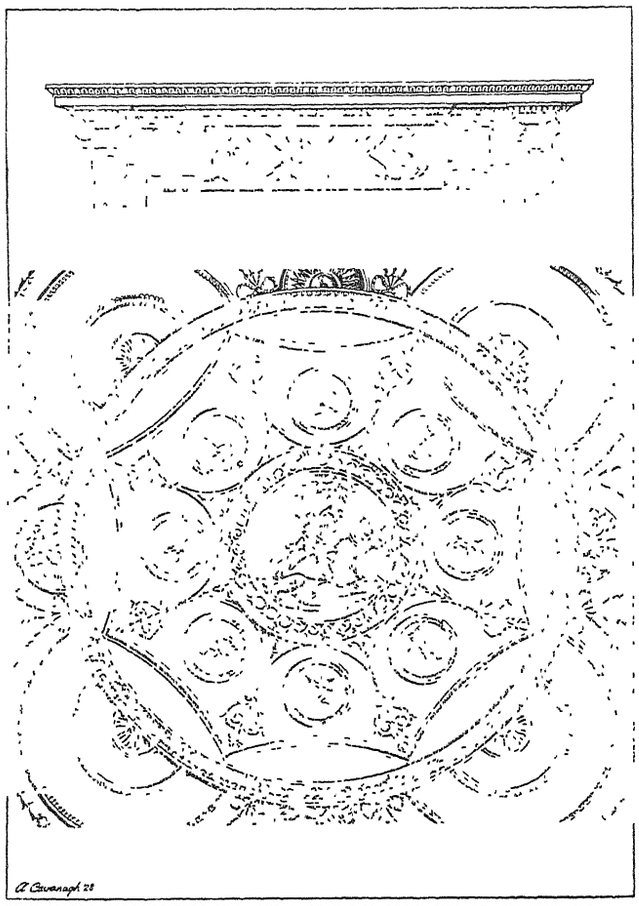
in defence of Daniel Stern (Mme. d'Agoult) and George Sand On her husband's death she married, in 1868, Antoine Edmond Adam (1816–1877), prefect of police in 1870, and subsequently life-senator; and she established a salon which was frequented by Gambetta and the other republican leaders against the conservative reaction of the 'seventies. In the same interest she founded in 1879 the *Nouvelle Revue,* which she edited for the first eight years, and in the administration of which she retained a preponderating influence until 1899. She wrote the notes on foreign politics, and was unremitting in her attacks on Bismarck and in her advocacy of a policy of *revanche.* The famous *Lettres sur la politique extérieure* in this review are from her pen. Mme. Adam was also generally credited with a share in the authorship of papers on various European capitals signed "Paul Vasili." The most famous of her numerous novels is *Païenne* (1883) Her reminiscences, *Mes premières armes littéraires et politiques* (1904), *Mes sentiments et nos idées avant 1870* (1905), and later volumes in 1907, 1909 and 1910, contain much interesting gossip about her distinguished contemporaries. Mme. Adam saw the revolution of '48, the Second Empire, the Siege of Paris, the Treaty of Versailles, and lived to see the *revanche* she had fought and prayed for when the second Treaty of Versailles was signed in 1919 In her youth she had belonged to the anti-clerical Liberal Party, but in the disillusionments of her later days she moved with her time, and just as *Païenne* had reflected a free-thinking age, *Chrétienne* (1913) was a glorification of the Catholic tradition. She died on Aug. 23, 1936.

*See* W. Stephens, *Madame Adam, la grande française* (1917).

**ADAM, MELCHIOR** (d. 1622), German divine and biographer, wrote *Vitae Germanorum philosophorum* (Heidelberg-Frankfurt, 1615–20). Pierre Bayle acknowledges his debt to this work, which deals principally with German scholars of the 16th century.

**ADAM, PAUL** (1862–1920), French novelist, was born in Paris on Dec. 7, 1862, and died there on Jan. 2, 1920. He was prosecuted for his first novel, *Chair molle* (1885), but was acquitted. He collaborated with Jean Moréas in *Le thé chez Miranda* (1886), and with Moréas and Gustave Kahn he founded the *Symboliste,* coming forward as one of the earliest defenders of symbolism. Among his numerous novels should be noted *Le mystère des foules* (1895), a study in Boulangism, *Lettres de Malaisie* (1897), a fantastic romance of imaginary future politics. In 1899 he began a novel-sequence, giving the history of the Napoleonic campaigns, the restoration, and the government of Louis Philippe, comprising *La force* (1899), *L'enfant d'Austerlitz* (1901), *La ruse* (1902), and *Au soleil de Juillet* (1903). In 1900 he wrote a Byzantine romance, *Basile et Sophia.*

He was an indefatigable traveller, and in his later years much occupied with economic theory. *Le Trust* (1910) was the fruit of one of his journeys to America. Later books were *Stéphanie* (1918) and during the World War *Reims devastée* and *Le Lion d'Arras.*



**ADAM, ROBERT** (1728–1792), British architect, the second son of William Adam of Maryburgh, in Fife, and the most celebrated of four brothers, John, Robert, James, and William Adam, was born at Kirkcaldy in 1728. He studied at the University of Edinburgh, and probably received his first instruction in architecture from his father, who gave proofs of his own skill and taste in the Edinburgh Royal Infirmary (now demolished). Somewhere between 1750 and 1754 he visited Italy, where he spent three years studying the remains of Roman architecture. There he was struck with the circumstance that practically nothing had survived of the Greek and Roman masterpieces except public buildings, and that the private palaces, which Vitruvius and Pliny esteemed so highly, had practically vanished. One example of such work, however, was extant in the ruins of Diocletian's palace at Spalato, in Dalmatia, and this he visited in July 1757, taking with him the famous French architect and antiquary, C. L. Clérisseau, and two experienced draughtsmen, with whose assistance, after being arrested as a spy, he managed in five weeks to accumulate a sufficient number of measurements and careful plans and surveys to produce a restoration of the entire building in a fine work which he published in 1764, *The Ruins of the Palace of Diocletian, etc.* Adam regarded this as the last great achievement of Roman architecture, whereas to later students it appears to mark the beginning of the decadence. The influence of these studies was apparent directly and indirectly in much of his subsequent work, which, indeed, was in great measure founded upon them.

After his return to England he came rapidly to the front, and in 1762 he was appointed sole architect to the king and the Board of Works. Six years later he resigned this office, in which he was succeeded by his brother James—who, however, held the office jointly with another—and entered parliament for the county of Kinross. In 1768 he and his three brothers leased the ground fronting the Thames, upon which the magnificent terrace of the Adelphi, one of their greatest achievements, was built for £1,200 on a 99 years' lease The Adelphi was still standing in 1928, though imminently in danger from rebuilding proposals The site presented attractive possibilities A steep hill led down Buckingham street to the river-side, and the plan was to raise against it, upon a terrace formed of massive arches and vaults and facing the river, a dignified quarter, of fine streets and stately buildings, suggestive of the Spalato ruins. Splendid, however, as the terrace and its houses are, both in conception and execution, the underground work which upholds them is perhaps more remarkable still Between 1773 and 1778 the brothers issued a fine series of folio engravings and descriptions of the designs for many of their most important works, which included several great public buildings and numberless large private houses; a fine volume was published in 1822 For the remaining years of Robert's life the practice of the firm was the most extensive in the country; his position was unquestioned, and when he died in 1792 he was laid to rest in Westminster Abbey almost as a matter of course.

As an architect, Adam was strongly under Roman and Italian influences, and his style and aims were exotic rather than native. It was the signal triumph of his genius that he was able so to mould and adapt classical models as to create a new manner of the highest charm and distinction. Out of simple curvilinear forms, of which he principally preferred the oval, he evolved combinations of extraordinary grace and variety, and these entered into every detail of his work. In his view the architect was intimately concerned with the furniture and the decorations of a building as well as with its form and construction, and this view he carried rigorously into practice, and with astonishing success. But whatever care he might have expended upon the flowing curves of a moulding or a decoration, it was strictly kept in its place; it contributed its share and no more to the total effect. He imparted the unity of a single imposing structure to a number of private houses grouped in a block which is so characteristic a feature of modern town building. A delightful but theoretically undesirable characteristic of his work is the use of stucco. Upon it he moulded delicate forms in subtle and beautiful proportions. His "compo" was used so successfully that the patent was infringed; many of his moulds still exist and are in constant use. That most difficult feature, the column, he handled with enthusiasm and perfect mastery; he studied and wrote of it with minute pains, while his practice showed his grasp of the subject by all avoidance of bare imitation of the classic masters who first brought it to perfection. His work might be classic in form but it was independently developed by himself. It would be impossible here to give a list of the innumerable works which he executed. In London, of course, the Adelphi stands pre-eminent; the screen and gate of the Admiralty and part of Fitzroy square are by him, and much of the older portion of Finsbury circus, besides whole streets of houses in the west end. There are the famous country houses of Lord Mansfield at Kenwood (Highgate) and Luton Hoo, and decorations and additions to many more.

Robert Adam—with, there is reason to suspect, some help from his brother James—has left as deep and enduring a mark upon English furniture as upon English architecture. Robert Adam was no doubt at first led to turn his thoughts towards furniture by his desire to see his light, delicate, graceful interiors, with their large

sense of atmosphere and their refined and finished detail, filled with plenishings which fitted naturally into his scheme. His own taste developed as he went on, but he was usually extremely successful, and cabinetmakers are still reproducing his most effective designs. In his furniture he made lavish use of his favourite decorative motives—wreaths and paterae, the honeysuckle and the fan ornament which he used so constantly. Thus an Adam

FROM BOLTON, "ARCHITECTURE OF R AND J ADAM," BY PERMISSION OF "COUNTRY LIFE"

A CHARACTERISTIC MANTELPIECE BY ROBERT ADAM IN THE ADELPHI. DETAIL OF ADAM DRAWING-ROOM CEILING IN GARRICK'S HOUSE, ADELPHI

house is a unique product of English art. From façade to fire-irons, from the chimneys to the carpets, everything originated in the same order of ideas, and to this day an Adam drawing room is to English what a Louis Seize room is to French art. In nothing were the Adams more successful than in the fine proportions of their mantelpieces and doors. The former, by reason of their simplicity and the readiness with which the "compo" ornaments can be applied and painted, are still made in cheap forms in great number.

John Adam succeeded to his father's practice as an architect in Edinburgh. James Adam studied in Rome, and eventually was closely associated with Robert; William is variously said to have been a banker and an architect.

*See* John Swarbrick, *Robert Adam and His Brothers* (1916); Arthur T. Bolton, *Architecture of Robert and James Adam* (1922). Both are illustrated. Mr. Bolton's book contains photographs of many Adam houses, and of many Adam interiors; among country houses, Hatchlands, Shardeloes, Harewood house, Bowood, Kedleston, Syon house and Kenwood; among the great houses of London, Lansdowne house; and many public and private buildings in Scotland.

**ADAM, WILLIAM** (1751–1839), British lawyer and politician, was a Whig and a supporter of the policy of Fox. At the English bar he obtained a very considerable practice. He was successively attorney and solicitor general to the prince of Wales, one of the managers of the impeachment of Warren Hastings, and one of the counsel who defended the first Lord Melville when impeached.

**ADAMAWA,** a region in the Sudan which lies roughly between 6° and 11° N and 11° and 15° E During the 19th century it was an independent emirate (or sultanate), but is now partitioned between British Nigeria and British and French Cameroons In all these territories administrative units with the name Adamawa survive

Adamawa owes its origin and name to Adama, a Fulani emir who established the emirate during the first half of the 19th century In 1809, under the leadership of Othman dan Fodio of Sokoto, the Moslem Fulani who had lived in the Sudan for many centuries began a holy war (*Jihad*) against the non-Moslem Negroes Adama conquered the area now known as Adamawa where he and his Fulani followers established an aristocracy controlling the many tribes such as Batta, Chamba and Lala which had opposed Fulani rule. Adama, who died in 1848, made Yola his capital and founded such cities as Garua, Ngaundere, Tibati, and placed them under the rule of Fulani emirs

Adama was succeeded by four of his sons. Lowal (1848–72) was ruling when H. Barth visited Adamawa (1851); Saanda (1872–90) consolidated the empire, Zubeiru (1890–1901) attempted to defend it against Great Britain and Germany but in 1903 he was killed by rebellious Lala when fleeing from his pursuers After Adamawa had been partitioned in 1901, Bobo Amadu, Adama's fourth son, became emir of Yola, the British section of the state.

Adamawa is a hilly region which is traversed by the Benue river Although predominantly flat (average about 1,000 ft.), there are a few high mountain groups of which Mt. Alantika (6,000 ft.) and the Mandara mountains are the most prominent The densely populated area belonging to the savanna zone is rather fertile and offers opportunities for agricultural and pastoral pursuits While the Negro groups grow durra, groundnuts, yams and cotton, the Fulani are primarily cattle breeders Hausa, Kanuri and Arabs live as traders throughout Adamawa.

(*See* also CAMEROONS; NIGERIA.)

**ADAM (or ADAN) DE LE HALE** (*c* 1238–1288), French troubadour, was born at Arras. His patronymic is generally modernized to La Halle, and he was commonly known to his contemporaries as Adam d'Arras or Adam le Bossu, sometimes simply as Le Bossu d'Arras. Adam studied grammar, theology and music at the Cistercian abbey of Vaucelles, near Cambrai. He joined the household of Robert II, count of Artois, in 1272; and from 1283 was attached to Charles of Anjou, brother of Charles IX, whose fortunes he followed in Egypt, Syria, Palestine and Italy. At the court of Charles, after he became king of Naples, Adam wrote his *Jeu de Robin et Marion,* the most famous of his works. He died between 1285 and 1288. Adam's shorter pieces are accompanied by music, of which a transcript in modern notation, with the original score, is given in E. de Coussemaker's edition.

His *Jeu de Robin et Marion* is cited as the earliest French play with music on a secular subject, and on the strength of it he has been dubbed by some the father of *opéra comique* It takes the form of a dramatic pastoral introducing a number of characters and consists of a dialogue varied by refrains already current in popular song. The melodies to which these are set have the character of folk music, and are more spontaneous and melodious than the more elaborate music of his songs and motets. A modern adaptation, by Julien Tiersot, is occasionally performed. Another of his plays, *Le jeu Adan* or *Le jeu de la Feuillée* (*c.* 1262), was a satirical drama in which he introduced himself, his father and the citizens of Arras, with their peculiarities. His works include further a *Congé,* or satirical farewell to the city of Arras, and an unfinished *chanson de geste* in honour of Charles of Anjou, *Le roi de Sicile,* begun in 1282.

BIBLIOGRAPHY—The only ms. which contains the whole of Adam's work is the La Vallière ms. (No. 25, 566) in the Bibliothèque Nationale, Paris, dating from the latter half of the 13th century. Many of his pieces are also contained in Douce ms. 308, in the Bodleian library, Oxford. His *Oeuvres complètes* (1872) were edited by E. de Coussemaker. *See* J. Tiersot, *Sur le jeu Robin et Marion* (1898); L. Nicod, *Les Partures Adan, Les Jeux partis d'Adam de la*

*Halle* (1917); and, for full bibliography of works on the subject, No. 6 of the *Bibliothèque de bibliographies critiques,* by Henri Guy.

**ADAMITES** or **ADAMIANS,** a sect of heretics that flourished in North Africa in the 2nd and 3rd centuries Basing itself probably on a union of certain gnostic and ascetic doctrines, this sect pretended that its members were re-established in Adam's state of original innocency

**ADAMNAN** or **ADOMNAN** (*c.* 624–704), Irish saint and historian, was born at Raphoe, Donegal, Ireland. In 679 he was elected abbot of Hy or Iona, being ninth in succession from the founder, St Columba. In 686, while on a visit to King Aldfrith of Northumbria, he was led to adopt the Roman rules on the date of Easter and on the tonsure, but failed to enforce the change upon his monks.

We owe to Adamnan two valuable works, the anecdotic *Life of St Columba,* preserving the authentic traits of the saint, and the *De locis sanctis,* an account of Arculf's travels in the Holy Land, which, in the longer version of Bede, was a kind of guidebook to the holy places in Palestine throughout the middle ages.

Adamnan is sometimes credited with *Adamnan's Vision,* the Irish version of which is in a 12th century ms in Dublin

BIBLIOGRAPHY.—Thirteen mss of the original Arculf-Adamnan narrative exist, and fully 100 of Bede's abridgment of the former, the most important, containing all the plans, are (1) Berne, Canton library, 582, of 9th century, (2) Paris, National library, Lat 13,048, of 9th century, a third ms, London, Brit Mus, Cotton, Tib D V., of 8th–9th centuries, though damaged by fire and lacking the illustrations, is of value for the text, being the oldest of all The best edition is that of Tobler in *Itinera et [illegible] Sanctae* (1877); we may also mention that of [illegible]s *Essai sur les anciens pèlerinages à Jérusalem.* [illegible] remarks upon Arculf in the same work, 260–304, C R. Beazley, *Dawn of Modern Geography,* i, 131–41 (1897); and J L. Macpherson, *Arculfus' Pilgrimage to the Holy Land* (1899) The *Life of St. Columba* was edited by J. T. Fowler (1894).

**ADAM OF BREMEN** (died *c.* 1076), historian and geographer, was, according to one tradition, born at Meissen (Saxony) before 1045. In 1069 he appears as a canon of Bremen and master of the cathedral school On the death of Adalbert, archbishop of Bremen, in 1072, he began the *Historia Hammaburgensis Ecclesiae,* which he finished about 1075 Adam's *Historia*—known also as *Gesta Hammaburgensis Ecclesiae Pontificum, Bremensium praesulum Historia* and *Historia ecclesiastica*—is a primary authority, not only for the great diocese of Hamburg-and-Bremen, but for all north German and Baltic lands (down to 1072), and for the Scandinavian colonies as far as America.

Here occurs the earliest mention of Vinland, and here are also references of great interest to Russia and Kiev, to the heathen Prussians, the Wends and other Slav races of the south Baltic coast, as well as to Finland, Thule or Iceland, Greenland and the polar seas, which Harald III (Haardraade) and the nobles of Frisia had attempted to explore in Adam's own day (before 1066) Adam's account of north European trade at this time, and especially of the great markets of Jumne at the mouth of the Oder, of Birka in Sweden and of Ostrogard (old Novgorod?) in Russia, is also of much value.

His work, which places him among the first and best of German annalists, consists of four books or parts, and is compiled partly from written records, and partly from oral information mainly gathered from experience or at the courts of Adalbert and Sweyn II (Estrithson), king of Denmark. Of his minor informants he names several, such as Adelward, dean of Bremen, and William the Englishman, "bishop of Zealand," formerly chancellor of Canute the Great, and an intimate of Sweyn Estrithson. The fourth (perhaps the most important) book of Adam's *History,* variously entitled *Libellus de Situ Danae et reliquarum quae trans Daniam sunt regionum, Descriptio Insularum Aquilonis,* etc., has often been considered, but wrongly, as a separate work.

BIBLIOGRAPHY.—Ten mss. exist, of which the chief are (1–2) Copenhagen, Royal library, Old Royal Collection, No. 2296, of 12th to 13th cents.; No. 718, of 15th cent.; (3) Leyden university, Voss Lat. 123, of 11th cent., (4) Rome, Vatican library, 2010; (5) Vienna, Hof-u. Staatsbibliothek, 413, of 13th cent.; (6) Wolfenbüttel, Ducal library, Gud. 83, of 15th cent. There are 15 editions of the *Historia,* in whole or part, the first published at Copenhagen (1579; the first of the *Libellus* or *Descriptio Insulae Aquil* appeared at Stockholm in 1615), the best at [illegible] (1846, by Lappenberg in *Scriptores Rerum Germanicarum,* re-issued by L Weiland, 1876), and at Paris (1884, in Migne's *Patrologia Latina,* cxlvi) *See* also C R Beazley, *Dawn of Modern Geography,* ii, 514–48 (1901)

**ADAMS, ABIGAIL SMITH** (1744–1818), wife of John Adams (*q.v.*), second president of the United States, was born in Weymouth, Mass., on Nov. 23, 1744 She was the daughter of William Smith, a Congregational minister, and was descended through her mother, Elizabeth Quincy, from Thomas Shepard of Cambridge, a noted Puritan divine. Despite scanty education and delicate health, she became a terse and vigorous writer and exercised much influence on the social and political life of her time. In 1764 she was married to John Adams, then practising law in Boston. During the first ten years of this union she lived in peace and quiet, though always ardently sharing her husband's interests in the growing disputes that culminated in war In this period she became the mother of a daughter and three sons, one of whom, John Quincy Adams, rose to the presidency of the United States. But during the second ten years of married life she was practically separated from her husband, who was absent attending congress and serving on diplomatic missions in Europe. She resolutely supported him in his insistence upon the Declaration of Independence and aided him and his cause with loyal zeal.

In 1784 she rejoined her husband in France and in 1785 accompanied him to England, where, as the wife of the first minister of the United States, the then but newly lost American colonies, to the court of George III. she met with social discourtesies which she long resented From 1789 to 1801, when her husband was successively vice-president and president, she lived in a simple manner in Washington. Since the publication by C F. Adams in 1876 of *The Familiar Letters of John Adams and his Wife* increased interest has centred in the career of the stout-hearted Puritan woman who was both the wife and the mother of a president of the United States. She died at Braintree, now Quincy, Mass., on Oct. 28, 1818.

**ADAMS, BROOKS** (1848–1927), U.S. historian, was born in Quincy, Mass., June 24, 1848. He graduated from Harvard university in 1870. and practised law in Boston until 1881. Thanks to a large inheritance, he had ample independent income which enabled him to travel extensively in Europe, the middle east and India. Very close to his elder brother Henry, also a historian, Brooks carried on with him an active correspondence in which they both developed the idea, revolutionary at the time, that by its nature and substance U S democracy was foreordained to degradation and decay In 1895 he published his *Law of Civilization and Decay* in which he developed his theory of history, the conviction that the centre of trade had consistently followed a westward movement from the ancient crossroads in the east to Constantinople, Venice, Amsterdam and finally London, occurring in accord with a law relating to the density of populations and the development of new and centralizing techniques of trade and industry.

His *America's Economic Supremacy* (1900) accurately foresaw within 50 years a world in which there would be only two powers, Russia and the United States, with the latter possessing economic supremacy. In 1913 he published *The Theory of Social Revolutions,* a study of defects in the American form of government, developing the idea of the imminent danger in the existence of great wealth exerting private power but declining to accept responsibility. After Henry Adams' death, Brooks Adams prepared for publication his brother's book *The Degradation of the Democratic Dogma* (1920) to which he wrote the introduction, a kind of family chronicle that began with John Quincy Adams' troubles and ended with the renunciation by the two grandsons of the democratic dogma. The roots of his Puritan ancestry were deep. An agnostic, a profound sceptic, he [illegible] last years of his life to the church at Quincy where, overcoming his lifelong shyness, he stood up and made a

public profession of his faith. Brooks Adams died in Boston, Feb. 13, 1927.

Adams' other writings include *The Emancipation of Massachusetts: The Dream and the Reality* (rev. ed., 1919); *The New Empire* (1902); *America's Economic Supremacy* (rev. ed., 1947). (M. W. CH.)

**ADAMS, CHARLES FOLLEN** (1842–1918), U.S. humorous poet, was born in Dorchester, Mass., April 21, 1842. He received a common school education. Early in the Civil War he entered the Union army and at Gettysburg was wounded and taken prisoner. In 1872 he began writing verses in German dialect, chiefly humorous, for juvenile periodicals. Collections of his verse were published under the title *Leedle Yawcob Strauss, and Other Poems* (1877) and *Dialect Ballads* (1887). His complete poetical writings under the title *Yawcob Strauss, and Other Poems,* with illustrations by "Boz," were published in 1910. He died in Boston, Mass., March 8, 1918.

**ADAMS, CHARLES FRANCIS** (1807–1886), U.S. diplomatist, son of John Quincy Adams, and grandson of John Adams, was born in Boston, Mass., Aug. 18, 1807. His father, having been appointed minister to Russia, took him in 1809 to St. Petersburg, where he acquired a perfect familiarity with French, learning it as his native tongue. After eight years spent in Russia and England, he attended the Boston Latin school for four years, and in 1825 graduated at Harvard. He lived for two years in the executive mansion, Washington, during his father's presidential term, studying law and moving in a society where he met Webster, Clay, Jackson and Randolph. Returning to Boston, he devoted ten years to business and study, and wrote for the *North American Review.* He also undertook the management of his father's pecuniary affairs, and actively supported him in his contest in the house of representatives for the right of petition and the anti-slavery cause. In 1835 he wrote an effective and widely read political pamphlet, entitled, after Edmund Burke's more famous work, *An Appeal from the New to the Old Whigs.* He was a member of the Massachusetts general court from 1840 to 1845, sitting for three years in the house of representatives and for two years in the senate; and in 1846–48 he edited a party journal, the *Boston Whig.* In 1848 he was prominent in politics as a "Conscience Whig," presiding over the Buffalo convention which formed the Free Soil party and nominated Martin Van Buren for president and himself for vice-president. He was a Republican member of the 36th congress, which assembled Dec. 5, 1859, and during the second session (Dec. 3, 1860–March 4, 1861) he represented Massachusetts in the congressional committee of 33 at the time of the secession of seven of the southern states. His selection by the chairman of this committee, Thomas Corwin, to present to the full committee certain propositions agreed upon by two-thirds of the Republican members and his calm and able speech of Jan. 31, 1861, in the house served to make him conspicuous before congress and the country. Together with William H. Seward, he stood for the Republican policy of concession; and, while he was criticized severely and charged with inconsistency in view of his record as a "Conscience Whig," he was of the same mind as President Lincoln, willing to concede nonessentials, but holding rigidly to the principle, properly understood, that there must be no extension of slavery. He believed that as the Republicans were the victors they ought to show a spirit of conciliation, and that the policy of righteousness was likewise one of expediency, since it would have for its result the holding of the border slave states with the north until March 4, when the Republicans could take possession of the government at Washington. With the incoming of the new administration Secretary Seward secured for Adams the appointment of minister to Great Britain. So much sympathy was shown in England for the south that his path was beset with difficulties; but his mission was to prevent the interference of Great Britain in the struggle; and while the work of Lincoln, Seward and Sumner, and the cause of emancipation, tended to this end, the American minister was insistent and unyielding, and knew how to present his case forcibly and with dignity. He laboured with energy and discretion to prevent the sailing of the "Alabama"; and, when unsuccessful in this, he persistently urged upon the British government its responsibility for the destruction of American merchant vessels by the privateer. In his own diary he shows that underneath his calm exterior was keen anxiety. Adams was instrumental in getting Lord John Russell to stop the "Alexandra," and to order the detention in Sept. 1863 of the two ironclad rams intended for the Confederate states. Adams remained in England until May 1868. His last important work was as a member, in 1871–72, of the tribunal at Geneva which settled the "Alabama" claims. He died at Boston, Nov. 21, 1886.

He edited the works of *John Adams* (1850–56), and the *Memoirs of John Quincy Adams* (1874–77). *See* the excellent biography (1900) by his son, Charles Francis Adams, Jr., and E. W. Adams, *Great Britain and the American Civil War* (1925).

**ADAMS, CHARLES FRANCIS** (1886– ), secretary of the navy in President Hoover's cabinet, was born in Quincy, Mass., Aug. 2, 1866, great-grandson of John Quincy Adams, 6th president, and great-great-grandson of John Adams, 2nd president of the United States; A.B., Harvard, 1888; LL.B., 1892; admitted to Suffolk bar 1893. He was a member of Quincy City council, 1893–95; mayor, 1896–97; treasurer of Harvard college, 1898–1929; amateur skipper on yacht "Resolute," which won the International Yacht Races, 1920; appointed secretary of the navy, March 5, 1929. He was a member of the American delegation at the London Naval conference, 1930.

**ADAMS, CHARLES KENDALL** (1835–1902), U.S. educator and historian, was born in Derby, Vt., on Jan. 24, 1835. He graduated in 1861 at the University of Michigan, where he was instructor of history in 1862, assistant professor of history in 1863–67 and professor of history in 1868–85. From 1885 to 1892 he was president of Cornell university, succeeding A. D. White (*q.v.*), and from 1892 to 1902 he was president of the University of Wisconsin. He edited *Representative British Orations* (1884). His published works include *Democracy and Monarchy in France* (1874) and *Christopher Columbus* (1892). He died in Redlands, Calif., on July 26, 1902.

*See* Charles Foster Smith, *Charles Kendall Adams* (1924).

**ADAMS, CLEMENT** (1519?–1587), English author. He is supposed to have been tutor to the royal pages at Greenwich. His *Anglorum Navigatio ad Moscovitas* is an account of the journey to Moscow made by Richard Chancellor and Sir Hugh Willoughby in 1553, and an English translation was printed by Richard Hakluyt in his *Principal Navigations,* vol. i (1598).

**ADAMS, EPHRAIM DOUGLASS** (1865–1930), U.S. educator and historian, brother of Henry Carter Adams (*q.v.*), was born in Decorah, Ia., Dec. 18, 1865. He graduated in 1887 from the University of Michigan from which in 1890 he received the degree of doctor of philosophy. From 1891 to 1899 he was assistant and associate professor of history and sociology, and from 1899 to 1902 professor of European history in the University of Kansas. He was associate professor of history at Stanford university from 1902 to 1906, when he was made professor.

His published writings include *Control of the Purse in the United States Government* (1894), *The Influence of Grenville on Pitt's Foreign Policy* (1904), *British Interests and Activities in Texas* (1910), *The Power of Ideals in United States History* (1913), *Great Britain, America and Democracy* (1919), *Great Britain and the American Civil War* (1925).

**ADAMS, FRANK DAWSON** (1859–1942), Canadian geologist, was born at Montreal, Que., Sept. 17, 1859. He graduated with first rank honours from McGill university, Montreal, in 1878 and took postgraduate work at McGill, Yale and Johns Hopkins university, Baltimore, Md. He received his Ph.D. from Heidelberg in 1892. Adams was appointed lecturer in geology at McGill in 1889 and in 1893 was promoted to the Logan chair of geology. He became dean of engineering in 1908 and vice-principal of the university in 1920, retiring in 1924.

Adams's contribution to pre-Cambrian geology was in determining the true nature of the foliated anorthosites, and in his description of the Grenville and its separation from the pre-Cambrian complex. He investigated the behaviour of rocks under great variations in temperature and pressure, and shed much light on the manner in which internal changes in the structure of the earth were brought about. He died Dec. 29, 1942. (J. J. O'N.)

**ADAMS, GEORGE BURTON** (1851–1925), U.S. educator and historian, was born in Fairfield, Vt., June 3, 1851.

He graduated from Beloit college, Beloit, Wis, in 1873, and received the degree of doctor of philosophy from the University of Leipzig, Germany, in 1886. He was professor of history in Drury college, Springfield, Mo., from 1877 to 1888, when he became professor of history at Yale. From 1895 to 1913 he was editor of the *American Historical Review*. He edited Duruy's *Middle Ages*, Bémont and Monod's *Mediaeval Europe*, and *Select Documents of English Constitutional History*. He died in New Haven, Conn., May 26, 1925.

His published works include *Civilization During the Middle Ages* (1894), *The Growth of the French Nation* (1896), *European History* (1899), *The Origin of the English Constitution* (1912), *Outline Sketch of English Constitutional History* (1918), *The British Empire* (1919) and *The Constitutional History of England* (1921).

ADAMS, HANNAH (1755–1831), American writer, was born in Medfield, Mass., in 1755. She is said to be the first woman in America to have made literature a profession. By private study, which she began at an early age, she acquired much varied learning, including some acquaintance with Latin and Greek. Through family reverses she was compelled from her 17th year to provide for herself. Her writings, though they brought reputation and friends, yielded but little pecuniary profit. Among her chief works were *Views of Religious Opinions* (1784), *History of New England* (1799), *Evidences of Christianity* (1801) and *History of the Jews* (1812). Her *Autobiography*, with additions by Hannah F. Adams, was published in 1832. She died in Brookline, Mass., Nov. 15, 1831.

**ADAMS, HENRY** (1838–1918), American historian, son of Charles Francis Adams and grandson of John Quincy Adams, was born in Boston, Mass, on Feb. 16, 1838. He graduated at Harvard in 1858, studied abroad, and was private secretary to his father when the latter was a congressman and minister to England. Thereafter for a brief time he did political writing in Washington; and from 1870 to 1877 he was assistant professor of history at Harvard, for most of the period also acting as editor of the *North American Review*. He is considered to have been the first to conduct historical seminary work in the United States. His *History of the United States from 1801 to 1817* (9 vols. 1889–91, new ed. 1909) took its place as the best work on the administrations of Presidents Jefferson and Madison, being specially notable for its account of the diplomatic relations of the United States during this period, and for its essential impartiality. This, like his other historical and biographical works such as the *Life of Albert Gallatin* (1879), *John Randolph* (1882), *Historical Essays* (1891), and *Chapters of Erie and Other Essays* (1871, with Charles Francis Adams, Jr.), won him a reputation among scholars. His *Mont Saint-Michel and Chartres* (1913, privately printed 1904) and *The Education of Henry Adams* (1918, privately printed 1906) revealed him to a much wider audience as a writer of delicate sensibilities and refined taste. *Mont Saint Michel and Chartres* is one of the most valuable studies of mediaevalism yet produced in America, not only for the aid which it affords in the appreciation of the literary and architectural monuments of the past, but for the conception which it gives of the animating forces which produced these monuments. The autobiography which attempted to show how ill-adapted eighteenth-century man and education were for the needs of the twentieth century was one of the most widely discussed books of its decade in America. Correlating with these books to a certain extent was Adams's *Letter to American Teachers of History* (1910). He died in Washington on March 27, 1918. Posthumous publications were *The Degradation of the Democratic Dogma* (1919, with an introduction by Brooks Adams) and *Letters to a Niece and Prayer to the Virgin of Chartres* by Henry Adams, with *A Niece's Memories* by Mabel La Farge (1920). After his death he was named by Henry Holt as the author of *Democracy*, an anonymous novel of 1880.

His elder brother, JOHN QUINCY ADAMS (1833–1894), a graduate of Harvard (1853), practised law, and was for several terms a Democratic member of the Massachusetts general court. In 1872 he was nominated for vice president by the Democratic faction that refused to support Horace Greeley.

Another brother, CHARLES FRANCIS ADAMS, JR. (1835–1915), born in Boston, on May 27, 1835, graduated at Harvard in 1856, and was admitted to the bar in 1858. During the Civil War he served on the Union side, receiving, in 1865, the brevet of brigadier general. He was president of the Union Pacific railroad from 1884–90, having previously become widely known as an authority on the management of railways In 1900–01 he was president of the American Historical Association He died in Washington, D C., on March 20, 1915. His autobiography was published in 1916 with a memorial address by Henry Cabot Lodge.

Among his writings are: *Railroads, Their Origin and Problems* (rev. ed. 1887); *Three Episodes of Massachusetts History* (1892); a biography of his father, *Charles Francis Adams* (1900); *Lee at Appomattox and Other Papers* (1902); *Three Phi Beta Kappa Addresses* (1907); *Studies Military and Diplomatic 1775–1865* (1911); and *Atlantic Historical Solidarity* (1913), lectures delivered at Oxford.

Another brother, BROOKS ADAMS (1848–1927), was born in Quincy, Mass., on June 24, 1848, graduated at Harvard in 1870, and until 1881 practised law. He died in Boston, Feb. 13, 1927.

His writings include: *The Emancipation of Massachusetts: The Dream and the Reality* (rev. ed. 1920); *The Law of Civilization and Decay* (1895); *America's Economic Supremacy* (1900); and *The New Empire* (1902).

**ADAMS, HENRY CARTER** (1852–1921), American economist, was born at Davenport, Ia., Dec. 31, 1852. He was educated at Iowa college and Johns Hopkins university, where he was a fellow 1876–78, and in French and German universities. He afterwards taught at Cornell university, and in 1887 became professor of political economy and finance in the University of Michigan. He also became statistician to the Interstate Commerce Committee and was in charge of the transport department in the 1900 census. His principal works include *The State in Relation to Industrial Action* (1887); *Public Debts* (1887); *The Science of Finance* (1888); *Economics and Jurisprudence* (1897); *Description of Industry* (1918) and *American Railway Accounting* (1918). He died Aug. 11, 1921.

**ADAMS, HERBERT** (1858–1945), American sculptor, was born at West Concord (Vt.) on Jan. 28, 1858. He was educated at the Worcester Institute of Technology and at the Massachusetts normal art school, and in 1885–90 he was a pupil of Antonin Mercié in Paris. In 1890–98 he was an instructor in the art school of Pratt institute, Brooklyn, New York. In 1906 he was elected vice-president of the National Academy of Design, New York, and from 1917–20 served as president. He experimented successfully with some polychrome busts and tinted marbles, notably in the "Rabbi's Daughter" and a portrait of Julia Marlowe, the actress. He was at his best in his portrait busts of women, the finest example being the study, completed in 1887, of Miss A. V. Pond, whom he afterwards married. Among his other productions are a fountain for Fitchburg (Mass, 1888); a number of works for the Congressional library, Washington, including the bronze doors ("Writing") begun by Olin Warner, and the statue of Prof. Joseph Henry; memorial tablets for the Boston State House; a memorial of Jonathan Edwards at Northampton (Mass.); statues of Richard Smith, the type-founder, in Philadelphia, and of William Ellery Channing, in Boston (1902); the Vanderbilt memorial bronze doors for St. Bartholomew's church, New York; the group of figures for McMillan fountain in McMillan park, Washington (D.C.); reliefs for tomb of Ellen Axson Wilson (Mrs. Woodrow Wilson). He died May 21, 1945.

**ADAMS, HERBERT BAXTER** (1850–1901), American historian and educationalist, was born at Shutesbury (Mass.) on April 16, 1850. He graduated at Amherst, at the head of his class,

in 1872; and after studying at Göttingen and Berlin he received the degree of Ph D. at Heidelberg in 1876, with the highest honours Thereafter almost until his death he was connected with the Johns Hopkins university, Baltimore (Md.), becoming professor of American and institutional history in 1891. He was one of the founders of the American Historical Association, of which he was secretary until 1900. In 1882 he founded the "Johns Hopkins University Studies in Historical and Political Science," of which he became editor. It was as a teacher, however, that Adams rendered his most valuable services, and many American historical scholars owe their training, and to a considerable extent their enthusiasm, to him. He died at Amherst (Mass ) on July 30, 1901. Among his writings are: *Maryland's Influence in Founding a National Commonwealth* (1877); *Methods of Historical Study* (1884); *Maryland's Influence upon Land Cessions to the United States* (1885); and the *Life and Writings of Jared Sparks* (1893).

**ADAMS, JOHN** (1735–1826), second president of the United States of America, was born Oct. 30, 1735, in what is now the town of Quincy (Mass ). His father, a farmer, also named John, was of the fourth generation in descent from Henry Adams, who emigrated from Devonshire, England, to Massachusetts about 1636; his mother was Susanna Boylston Adams. Young Adams graduated from Harvard college in 1755, and for a time taught in school at Worcester and studied law in the office of Rufus Putnam. In 1758 he was admitted to the bar. From an early age he developed the habit of writing descriptions of events and impressions of men. The earliest of these is his report of the argument of James Otis in the superior court of Massachusetts as to the constitutionality of writs of assistance. This was in 1761, and the argument inspired him with zeal for the cause of the American colonies. Years afterwards, when an old man, Adams undertook to write out at length his recollections of this scene; it is instructive to compare the two accounts. John Adams had none of the qualities of popular leadership which were so marked a characteristic of his second cousin, Samuel Adams; it was rather as a constitutional lawyer that he influenced the course of events. He was impetuous, intense and often vehement, unflinchingly courageous, devoted with his whole soul to the cause he had espoused; but his vanity, his pride of opinion and his inborn contentiousness were serious handicaps to him in his political career. These qualities were particularly manifested at a later period—as, for example, during his term as president. He first made his influence widely felt and became conspicuous as a leader of the Massachusetts Whigs during the discussions with regard to the Stamp Act of 1765. In that year he drafted the instructions which were sent by the town of Braintree to its representatives in the Massachusetts legislature, and which served as a model for other towns in drawing up instructions to their representatives; in Aug. 1765 he contributed anonymously four notable articles to the *Boston Gazette* (republished separately in London in 1768 as *A Dissertation on the Canon and Feudal Law*), in which he argued that the opposition of the colonies to the Stamp Act was a part of the never-ending struggle between individualism and corporate authority; and in Dec. 1765 he delivered a speech before the governor and council in which he pronounced the Stamp Act invalid on the ground that Massachusetts, being without representation in parliament, had not assented to it. In 1768 he removed to Boston. Two years later, with that degree of moral courage which was one of his distinguishing characteristics, as it has been of his descendants, he, aided by Josiah Quincy, Jr., defended the British soldiers who were arrested after the "Boston Massacre," charged with causing the death of four persons, inhabitants of the colony. The trial resulted in an acquittal of the officer who commanded the detachment, and most of the soldiers; but two soldiers were found guilty of manslaughter. These claimed benefit of clergy and were branded in the hand and released. Adams's upright and patriotic conduct in taking the unpopular side in this case met with its just reward in the following year, in the shape of his election to the Massachusetts House of Representatives by a vote of 418 to 118.

BIRTHPLACE OF JOHN ADAMS, SECOND PRESIDENT OF THE UNITED STATES OF AMERICA, AT QUINCY, MASS.

John Adams was a member of the Continental Congress from 1774 to 1778. In June 1775, with a view to promoting the union of the colonies, he seconded the nomination of Washington as commander-in-chief of the army. His influence in congress was great, and almost from the beginning he was impatient for a separation of the colonies from Great Britain On June 7, 1776, he seconded the famous resolution introduced by Richard Henry Lee (*q.v.*) that "these colonies are, and of a right ought to be, free and independent states," and no man championed these resolutions (adopted on July 2) so eloquently and effectively before the congress. On June 8 he was appointed on a committee with Jefferson, Franklin, Livingston and Sherman to draft a Declaration of Independence; and although that document was by the request of the committee written by Thomas Jefferson, it was John Adams who occupied the foremost place in the debate on its adoption Before this question had been disposed of, Adams was placed at the head of the board of war and ordnance, and he also served on many other important committees.

In 1778 John Adams sailed for France to supersede Silas Deane in the American commission there. But just as he embarked that commission concluded the desired treaty of alliance, and soon after his arrival he advised that the number of commissioners be reduced to one. His advice was followed and he returned home in time to be elected a member of the convention which framed the Massachusetts constitution of 1780, still the organic law of that commonwealth. With James Bowdoin and Samuel Adams, he formed a sub-committee which drew up the first draft of that instrument, and most of it probably came from John Adams's pen.

Before this work had been completed he was again sent to Europe, having been chosen, Sept. 27, 1779, as minister plenipotentiary for negotiating a treaty of peace and a treaty of commerce with Great Britain. Conditions were not then favourable for peace, however; the French Government, moreover, did not approve of the choice, inasmuch as Adams was not sufficiently pliant and tractable and was from the first suspicious of Vergennes; and subsequently Benjamin Franklin, Thomas Jefferson, John Jay and Henry Laurens were appointed to co-operate with Adams. Jefferson, however, did not cross the Atlantic, and Laurens took little part in the negotiations. This left the management of the business to the other three. Jay and Adams distrusted the good faith of the French Government. Outvoting Franklin, they decided to break their instructions, which required them to "make the most candid confidential communications on all subjects to the ministers of our generous ally, the king of France; to undertake nothing in the negotiations for peace or truce without their knowledge or concurrence; and ultimately to govern yourself by their advice and opinion"; and, instead, they dealt directly with the British commissioners, without consulting the French ministers. Throughout the negotiations Adams was especially determined that the right of the United States to the fisheries along the British-American coast should be recognized. Political conditions in Great Britain, at the moment made the conclusion of peace almost a necessity with the British ministry, and eventually the American negotiators were able to secure a peculiarly favourable treaty. This preliminary treaty was signed Nov. 30, 1782. Before these negotiations began, Adams had spent some time in the Netherlands. In July 1780 he had been authorized to execute the duties previously assigned to Henry Laurens, and at The Hague was eminently successful, securing there recognition of the United States as an independent government (April 19, 1782), and negotiating both a loan and, in Oct. 1782, a treaty of amity and commerce, the first of such

treaties between the United States and foreign powers after that of Feb. 1778 with France

In 1785 John Adams was appointed the first of a long line of able and distinguished American ministers to the court of St. James's. When he was presented to his former sovereign, George III. intimated that he was aware of Adams's lack of confidence in the French Government. Replying, Adams admitted it, closing with the outspoken sentiment: "I must avow to your Majesty that I have no attachment but to my own country"—a phrase which must have jarred upon the monarch's sensibilities. While in London Adams published a work entitled *A Defence of the Constitutions of Government of the United States* (1787). In this work he ably combated the views of Turgot and other European writers as to the viciousness of the framework of the state governments Unfortunately, in so doing, he used phrases savouring of aristocracy which offended many of his countrymen—as in the sentence in which he suggested that "the rich, the well-born and the able" should be set apart from other men in a senate. Partly for this reason, while Washington had the vote of every elector in the first presidential election of 1789, Adams received only 34 out of 69 As this was the second largest number he was declared vice-president, but he began his eight years in that office (1789–97) with a sense of grievance and of suspicion of many of the leading men. Differences of opinion with regard to the policies to be pursued by the new government gradually led to the formation of two well-defined political groups—the Federalists and the Democratic-Republicans—and Adams became recognized as one of the leaders, second only to Alexander Hamilton, of the Federalists.

In 1796, on the refusal of Washington to accept another election, Adams was chosen president, defeating Thomas Jefferson; though Alexander Hamilton and other Federalists had asked that an equal vote should be cast for Adams and Thomas Pinckney, the other Federalist in the contest, partly in order that Jefferson, who was elected vice president, might be excluded altogether, and partly, it seems, in the hope that Pinckney should in fact receive more votes than Adams, and thus, in accordance with the system then obtaining, be elected president, though he was intended for the second place on the Federalist ticket. Adams's four years as chief magistrate (1797–1801) were marked by a succession of intrigues which embittered all his later life; they were marked, also, by events such as the passage of the Alien and Sedition acts, which brought discredit on the Federalist party. Moreover, factional strife broke out within the party itself; Adams and Hamilton became alienated, and members of Adams's own cabinet virtually looked to Hamilton rather than to the president as their political chief. The United States was, at this time, drawn into the vortex of European complications, and Adams, instead of taking advantage of the militant spirit which was aroused, patriotically devoted himself to securing peace with France, much against the wishes of Hamilton and of Hamilton's adherents in the cabinet. In 1800, Adams was again the Federalist candidate for the presidency, but the distrust of him in his own party, the popular disapproval of the Alien and Sedition acts and the popularity of his opponent, Thomas Jefferson, combined to cause his defeat. He then retired into private life. On July 4, 1826, on the 50th anniversary of the adoption of the Declaration of Independence, he died at Quincy. Jefferson died on the same day. In 1764 Adams had married Abigail Smith (1744–1818), the daughter of a Congregational minister at Weymouth (Mass.). She was a woman of much ability, and her letters, written in an excellent English style, are of great value to students of the period in which she lived. President John Quincy Adams was their eldest son.

**ADAMS, JOHN COUCH** (1819–1892), British astronomer, was born at Lidcot farmhouse, Laneast, Cornwall, on June 5, 1819 He was educated at St. John's College, Cambridge, and was senior wrangler and first Smith's prizeman of his year, 1843. While still an undergraduate he read of certain unexplained irregularities in the motion of the planet Uranus and determined to investigate them, with a view to ascertaining whether they might not be due to the action of a remote undiscovered planet. Elected fellow of his college in 1843, he at once attacked the problem. It was this: from the observed perturbations of a known planet to deduce by calculation, assuming only Newton's law of gravitation, the mass and orbit of an unknown disturbing body. By Sept 1845 he obtained his first solution, and handed to Prof. Challis, the director of the Cambridge Observatory, a paper giving the elements of what he described as "the new planet"

It was not until July 1846 that the search for the new planet was begun at Cambridge. Meanwhile the French astronomer Leverrier had been working along similar lines with equally successful results, and a controversy arose as to whether the discovery of the new planet, Neptune, should be ascribed to the English or the French astronomer. As the facts became known the world recognized that the two astronomers had independently solved the problem of Uranus The new planet, at first called *Leverrier* by F. Arago, received by general consent the neutral name of *Neptune* Its mathematical prediction was an unsurpassed intellectual feat.

In 1851 Adams became president of the Royal Astronomical Society. His lay fellowship at St. John's College came to an end in 1852, but Pembroke College elected him in the following year to a lay fellowship which he held for the rest of his life. In 1858 he became professor of mathematics at St. Andrews, but lectured only for a session, when he vacated the chair for the Lowndean professorship of astronomy and geometry at Cambridge. Two years later he succeeded Challis as director of the Observatory, where he resided until his death.

Although Adams's researches on Neptune were those which attracted widest notice, his subsequent work on gravitational astronomy and terrestrial magnetism was not less remarkable. In 1852 he published new and accurate tables of the moon's parallax, which superseded J. K. Burckhardt's, and supplied corrections to the theories of M. C. T. Damoiseau, G. A. A. Plana and P. G. D. de Pontécoulant. In the following year his memoir on the secular acceleration of the moon's mean motion partially invalidated Laplace's famous explanation, which had held its place unchallenged for 60 years. For these researches the Royal Astronomical Society awarded him its gold medal in 1866. The great meteor shower of 1866 turned his attention to the Leonids, whose probable path and period had already been discussed by Prof. H. A. Newton. Adams ascertained that this cluster of meteors, which belongs to the solar system, traverses an elongated ellipse in 33 years and three months, and is subject to definite perturbations from the larger planets, Jupiter, Saturn and Uranus. These results were published in 1867. Ten years later, when G. W. Hill of Washington expounded a new method for dealing with the problem of the lunar motions, Adams briefly announced his own unpublished work in the same field, which, following a parallel course, had confirmed and supplemented Hill's.

The determination of the constants in Gauss's theory of terrestrial magnetism occupied him at intervals for more than 40 years. The calculations involved great labour, and were not published during his lifetime. They were edited by his brother, Prof. W. Grylls Adams, and appear in the second volume of the collected *Scientific Papers.* Numerical computations of this kind might almost be described as his pastime. The value of the constant known as Euler's, and the Bernoullian numbers up to the 62nd, he worked out to an incredible degree of accuracy. For Newton and his writings he had a boundless admiration; many of his papers, indeed, bear the cast of Newton's thought. He laboured for many years at the task of arranging and cataloguing the great collection of Newton's unpublished mathematical writings, presented in 1872 to the University by Lord Portsmouth, and wrote the account of them issued in a volume by the University Press in 1888.

The post of astronomer-royal was offered him in 1881, but he

preferred to pursue his peaceful course of teaching and research in Cambridge. After a long illness he died at the Cambridge Observatory on Jan. 21, 1892, and was buried in St. Giles's cemetery, near his home.

BIBLIOGRAPHY.—*The Scientific Papers of John Couch Adams*, 4to vol. i. (1896), and vol. ii. (1900), edited by William Grylls Adams and Ralph Allen Sampson with a memoir by Dr. J. W. L. Glaisher, were published by the Cambridge University Press. The first volume contains his previously published writings; the second those left in manuscript, including the substance of his lectures on the Lunar Theory. A collection, virtually complete, of Adams's papers regarding the discovery of Neptune was presented by Mrs. Adams to the library of St. John's College. A description of them by Prof. Sampson was inserted in the *Memoirs* of the Royal Astronomical Society, liv. p. 143).

**ADAMS, JOHN QUINCY** (1767–1848), eldest son of President John Adams, sixth president of the United States, was born on July 11, 1767, in that part of Braintree that is now Quincy (Mass.), and was named after John Quincy (1689–1767), his mother's grandfather, who was for many years a prominent member of the Massachusetts legislature. In 1778 and again in 1780, young Adams accompanied his father to Europe; studying in Paris in 1778–79 and at the University of Leyden in 1780. In 1780, also, he began to keep that diary which forms so conspicuous a record of the doings of himself and his contemporaries. In 1781, at the age of 14, he accompanied Francis Dana (1743–1811), American envoy to Russia, as his private secretary; but Dana was not received by the Russian Government, and in 1782 Adams joined his father at Paris, where he acted as "additional secretary" to the American commissioners in the negotiation of the treaty of peace which concluded the War of Independence Instead of accompanying his father to London, he, of his own choice, returned to Massachusetts, graduated at Harvard college in 1787, three years later was admitted to practice at the bar and at once opened an office in Boston. A series of papers written by him in which he controverted some of Thomas Paine's doctrines in the *Rights of Man*, and later another series in which he ably supported the neutral policy of the Administration toward France and England, led to his appointment by Washington as minister to the Netherlands in May 1794. There was little for him to do at The Hague, but in the absence of a minister at London, he transacted certain public business with the English foreign secretary. In 1796 Washington appointed him minister to Portugal, but before his departure thither his father John Adams became president and changed his destination to Berlin (1797). While there, he negotiated (1799) a treaty of amity and commerce with Prussia. On Thomas Jefferson's election to the presidency in 1800, the elder Adams recalled his son, who returned home in 1801. The next year, he was elected to the Massachusetts senate, and in 1803 was sent to Washington as a member of the Senate of the United States.

Up to this time, John Quincy Adams was regarded as belonging to the Federalist Party, but he now found its general policy displeasing to him, was frowned upon, as the son of his father, by the followers of Alexander Hamilton, and found himself practically powerless as an unpopular member of an unpopular minority. He was not, and indeed never was, a strict party man. On the first important question that came before him in the Senate, the acquisition of Louisiana, he voted with the Republicans, regardless of the opposition of his own section. In Dec. 1807 he warmly seconded Jefferson's suggestion of an embargo and vigorously urged instant action, saying: "The president has recommended the measure on his high responsibility. I would not consider, I would not deliberate; I would act!" Within five hours the Senate had passed the Embargo bill and sent it to the House. The support of a measure so unpopular in New England caused him to be hated by the Federalists there, and cost him his seat in the Senate; his successor was chosen on June 3, 1808, several months before the usual time of filling the vacancy, and five days later Adams resigned. In the same year he attended the Republican congressional caucus which nominated Madison for the presidency, and thus definitely joined the Republicans. From 1806 to 1809 Adams was professor of rhetoric and oratory at Harvard.

In 1809 President Madison sent Adams to Russia to represent the United States. He arrived at St. Petersburg (Leningrad) at the psychological moment when the tsar had made up his mind to break with Napoleon. Adams therefore met with a favourable reception and a disposition to further the interests of American commerce in every possible way. On the outbreak of the war between the United States and England in 1812, he was still at St Petersburg. In September of that year, the Russian Government suggested that the tsar was willing to act as mediator between the two belligerents. Madison precipitately accepted this proposition and sent Albert Gallatin and James Bayard to act as commissioners with Adams; but England would have nothing to do with it. In Aug. 1814, however, these gentlemen, with Henry Clay and Jonathan Russell, began negotiations with English commissioners which resulted in the signature of the Treaty of Ghent on Dec 24 of that year. After this Adams visited Paris, where he witnessed the return of Napoleon from Elba, and then went to London, where, with Henry Clay and Albert Gallatin, he negotiated (1815) a "Convention to Regulate Commerce and Navigation." Soon afterwards he became U S. minister to Great Britain, as his father had been before him, and as his son, Charles Francis Adams, was after him. After accomplishing little in London, he returned to the United States in the summer of 1817 to become secretary of State in the cabinet of President Monroe.

**Later Career.**—As secretary of State, Adams played the leading part in the acquisition of Florida and the promulgation of the Monroe Doctrine. Ever since the acquisition of Louisiana successive administrations had sought to include a part at least of Florida in that purchase. In 1819, after long negotiations, Adams succeeded in bringing the Spanish minister to the point of signing a treaty in which the Spaniards abandoned all claims to territory east of the Mississippi, and the United States relinquished all claim to what is now known as Texas. Before the Spanish Government ratified the treaty in 1820, Mexico, including Texas, had thrown off allegiance to the mother country, and the United States had occupied Florida by force of arms. The Monroe Doctrine (*q.v.*) rightly bears the name of the president who in 1823 assumed the responsibility for its promulgation; but it was primarily the work of John Quincy Adams. The eight years of Monroe's presidency (1817–25) are known as the "Era of Good Feeling." As his second term drew to a close, there was a great lack of good feeling among his official advisers, three of whom—Adams, secretary of State, Calhoun, secretary of War, and Crawford, secretary of the Treasury—aspired to succeed him in his high office. In addition Henry Clay and Andrew Jackson were also candidates. Calhoun was nominated for the vice-presidency. Of the other four, Jackson received 99 electoral votes, Adams 84, Crawford 41, and Clay 37; as no one had a majority, the decision was made by the House of Representatives, which was confined in its choice to the three candidates who had received the largest number of votes. Clay, who was speaker of the House of Representatives, and had for years assumed a censorious attitude toward Jackson, cast his influence for Adams and thereby secured his election on the first ballot. A few days later Adams offered Clay the secretaryship of State, which was accepted. The wholly unjust and baseless charge of "bargain and corruption" followed, and the feud thus created between Adams and Jackson greatly influenced the history of the United States.

Up to this point Adams's career had been almost uniformly successful, but his presidency (1825–29) was in most respects a failure, owing to the virulent opposition of the Jacksonians; in 1828 Jackson was elected president over Adams. It was during his administration that irreconcilable differences developed between the followers of Adams and the followers of Jackson, the former becoming known as the National Republicans, who with the Anti-Masons were the precursors of the Whigs. In 1829 Adams retired to private life in the town of Quincy; but only for a brief period, for in 1830, largely by Anti-Masonic votes, he was elected a member of the national House of Representatives. On its being suggested to him that his acceptance of this position would degrade an ex-president, Adams replied that no person could be degraded by serving the people as a representative in Congress or, he added, as a selectman of his town. His service in Congress from 1831

until his death is, in some respects, the most noteworthy part of his career.

Throughout he was conspicuous as an opponent of the extension of slavery, though he was never technically an abolitionist, and in particular he was the champion in the House of Representatives of the right of petition at a time when, through the influence of the Southern members, this right was, in practice, denied by that body. His prolonged fight for the repeal of the so-called "gag laws" is one of the most dramatic contests in the history of Congress. The agitation for the abolition of slavery, which really began in earnest with the establishment of the *Liberator* by William Lloyd Garrison in 1831, soon led to the sending of innumerable petitions to Congress for the abolition of slavery in the District of Columbia, over which the Federal Government had jurisdiction, and for other action by Congress with respect to that institution. These petitions were generally sent to Adams for presentation. They aroused the anger of the pro-slavery members of Congress, who, in 1836, brought about the passage of the first "gag rule," the Pinckney resolution, presented by Henry L. Pinckney, of South Carolina. It provided that all petitions relating to slavery should be laid on the table without being referred to committee or printed; and, in substance, this resolution was readopted at the beginning of each of the immediately succeeding sessions of Congress, the Patton resolution being adopted in 1837, the Atherton resolution, or "Atherton gag," in 1838, and the Twenty-first rule in 1840 and subsequently until repealed. Adams contended that these "gag rules" were a direct violation of the First amendment to the Federal Constitution, and refused to be silenced on the question, fighting for repeal with indomitable courage, in spite of the bitter denunciation of his opponents. Each year the number of anti-slavery petitions received and presented by him increased; perhaps the climax was in 1837, when Adams presented a petition from 22 slaves, and, when threatened by his opponents with censure, defended himself with remarkable keenness and ability. At each session, also, the majority against him decreased until in 1844 his motion to repeal the Twenty-first rule was carried by a vote of 108 to 80 and his battle was won. On Feb. 21, 1848, after having suffered a previous stroke of apoplexy, he fell insensible on the floor of the Representatives' chamber, and two days later died. Few men in American public life have possessed more intrinsic worth, more independence, more public spirit and more ability than Adams; but throughout his political career he was handicapped by a certain reserve, a certain austerity and coolness of manner, and by his consequent inability to appeal to the imaginations and affections of the people as a whole. He had few intimate friends, and few men in American history have, during their lifetime, been regarded with so much hostility and attacked with so much rancour by their political opponents. Adams was married in 1797 to Louisa Catherine Johnson (1775–1852).

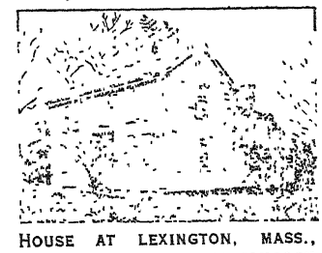
**ADAMS, MAUDE** (1872– ), American actress, was born in Salt Lake City, Utah, on Nov. 11, 1872. The family name was Kiskadden, but she adopted the maiden name, Adams, of her mother, an actress. From an early age she played juvenile parts, and at the age of 16 went to New York. From her appearance in Hoyt's *A Midnight Bell,* in 1889, her popularity grew steadily. In 1897 Charles Frohman gave her her first leading part as Lady Babbie in *The Little Minister;* and in *Peter Pan* she achieved a great success. She introduced Rostand to the American stage, taking the title-rôle in *L'Aiglon* in 1901, and in *Chantecler* in 1911. Other plays in her repertory were *Romeo and Juliet, The Pretty Sister of José, The Jester* and *As You Like It.*

**ADAMS, OSCAR FAY** (1855–1919), American author and editor, was born in Worcester, Mass., in 1855. He was educated in the New Jersey State Normal school. He became a teacher of English literature and a frequent contributor to periodicals. In 1886 he edited *Through the Year with the Poets,* in 12 volumes. His published writings include *The Story of Jane Austen's Life* (1891, 2nd ed. 1897); *The Archbishop's Unguarded Moment and Other Stories* (1899); *A Brief Handbook of English Authors* (1884, 7th ed. 1893); *Dear Old Story Tellers* (1889, new ed. 1911); *A Dictionary of American Authors* (1897, 5th ed. 1905); and *A Motley Jest—Shakespearean Diversions* (1909). He was also American editor for *The Henry Irving Shakespeare.* He died in North Truro, Mass., April 30, 1919.

**ADAMS, ROBERT** (1791–1875), Irish clinician noted for his accounts of essential heart block and rheumatic gout. His name is associated with that of his colleague, William Stokes, in the Stokes-Adams syndrome, a condition of the heart characterized by slowed pulse and giddiness.



See *Biographisches Lexicon,* vol. 1 (1929). (F. L. A.)

**ADAMS, ROGER** (1889– ), U.S. chemist, was born in Boston, Mass., on Jan. 2, 1889. He was educated at Harvard university, from which he graduated in 1909 and received the degree of Ph.D. in 1912. Following two years' study at the University of Berlin and the Kaiser Wilhelm institute, 1912–13, he returned to Harvard, where he was instructor in organic chemistry for three years. In 1916 he was made assistant professor, in 1919 professor and in 1926 head of the department of organic chemistry, in the University of Illinois. He made important researches on catalysts, local anaesthetics, platinum oxide, alkali-insoluble phenols, chaulmoogric acid derivatives and other organic compounds, receiving numerous awards including the Joseph Priestley medal (1946).

His writings include *Organic Syntheses* (1921) and many articles on chemical subjects.

**ADAMS, SAMUEL** (1722–1803), U.S. statesman, born in Boston, Mass., on Sept. 27, 1722, a second cousin to the elder John Adams. He graduated from Harvard college in 1740 and began the study of law. Though he repeatedly failed in business and was sued because of his easy methods as tax collector, he became so influential in local politics as to be called the "Man of the Town Meeting."

He first came into wider prominence at the beginning of the Stamp act episode, when as author of Boston's instructions to its representatives in the general court of Massachusetts he urged strenuous opposition to taxation by act of parliament. At about the same time he was elected to the lower house of the general court, in which he served until 1774, after 1766 as clerk. As James Otis's vigour and influence declined, Adams took a more prominent position in the revolutionary councils, in which he advised against any form of compromise. Many of the Massachusetts revolutionary documents, including the famous "Massachusetts Resolves" and the circular letter to the legislatures of the other colonies, are from his pen. Indeed, there can be no question that he was one of the first American political leaders to deny the legislative power of parliament and to desire and advocate separation from the mother country.

HOUSE AT LEXINGTON, MASS., FROM WHICH ADAMS AND HANCOCK ESCAPED WHEN AROUSED BY PAUL REVERE

To promote the ends he had in view Adams suggested non-importation instituted the Boston committees of correspondence, [illegible] a Continental Congress be called, and wrote a vast number of articles for the newspapers, especially the Boston *Gazette,* over a multitude of signatures. He was, in fact, one of the most voluminous and influential political writers of his time. His style is clear, vigorous and epigrammatic; his arguments are characterized by strength of logic and appeals to passion, and are based not so much on precedent and documentary authority as on "natural right."

Although he lacked oratorical fluency, his short speeches, like his writings, were forceful; and he was an eminently successful manager of men, shrewd, wily, adroit, an adept in all the arts of the politician. He is considered to have done more than any other

one man, in the years immediately preceding the War of Independence, to mould and direct public opinion in his community; and by his contemporaries he was credited with equally successful management of the delegates to the first Continental Congress.

During the intense excitement which followed the "Boston Massacre," Adams skilfully secured the removal of the soldiers from the town to a fort in the harbour. He also managed the proceedings of the "Boston Tea Party," and later he was leader in the opposition to the Boston Port bill. One of the objects of the expedition sent by the governor, Gen. Thomas Gage, to Lexington, Mass., (*q.v.*) and Concord, N.H., on April 18–19, 1775, was the capture of Adams and John Hancock, temporarily staying in Lexington, and when Gage issued his proclamation of pardon on June 12 he excepted these two, whose offenses, he said, were "of too flagitious a nature to admit of any other consideration than that of condign punishment."

As a delegate to the Continental Congress, from 1774 to 1781, Adams vigorously opposed any concession to the British government, strove for harmony among the several colonies in the common cause, served on the committee to prepare a plan of confederation and signed the Declaration of Independence. His most important service was in organizing the forces of revolution before 1775.

In 1779 he was a member of the convention which framed the constitution of Massachusetts adopted in 1780, and in 1788 a member of the Massachusetts convention to ratify the constitution of the United States. From 1789 to 1794 Adams was lieutenant governor of his state, and from 1794 to 1797 governor. After the formation of parties he became allied with the Democratic-Republicans rather than with the Federalists. He died in Boston on Oct. 2, 1803.

C. Tyler, *Literary History of the American Revolution,* 2 vols. (1897); H. A. Cushing (ed.), *The Writings of Samuel Adams,* 4 vols (1904–08); and "Warren-Adams Letters," 2 vols., Mass. Hist. Soc., *Collections* (1917–25). (E. C.)

**ADAMS, SAMUEL HOPKINS** (1871– ), U.S. author, was born in Dunkirk, N.Y., on Jan. 26, 1871. He graduated from Hamilton college, Clinton, N.Y., in 1891 and entered journalism. From 1891 to 1900 he was engaged as a reporter and special writer for the *New York Sun.* He was managing editor of McClure's syndicate in 1900–01, advertising manager of McClure, Phillips and Company in 1901–02, and from 1903 to 1905 member of the editorial staff of *McClure's Magazine.*

In 1905 he contributed to *Collier's Weekly* a noteworthy series of articles exposing fraudulent quack medicines, and in 1915–16, in the *New York Tribune,* he similarly exposed dishonourable practices in advertising.

Among his published writings are: *The Mystery,* with Stewart Edward White (1905); *The Great American Fraud* (1906); *The Flying Death* (1906); *Average Jones* (1911); *The Secret of Lonesome Cove* (1913); *The Health Master* (1913); *The Clarion* (1914); *Little Miss Grouch* (1915); *The Unspeakable Perk* (1916); *Our Square and the People in It* (1917); *Common Cause* (1918), *Wanted, a Husband* (1919); *Revelry* (1926); *The Gorgeous Hussy* (1934); *Maiden Effort* (1937); and *A. Woollcott: His Life and His Works* (1946).

**ADAMS, SARAH FLOWER** (1805–1848), English poet, was born at Great Harlow, Essex, Feb. 22, 1805. She was the daughter of Benjamin Flower and in 1834 married William Bridges Adams, inventor and pamphleteer. She was a Unitarian and her writings are chiefly religious. Her longest work, *Vivia Perpetua* (1841), a dramatic poem having for its subject the life of the early Christians, contains impressive passages. Besides various other poems, she wrote several beautiful hymns, the best known of which is "Nearer, My God, to Thee" (1840). She died in Aug. 1848.

**ADAMS, WALTER SYDNEY** (1876– ), U.S. astronomer, was born in Antioch, northern Syria, on Dec. 20, 1876. He graduated from Dartmouth college, Hanover, N.H., in 1898, studied at The University of Chicago in 1899–1900 and at the University of Munich in 1901. For the ensuing three years he was an assistant and instructor in the Yerkes observatory at Lake Geneva, Wis. He was assistant astronomer at the Mt. Wilson observatory of the Carnegie institution, Pasadena, Calif., from 1904 to 1909, when he was made astronomer. He served also as acting or assistant director of the observatory from 1910 until 1923, and then as director from 1923 to 1946. His writings include a memoir on the rotation of the sun and papers on stellar motions, solar and stellar spectroscopy.

In 1935 he received the Janssen medal of the Paris Academy of Sciences.

**ADAMS, WILLIAM** (d. 1620), English navigator, the first Englishman in Japan, was born at Gillingham, near Chatham, England. When 12 years old he was apprenticed in the mercantile marine, afterward entering the British navy, and later serving the company of Barbary merchants as master and pilot. Attracted by the Dutch trade with India, he shipped as pilot major with a little fleet of five ships dispatched from the Texel in 1598 by a company of Rotterdam merchants. The vessels, boats ranging from 75 to 250 tons and crowded with men, were driven to the coast of Guinea, where the adventurers attacked the island of Annabon for supplies, and finally reached the straits of Magellan. Scattered by stress of weather the following spring, the "Charity," with Adams on board, and the "Hope" met at length off the coast of Chile, where the captains of both vessels lost their lives in an encounter with the Indians. In fear of the Spaniards, the remaining crews determined to sail across the Pacific. On this voyage the "Hope" was lost, but in April 1600 the "Charity," with a crew of sick and dying men, was brought to anchor off the island of Kiushiu, Japan.

Adams was summoned to Osaka and there examined by Iyeyasu, the guardian of the young son of Taiko Sama, the ruler, who had just died. His knowledge of ships and shipbuilding, and his nautical smattering of mathematics, raised him in the estimation of the shogun, and he was presented with an estate at Hémi near Yokosuka; but was refused permission to return to England. In 1611 news came to him of an English settlement in Bantam, and he wrote asking for help. In 1613 Capt. John Saris arrived at Hirado in the ship "Clove" with the object of establishing a trading factory for the East India company, and after obtaining the necessary concessions from the shogun, Adams postponed his voyage home (permission for which had now been given him) in order to take a leading part, under Richard Cocks, in the organization of this new English settlement.

He had already married a Japanese woman, by whom he had a family, and the latter part of his life was spent in the service of the English trading company, for which he undertook a number of voyages to Siam in 1616, and Cochin-China in 1617 and 1618. He died May 16, 1620, some three years before the dissolution of the English factory. His Japanese title was Anjin Sama, and his memory was preserved in the naming of a street in Yedo, Anjin Cho (Pilot street), and by an annual celebration on June 15 in his honour.

**ADAMS, WILLIAM TAYLOR** (1822–1897), U.S. juvenile writer, popularly known under the pseudonym of "Oliver Optic," was born in Medway, Mass., on July 30, 1822. For 20 years he was a teacher in the public schools of Boston, and he served for a term in the state legislature. He wrote more than 100 books, chiefly juvenile fiction, which appeared in several series. In large part these were contributed to *Oliver Optic's*

*Magazine,* of which he was founder and editor. Among the best known are "Boat Club" series (1854), "Riverdale Story Books" (1858), "Woodville Stories" (1863–67), "Army and Navy" series (1865–1894), "Starry Flag" series (1867–69), "Young America Abroad" series (1867–69), "Great Western" series (1875–82), "Yacht Club" series (1900–03). He wrote also two novels, *The Way of the World* (1867) and *Living Too Fast* (1876). He died in Boston on March 27, 1897.

**ADAMS,** a town of Berkshire county, Mass., U.S., near the northwest corner of the state, including part of the valley of the Hoosac river, and extending from the Hoosac mountains on the east to Mt. Williams (3,040 ft.) and Mt. Greylock (3,491 ft.) on the west. Area 23 sq mi.; pop. (1950) 12,027; (1940) 12,608, of whom 2,480 were foreign-born whites Adams is on a branch of the Boston and Albany railroad, and is the nearest railway station for an ascent of Mt. Greylock It is an industrial centre, with textile printing, cotton mills, paper mills and lime quarries. The town (originally East Hoosuck) was surveyed in 1749 and incorporated in 1778. It was named after Samuel Adams, the revolutionary leader. North Adams was made a separate township in 1895.

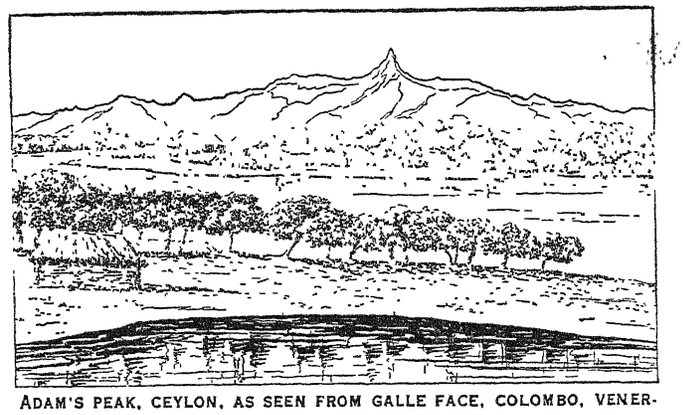
**ADAM'S APPLE,** the prominence in the middle of the front of the neck which moves up and down with swallowing. It is more noticeable in men than in women. It is formed by the thyroid cartilage of the larynx, which is commonly known as the voice box. It is sensitive to pressure and blows and is vulnerable to attack in systems of personal combat.

**ADAM'S BRIDGE** or **RAMA'S BRIDGE,** a chain of sandbanks between the Island of Manaar, near the north-west coast of Ceylon and the Island of Rameswaram, off the Indian coast, and lying between the Gulf of Manaar on the south-west and Palk Strait on the north-east. More than 30m. long, it seriously hinders navigation. Some of the sandbanks are dry, and no part of the shoal has a greater depth than 3ft. or 4ft. at high water. Though dredging operations were begun as early as 1838 they never succeeded in maintaining a channel for any save vessels of light draught and have now been abandoned. Geological evidence shows that this gap was once bridged by a continuous isthmus, which, according to temple records, was breached by storm in 1480. These banks and shoals are traditionally supposed to be the remains of a huge causeway constructed by Rama, the hero of the *Ramayana,* to facilitate passage of his army from India to Ceylon for the rescue of his abducted wife Sita.

**ADAM SCOTUS** (*c.* 1180), theological writer, sometimes called Adam Anglicus or Anglo-Scotus, was born in the south of Scotland in the first half of the 12th century. About 1150 he was a Premonstratensian canon at St. Andrews, and about 20 years later was perhaps abbot and bishop of Candida Casa (Whithorn) in Galloway. He gained a European reputation for his writings, which are of mystico-ascetic type, and include an account of the Premonstratensian order, a collection of festival sermons, and a *Soliloquia de instructione discipuli,* formerly attributed to his contemporary, Adam of St. Victor.

**ADAMSEN, AMANDUS HEINRICH** (1855–1929), Estonian sculptor, studied in St. Petersburg (Leningrad). In 1887 he produced a portrait in relief of Tsar Alexander III.; he then went to Paris, where he lived for several years. In 1891 he returned to his native land and lived alternately in Port Baltic and St. Petersburg.

Adamsen's technique in marble and wood was moulded on classical lines. His small wood carvings are incomparable. His most important works are an allegory, shown at the Paris Exhibition in 1889, entitled "Liebe, Tod und Wissenschaft"; "Die Welle," and "Hunger"; also "Befreiter Genius" and "Sieg der Arbeit," which were executed for the Nijni-Novgorod Exhibition.



**ADAMSON, PATRICK** (1537–92), Scottish divine, Archbishop of St. Andrews, was born at Perth and educated at St. Andrews. He then spent some years in Paris, and was in hiding for seven months after the massacre of St. Bartholomew. He returned to Scotland in 1572, and in 1576 was appointed Archbishop of St. Andrews. He came into acute conflict with the General Assembly, and was twice excommunicated, though in each case the sentence was remitted. The last years of his life were spent in poverty His collected works, which include Latin verse translations of the books of Job and Revelation, were printed in 1614.

**ADAMSON, ROBERT** (1852–1902), Scottish philosopher, was born in Edinburgh on Jan. 19, 1852. After a distinguished career at Edinburgh university he spent some time at Heidelberg (1871), where he began his study of German philosophy. He then returned to Edinburgh as assistant, first to Henry Calderwood and later to A. Campbell Fraser; he joined the staff of the *Encyclopædia Britannica* (9th ed) (1874). In 1876 he succeeded W S. Jevons in the chair of logic and philosophy at Owens college, Manchester. In 1893 he went to Aberdeen, and finally, in 1895, to the chair of logic at Glasgow, which he held till his death on Feb 5, 1902. At Glasgow university he accomplished a great deal of useful administrative work and left a substantial impress on its constitution.

In 1903, under the title *The Development of Modern Philosophy and Other Essays,* his more important lectures were published with a short biographical introduction by Prof. W. R. Sorley of Cambridge university (see *Mind,* xiii. p. 73 *seq*) (1904). Most of the matter is taken verbatim from the notebook of one of his students. Under the same editorship there appeared, three years later, his *Development of Greek Philosophy.*

Throughout his lectures Adamson pursued the critical and historical method without formulating a constructive theory of his own. He felt that any philosophical advance must be based on the Kantian methods. As he grew older his metaphysical optimism waned. He felt that the increase of knowledge must come in the domains of physical science. Adamson represented an empiricism which, so far from refuting, was actually based on, idealism, and yet was alert to expose the fallacies of a particular idealist construction (*see* his essay in *Ethical Democracy,* edited by Dr. Stanton Coit).

**ADAM'S PEAK,** a mountain in Ceylon, about 45 mi E of Colombo, in 6° 55′ N., 80° 30′ E. It rises steeply to a height of 7,360 ft and commands a magnificent prospect. Its conical summit terminates in an oblong platform, 74 ft. by 24, on which there is a hollow, resembling the form of a human foot, 5 ft. 4 in. by 2 ft. 6 in. It is held in veneration by Buddhists, Mohammedans and Hindus alike, and by them is respectively ascribed to Gautama, to

ADAM'S PEAK, CEYLON, AS SEEN FROM GALLE FACE, COLOMBO, VENERATED BY THE SINHALESE. PILGRIMS ASCEND TO THE SACRED SPOT

Adam and to Siva It is in charge of Buddhist monks, and is the resort of large numbers of pilgrims At dawn the peak frequently casts a very well-defined shadow upon the clouds. It can be reached from Hatton on the railway or from Ratnapura.

**ADANA.** (1) A vilayet in S.E. Asia Minor, Turkey, including the ancient Cilicia. Pop. (1950) 509,600. Land area, 6,663 sq.mi. The mountain districts are rich in unexploited mineral wealth, and the fertile coast-plain, watered by streams from the Taurus, produces cotton, rice, cereals, sugar and much fruit, and affords abundant pasturage Imports and exports pass through Mersina (*q.v.*). (2) The chief town of the vilayet, in the alluvial plain about 30 mi. from the sea in 37° 1′ N., 35° 18′ E., on the right bank of the Seihan (Sihun, anc Sarus), navigable by small craft as far as the town. Adana is connected with Tarsus and Mersina

by a railway built in 1887, and has a magnificent stone bridge, carrying the road to Missis and the east, and dating in parts from the time of Justinian, but restored first in A.D. 743 and called Jisr al-Walid after the Omayyad caliph of that name, and again in 840 by Caliph Mutasim. There are, also, a ruined castle founded by Harun al-Rashid in 782, fine fountains, good buildings, river-side quays and cotton mills. Adana was a station on the Roman military road to the east and was largely rebuilt by Mansur in 758. Its position, commanding the passage of the mountains to the north of Syria, led to many vicissitudes. In the contest between Egyptians and Turks in 1832, after the defeat of the Turkish army at Konia, it was granted to Ibrahim Pasha, and though the firman named him only *muhassil,* or collector of the crown revenue, it continued to be held by the Egyptians till the treaty of July 1840 restored it to the Porte. The chief [illegible] of the province are cotton, corn, sesame and wool, [illegible] Pop. (1950) 117,799. The vilayet and city have been [illegible]

**ADANSON, MICHEL** (1727–1806), French naturalist of Scottish descent, was born at Aix-en-Provence. He travelled in Senegal and published an *Histoire naturelle du Sénégal* (Paris, 1757). Adanson's chief work was done as a botanist. In his *Familles naturelles des plantes* (1763) he opened the way for the natural classification of plants developed later by A. L de Jussieu in his *Genera Plantarum* (1780). He also left a vast unfinished encyclopaedia on all known beings and substances, which has never been published

**ADAPA, MYTH OF.** Adapa was a legendary sage, a citizen of Eridu, a city of Babylonia. Endowed with vast intelligence by the God Ea, he became the hero of the Eridu myth of the Fall of Man. Adapa, in spite of his possession of all wisdom was denied immortality; and one day, while fishing, the south wind blew so violently that he was thrown into the sea. In his rage he broke the wings of the south wind which then ceased to blow. Anu, the god of heaven, summoned him before his gates to receive punishment, but jealous Ea (god of wisdom) cautioned him not to touch the bread and water which would be offered him. When Adapa came before Anu, Tammuz and Gishzida interceded for him and explained to the god of heaven that as Adapa had been endowed with omniscience he needed only immortality to become a god; Anu then offered Adapa the bread and water of eternal life, which he refused to take. Thus mankind became mortal. (See *The Cambridge Ancient History,* vol. i [1924].)

**ADAPTATION,** a process of fitting, or modifying, a thing to other uses and so altering its form or original purpose. In literature there may be; *e.g.,* an adaptation of a novel for a drama, or in music an arrangement of a piece for two hands into one for four, etc. In biology, adaptation plays a prominent part as the process by which an organism or species becomes modified to suit the conditions of its life. Every change in a living organism involves adaptation; for in all cases life consists in a continuous adjustment of internal to external relations. Some adaptations are produced afresh in each generation, others are transmitted by heredity, having been probably fixed by natural selection. (*See* EVOLUTION, ORGANIC; SELECTION; VARIATION.)

**ADDA** (anc. *Addua*), a river of north Italy. It rises in small lakes of the Fraele glen and unites with several smaller streams near Bormio, in the Rhaetian Alps. Thence it flows southwest and west through the fertile Valtellina (*q.v.*) passing Tirano; the Poschiavino joins it at Tirano and the Malero at Sondrio. It falls into the northern end of the Lake of Como. On issuing from the southeast or Lecco arm, it crosses the plain of Lombardy, and, after about 150 mi., joins the Po 8 mi. above Cremona. The lower Adda once bounded the territories of Venice and Milan. At Trezzo, 20 mi. N.E. of Milan, there is a hydroelectric power plant.

**ADDAMS, JANE** (1860–1935), U.S. social reformer, was born at Cedarville, Ill., Sept. 6, 1860. After graduating from Rockford college, Rockford, Ill. (A.B., 1882), she entered the Woman's Medical college of Philadelphia, Pa., but her health failed, and after two years of invalidism she travelled extensively in Europe, where she visited Toynbee hall, London, Eng. After her return she founded Hull house, a pioneer social settlement in the old Hull mansion on Chicago's west side, where well-known social reformers lived as residents. In this large settlement she worked with labour and other reform groups for many pioneer welfare laws such as the first juvenile court law and the first "mother's pension" law, tenement house regulation, an eight-hour law for women, factory inspection and workmen's compensation. She was also an able supporter of woman suffrage. A well-known pacifist, she was chairman of the International Congress of Women at The Hague, Neth., in 1915, following which the Women's International League for Peace and Freedom, of which she became president, was established. She was cowinner of the Nobel peace prize in 1931 She was the first woman president of the National Conference of Social Work (1910) and took an active part in the Progressive campaign with Theodore Roosevelt in 1912. Author of many books and articles, she used her influence for social justice for the immigrant, for the Negro, for labour and for the rights of women and children She died in Chicago on May 21, 1935. (E. AT.)

**ADDAX,** a genus of antelopes, with one species (*A. nasomaculatus*) from North Africa and Arabia. It is 3 ft high, yellowish white in colour, with a brown mane and fringe on the throat. Both sexes carry horns, which are ringed and form an open spiral. The addax is a desert antelope, living in regions where it seldom rains and getting its necessary moisture from the desert plants.

**ADDER,** a name for the common viper (*Vipera berus*) of Europe and Asia. The puff-adder (*Bitis arietans*), widespread in Africa, and the death-adder (*Acanthophis antarcticus*), of Australia, are very poisonous. In North America the original meaning of "any snake" tends to be preserved, as for the harmless hognose snake (*Heterodon contortrix*), which hisses loudly and is called the puffing adder or spreading adder. *See* HOGNOSE; VIPER.

ADDING MACHINE: *see* OFFICE APPLIANCES.

**ADDIS ABABA** (the new flower), capital of Ethiopia since 1896, about 8,000 ft above sea level on the southern slopes of the Entoto Mts. in 9° 1′ N., 38° 56′ E. It is the centre of trade and is linked by a single railway line (486.5 mi.) with Jibuti in French Somaliland on the Gulf of Aden and by roads, built for the most part by the Italians, to Asmara, Assab, Jimma, etc. After the completion of the railway in 1918 Addis Ababa underwent much change. It is embowered in woods of eucalyptus planted by Emperor Menelek and is watered by small tributaries of the Awash river, notably the Akaki and the Kabana. The normal population is about 150,000, but at feast times thousands of followers of the chiefs and provincial governors attend court. The foreign legations are quartered in well built houses in large grounds on the outskirts of the town. After the visit of Emperor Haile Selassie to Europe in 1924 motor cars were imported into the town. The central market place is the daily rendezvous of immense numbers of peasants and traders dealing in local and imported cotton and other goods. The city suffered somewhat from bombs dropped during the Italian war on Ethiopia in 1935–36. Numerous buildings, including government offices and hospitals, were erected during the Italian occupation. The Ethiopian government has embarked on a program of modernization for the city. Electric and water facilities exist. Radio and telephone communications are to be extended, as are commercial air routes. Most of the few industries of Ethiopia are in or near the city: flour mills, cotton processing plants, ice, carbonated water and beer plants, machine shops, etc. The city was captured by the Italians, May 5, 1936, and soon after became the capital of Italian East Africa. It was taken by British and Ethiopian troops, April 5, 1941. The emperor returned May 5, 1941. (P. W. I.)

**ADDISON, JOSEPH** (1672–1719), English essayist, poet and man of letters, eldest son of Lancelot Addison, later Dean of Lichfield, was born at his father's rectory of Milston in Wiltshire, on May 1, 1672. After having attended several schools, the last Charterhouse, he was entered a commoner of Queen's college, Oxford, at the age of 15; but after two years was elected to a demyship of Magdalen college for his skill in Latin versification. He took his master's degree in 1693 and subsequently obtained a fellowship which he held until 1711. Much of his early Latin verse is preserved in the *Musae Anglicanae* (1691–99). A

poem in the third volume of Dryden's *Miscellanies* followed in the next series by a translation of the fourth *Georgic*, brought about his introduction to Tonson the bookseller, and (probably through Tonson) to Lord Somers and Charles Montagu. To both of these persons he commended himself by *An Account of the Greatest English Poets* (1694), *An Address to King William* (1695), after Namur, and a Latin poem entitled *Pax Gulielmi* (1697), on the Peace of Ryswick, with the result that in 1699 he obtained a pension of £300 a year to enable him (as he afterwards said in a memorial addressed to the Crown) "to travel and qualify himself to serve his Majesty." In the summer of 1699 he crossed into France, where, chiefly for the purpose of learning the language, he remained till the end of 1700; and after that he spent a year in Italy. In Switzerland, on his way home, he was stopped by receiving notice that he was to attend the army under Prince Eugene, then engaged in the war in Italy, as secretary from the King. But in March 1702 the death of King William at once drove his Whig friends from power and Addison's pension ceased He was able, however, to visit a great part of Germany, and did not reach Holland till the spring of 1703. In the autumn of the same year Addison returned to England.

AFTER THE STATUE IN WEST MINSTER ABBEY

ADDISON WHO, WITH STEELE, DELIGHTED THE TOWN WITH THE "SPECTATOR"

During his residence abroad he wrote the rhymed *Letter from Italy* to Charles Montagu, the *Dialogues on the Usefulness of Medals,* not published until after his death, and the *Remarks on several parts of Italy,* printed in 1705. After his return to England he was asked by Lord Halifax to write a poem celebrating Marlborough's victory at Blenheim. This, *The Campaign* (1704), won for its author a post in the excise, which was practically a sinecure. The next ten years of his life were spent in government service as an under-secretary of State, secretary to Lord Halifax on a mission to the Elector of Hanover (1708), and secretary to Lord Wharton, the lord lieutenant of Ireland (1708–10). His commissionership in the excise he retained all his life, and he sat in Parliament, a silent member, from 1708 onwards, first for Lostwithiel and then for Malmesbury. During this period he wrote an anonymous pamphlet in defence of the Government entitled *The Present State of the War* (1707), and an opera libretto, *Rosamond,* complimenting the Duke of Marlborough, which was a failure at the time, but was afterwards set to music by Dr. Arne with great success. In 1711 he purchased for £10,000 the estate of Bilton near Rugby.

Soon after the fall of the ministry, he started the *Whig Examiner* in opposition to the Tory *Examiner,* then conducted by Prior, and afterwards the vehicle of Swift's most vehement invectives against the party to which he had once belonged These are certainly the most ill-natured of Addison's writings; but they are neither lively nor vigorous, and the paper died after five numbers (Sept. 14 to Oct. 12 1710). There is more spirit in his allegorical pamphlet, *The Trial and Conviction of Count Tariff.* But meanwhile Addison found his real vocation as one of the greatest of English essayists. Richard Steele, who had been Addison's schoolfellow at the Charterhouse, remained on intimate terms with him and belonged to the same political party. Addison was in Dublin when, in April 1709, Steele published the first number of the "Tatler." He is said to have detected his friend's authorship only by recognizing in the sixth number a critical remark on Virgil, which he remembered having himself communicated to Steele. He began to furnish hints and suggestions, assisted occasionally and finally wrote regularly. According to Aitken (*Life of Steele,* i. 248), he contributed 42 out of the total of 271 numbers, and was part-author of 36 more. With the advent of Addison as a contributor the character of the "Tatler" changed. The essay began to preponderate, and the news element almost disappeared. The paper was discontinued from Jan. 2, 1711, perhaps because its semi-political character made Steele's position difficult under the Tory administration. But after a very short time it had a successor in the "Spectator," in which Addison played the leading part The paper was to be non-political, and was to "bring philosophy out of the closets and libraries, schools and colleges, to dwell in clubs and assemblies; at tea-tables and in coffee-houses" (*Spectator* No. 10).

**The first number** appeared on March 1, 1711; the paper was issued daily until Dec. 6, 1712. In the "Tatler" the papers on different subjects had been dated from various clubs; in the "Spectator" the framework is supplied by an imaginary club grouped round the "Spectator" Mr. Spectator himself, whose character is portrayed in the first number, represents a new and more sober England, very different from the court circles of the time. He is learned, thoughtful, serious, yet with a pleasant humour; he frequents the coffee-houses, and his observant eye notes the new spirit growing up under the older forms of society. His fellow club members represent different types. Sir Roger de Coverley is the old English country gentleman; Sir Andrew Free port represents the great London merchant class; Captain Sentry is the good-humoured soldier discharged in civil life, Will Honeycomb the man of fashion, while the Templar stands for learning and wit, and so on

For nearly two years the "Spectator" delighted the town. The "Spectator" stood for reason and moderation in an age of bitter party strife, for clean living in an age when the English upper classes had not yet recovered from the licence of the Restoration, and in criticism for the best standards of its time. Addison and Steele were for a reconciliation of the harsh austerities of Puritanism with the careless profligacy of the Restoration. They were, in fact, great moralists Samuel Johnson, whose political sympathies did not make him too friendly to Addison, paid his tribute to the lucidity and purity of his English style. "Whoever wishes to attain an English style," he said, "must give his days and nights to the volumes of Addison" And Macaulay speaks justly of Addison as the "consummate painter of life and manners," and of "the great satirist who alone knew how to use ridicule without abusing it; who, without inflicting a wound, effected a great social reform, and who reconciled wit and virtue, after a long and disastrous separation, during which wit had been led astray by profligacy and virtue by fanaticism." The "Spectator" includes the famous Saturday papers on Milton in which Addison applied the principles of Aristotelian criticism to Milton's work. However excessive his praise of Milton may seem (he placed him above Homer and Virgil), these papers had a great influence on criticism for a long period, and were translated into French and German.

Of the 555 papers in the "Spectator" Addison's numbered 274 against 236 written by Steele. W. J. Courthope estimated the circulation of the "Spectator" at 10,000—a very large number for those days—and the bound annual volumes had a further sale of 9,000. After the "Spectator," Steele projected the "Guardian," which was also to be non-political, but did not maintain its aloofness. Addison also contributed a few papers.

It is astonishing to some readers that Addison's tragedy of *Cato,* produced on April 13, 1713, should have been counted one of his best achievements. But the artificiality and frigidity of the piece, and its glaring faults even after the emendations of Pope and others, counted for very little against the political interest imported into the play. It was dedicated to the Duchess of Marlborough, and the liberal sentiments put into the mouths of Roman orators were taken as a glorification of Whig sentiments. It was interpreted as a defence of the Whigs and Marlborough against the Tories, who were suspected of trying to undo the Act of Settlement. *Cato* ran for 35 nights. It was translated into French and German, and Addison was praised by Voltaire as "the first Englishman who composed a regular tragedy and infused a spirit of elegance into every part of it." Voltaire's praise was partly due to Addison's strict adherence to the unity of place which his English contemporaries found unnatural and artificial.

From the cessation of the "Spectator" onwards, Addison's life, though outwardly increasingly prosperous, was clouded by various misunderstandings and quarrels. The rights and wrongs of Pope's quarrel with him (*see* POPE, ALEXANDER) are difficult to disentangle, and cannot be dealt with here. But Addison, who had established Button in a coffee-house in Covent Garden, held a little literary court there of which Budgell, Tickell, Carey and Phillips were members. Pope was not a member of the coterie, though it appears that he made a brief appearance there. In any case there was a complete breach. Pope wrote the famous lines on Atticus in the *Epistle to Dr. Arbuthnot* in which Addison is mercilessly attacked as "willing to wound, and yet afraid to strike," who "like Cato, gives his little senate laws, and sits attentive to his own applause." The *Epistle* was not published until after Addison's death, though he must have seen the lines.

On the accession of George I., Addison was appointed secretary to the lords justices entrusted provisionally with the conduct of the Government until the new King's arrival. He then became once more chief secretary for Ireland. He defended the Hanoverian succession against the Jacobite partisans in a new paper called the "Freeholder" which appeared bi-weekly between Dec. 23, 1715 and June 9, 1716. Probably in return for this service he was made one of the commissioners for trade and the colonies. In Aug. 1716 he married Charlotte, Countess dowager of Warwick, who brought her husband the occupancy of Holland House, Kensington. The common report that the marriage was a very unhappy one is based mainly on the evidence of Addison's enemies. The allegations that he was incompetent in the public service are derived from similar sources; but as one of the secretaries of State in the Sunderland cabinet (1717) he seems to have been a failure. He resigned on the plea of failing health in March 1718. In the same month he found himself ranged as a pamphleteer against his old friend Dick Steele. The contest was still proceeding when Addison died of dropsy, June 17, 1719. Steele's real love for his friend was shown in the letter to Congreve prefixed to Addison's anonymous comedy *The Drummer,* acted in 1716.

Addison's life was written in 1843 by Lucy Aikin. This was reviewed by Macaulay in July of the same year. A more modern study is that in the "Men of Letters" series by W. J. Courthope (1884). The *Spectator* (seven vols. 1712–13, the 8th being added in 1715), was frequently reprinted. There is a good modern edition, in eight vols. (1897–98) by G. Gregory Smith. Of the *Tatler* there is an edition by G. A. Aitken in eight vols. (1898). A complete edition of Addison's works (based upon Hurd) is included in Bohn's *British Classics;* Bonamy Dobree, *Essays in Biography* (1925).

**ADDISON'S DISEASE,** a morbid state first described by Thomas Addison in 1855, has as prominent features of its syndrome asthenia, marked weakness, low blood pressure, loss of weight, irritability of the gastrointestinal tract and, usually, pigmentation. The cause of the symptoms is deficiency of adrenal cortical function, but there is more than one reason for failure of the cortical tissue.

The most common lesion is caseation associated with tuberculosis. Atrophy of the gland without infection is found in 20% or more of the cases.

Life in the presence of Addison's disease has been difficult and precarious. Any condition which resulted in loss of sodium and chloride, as excessive perspiration or a diet with high content of potassium and low sodium, could cause prostration or death. Physical exertion, strain from a surgical operation or administration of an anaesthetic alone, has been sufficient to precipitate a critical condition.

Diagnosis of Addison's disease in its severe form is not difficult, but demonstration of limitation of adrenal cortical function requires objective laboratory tests. Under closely controlled conditions, determination of the ability of the kidney to retain sodium and chloride or to excrete water furnishes reliable information concerning adrenal cortical activity. Patients with Addison's disease have survived without adequate treatment for months or a few years, but before recognition of the relation of sodium potassium and chloride to the severity of the symptoms a fatal termination was almost certain.

Robert Loeb in 1932 discovered that if the loss of sodium chloride was stopped by the daily administration of large amounts of this salt, clinical improvement was often marked and sustained. The unfavourable effect of potassium was shown in 1937, and a rational treatment of Addison's disease based on the control of mineral metabolism provided relief but not a satisfactory solution of the problem. In 1930 an extract of the adrenal cortex was made available for patients in a critical condition but this material remained scarce, not always reliable and very expensive. The availability of desoxycorticosterone in 1937 made it possible to control mineral metabolism.

However, since desoxycorticosterone tended to increase the concentration of sodium and decrease that of potassium in the blood when large amounts of this compound were used, it was necessary to limit the intake of sodium and increase potassium in the diet. Many patients have been greatly benefited by this treatment, but few of them were restored to a state of well-being and some patients died even though the electrolytes in the blood were within normal limits. It became evident that something more than control of mineral metabolism was essential. Cortisone, a hormone of the adrenal cortex which influences organic metabolism and many diverse physiologic processes, was not available until this compound was prepared on a commercial scale in 1948. In 1949 it was shown that a daily dose of about 15 mg. of cortisone and 1 to 5 mg of desoxycorticosterone restored strength and a sense of well-being to patients who had Addison's disease. Treatment with cortisone alone was not satisfactory because sodium and chloride were rapidly lost from the body; but when the mineral metabolism was controlled with desoxycorticosterone and at the same time cortisone was administered, the patient was able to resist fatigue and to enjoy an almost normal state of health.

**"ADDLED PARLIAMENT,"** the name usually given to the English parliament which met on April 6, 1614, sat for two months of violent debate, and was finally dissolved by James I. without having passed a single bill. Seven years passed before another parliament was summoned.

**"ADDRESS, THE,"** an English parliamentary term for the reply of the Houses of Parliament (and particularly of the House of Commons) to the speech of the sovereign at the opening of a new parliament or session. There are certain formalities which distinguish this stage of parliamentary proceedings. The "King's Speech" itself is divided into three sections: the first, addressed to "My Lords and Gentlemen," touches on foreign affairs; the second, to the "Gentlemen of the House of Commons," has reference to the estimates; the third, to "My Lords and Gentlemen," outlines the proposed legislation for the session. Should the sovereign in person open parliament, he does so in the House of Lords in full state, and the Speaker and members of the House of Commons are summoned there into the royal presence. The sovereign then reads his speech. If the sovereign is not present in person, the speech is read by commission. The Commons then return to their House, and an address in answer is moved in both Houses. But before this motion a bill is read *pro forma,* a survival of an ancient claim of the Commons to assert their right of deliberation on subjects other than the Crown's immediate cause of summons. The Government of the day selects two of its supporters in each House to move and second the address, and when carrying out this honourable task they appear in levee dress. Previous to the session of 1890–91, the royal speech was answered paragraph by paragraph, but "the address" is now moved in the form of a single resolution, thanking the sovereign for his most gracious speech. The debate on the address is used as a means of ranging over the whole Government policy, amendments being introduced by the Opposition. A defeat on an amendment to the address is generally regarded by the Government as a vote of no-confidence. After the address is agreed to it is ordered to be presented to the sovereign. The thanks of the sovereign for the address are then conveyed to the Lords by the lord steward of the household and to the Commons by the comptroller of the household.

**ADDRESSING MACHINE**: *see* OFFICE APPLIANCES.

**ADE, GEORGE** (1866–1944), U.S. author, was born at Kentland, Ind., on Feb. 9, 1866. After graduating from Purdue University in 1887, he took up newspaper work in Lafayette, Ind., and Chicago (1887–1900). Although he belonged to the school of American vernacular humorists, he was definitely an urban product. Many of his early books, such as *Artie* (1896) and *Doc' Horne* (1899) were designated as stories "of the streets and town" and were adapted from his newspaper contributions. His best-known book, *Fables in Slang* (1899), is clever and sophisticated. Ade wrote a number of musical comedy librettos, film scenarios, including *Back Home and Broke* (1922), and plays, the best known of which were *The County Chairman* (1903), *The College Widow* (1904) and *Father and the Boys* (1908). He died May 16, 1944.

**ADELA** (1062?–1137), daughter of William the Conqueror and mother of Stephen, king of England, whose right to the throne derived through her. She was married to Stephen, earl of Meaux and Brie in 1080 at Breteuil Upon the death of his father in 1090, her husband succeeded to the earldom of Blois and Chartres. She took an active interest in civil and ecclesiastical affairs and was instrumental in rebuilding the cathedral of Chartres in stone. In 1095 she became regent when her husband, at her urging, took part in the first crusade to the Holy Land. He returned in 1099, but left to join the second crusade in 1101 and was killed in battle at Ramula. Adela continued as regent during the minority of her sons and was increasingly active in public life. Anselm, her guest and teacher in 1097, was often entertained by her during 1103 and 1105 and she affected a temporary reconciliation between him and her brother, Henry I. In 1107 Adela entertained Pope Pascal during Easter and in the following year was hostess to Boemund of Antioch. She made her son Theobald successor to her rule in 1109 and entered a convent in the diocese of Autun, continuing to wield an important influence in public and clerical affairs. She persuaded Theobald to join with her brother Henry I against France in 1117 and was a benevolent patroness of churches and monastaries. She died in 1137 and was buried at Caen.

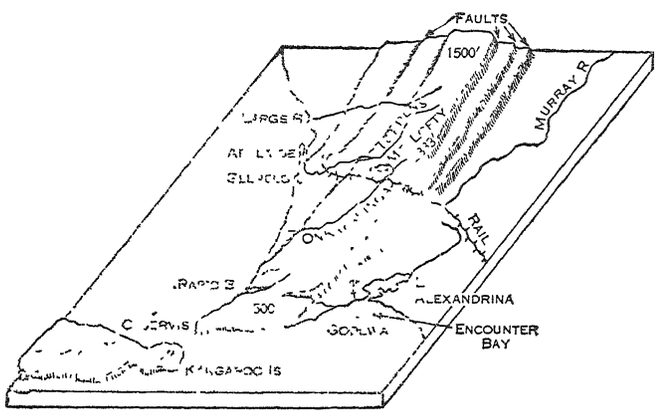
**ADELAER** or ADELER, the surname given to KURT SIVERTSEN (1622–75), Norwegian-Danish sailor. Born at Brevig, in Norway, he entered the Dutch navy and then the Venetian service, where he was known as Curzio Suffrido Adelborst (*i.e.*, Dutch for "naval cadet"). He commanded the Venetian squadron at the battle of the Dardanelles (May 13, 1654) when his ship alone sank 15 Turkish galleys and burned others. Next day he compelled the surrender of the Turks at Tenedos. In 1660 he became admiral-lieutenant in the Venetian service, but in 1662 he was induced to take command of the Danish fleet. Under Christian V he took command of the combined Danish fleets against Sweden, but he died before the expedition.

**ADELAIDE** (ADELHEID) (931–999), queen of Italy and empress, was the daughter of Rudolph II of Burgundy, and married, in 947, Lothair, who succeeded his father Hugh as king of Italy. Lothair died in 950 and Adelaide was imprisoned at Como by his successor, Berengar II, marquis of Ivrea, who wished to compel her to marry his son Adalbert. After four months (August 951) she escaped and took refuge at Canossa with Atto, count of Modena-Reggio. Meanwhile Otto I, the German king, whose English wife, Edgitha, had died in 946, came to Italy. Adelaide met him at Pavia, and at the close of the year the marriage took place. On Feb. 2, 962, she was crowned empress at Rome by Pope John XII immediately after her husband, and she accompanied Otto in 966 on his third expedition to Italy, where she remained with him for six years.

After Otto I's death (May 7, 973), Adelaide exercised for some years a controlling influence over her son, the new emperor, Otto II. The causes of their subsequent estrangement are obscure, but it was possibly due to the empress' lavish expenditure in charity and church building, which was a serious drain on the imperial finances. In 978 she left the court and lived partly in Italy, partly with her brother Conrad, king of Burgundy, by whose mediation she was ultimately reconciled to her son. In 983, shortly before his death, she was appointed his viceroy in Italy, and, in concert with the Empress Theophano, widow of Otto II, and Archbishop Willigis of Mainz, defended the right of her infant grandson, Otto III, to the German crown against the pretensions of Henry the Quarrelsome, duke of Bavaria.

In June 984 the infant king was handed over by Henry to the care of the two empresses; but the masterful will of Theophano soon obtained the upper hand, and until the death of the Greek empress, on June 15, 991, Adelaide had no voice in German affairs. She assumed the regency, in concert with Archbishop Willigis and a council of princes of the empire, and held it until in 995 Otto was declared of age. In 996 the young king went to Italy to receive the imperial crown; and from this date Adelaide devoted herself to pious exercises, to correspondence with the abbots Majolus and Odilo of Cluny, and to the foundation of churches and religious houses.

She died on Dec. 17, 999, and was buried in the convent of Saints Peter and Paul, her favourite foundation, at Salz in Alsace.



By the emperor Otto I she had four children: Otto II (d. 983); Mathilda, abbess of Quedlinburg (d. 999); Adelheid (Adelaide), abbess of Essen (d. 974); and Liutgard.

BIBLIOGRAPHY—Adelaide's life (*Vita* [illegible] *Adalheidae imperatricis*) was written by St. Odilo of [illegible] valuable only [illegible] years, the rest of her life being merely outlined, though her adventures in escaping from Berengar are treated in more detail The best edition is in André Duchesne, *Bibliotheca Cluniacensis*, pp. 353–362. *See* Giov. **ADELAIDE,** capital of South Australia, in the county to which it gives its name, is situated near the middle of the eastern side of St. Vincent gulf where the coast line curves farthest inland (eastward). The genius of Charles Sturt, and then of William Light, the first surveyor-general, selected (1836) a site upon fertile plains which swept up very gently from the coast to a curving line of hills some 9 mi. inland. (Mt. Lofty, *c.* 7 mi. [ air line] E.S.E. of Adelaide, 2,333 ft.) Light chose, not without opposition, a spot on rising ground, close to the Torrens stream, the chief early source of water supply, and within easy reach of a fair open roadstead (Holdfast bay, *c.* 6 mi ). Within 8 mi. also was the only considerable sheltered inlet along this recently elevated coast, the Port Adelaide "river," a deflected tidal estuary. This water—shallow, muddy, but improved by dredging—became the site of Adelaide's port until the construction of the outer harbour provided a more accessible anchorage for larger vessels near the mouth of the estuary and facing the open gulf. Southward the hills close in upon the plain and meet the coast line, but northward the lowlands stretch, broadening, up to and beyond the head of the gulf. Easy movement was possible also by various gaps and saddles to the Murray lowlands in the east and southeast, and Adelaide thus soon became an important nodal point for lines of movement by land and sea. The fertility of the plains—deep alluvium washed down from the torrent-scarred hills—the presence of minerals (though in relatively small quantities) in the hills, and the genial climate formed the basis of Adelaide's prosperity. A fairly regular rainfall of *c.* 21 in. falling largely in the winter months (April–November); temperatures hot in summer (Jan. mean: 73°; highest recorded [shade] maximum 116°, with fairly frequent heat spells); but cool and bracing in winter (June mean: 52° with occasional frosts); land and sea breezes along the coast and much sunshine make up a typical Mediterranean climate. The town was laid out by Light in the form of a square, divided into rectangular blocks with gardens and parks at the points of intersection. Around the square a mile-broad belt of park land was reserved, and beyond these stretch the suburbs. The park lands have been to some extent encroached upon for public buildings, but the remainder form the great playground and "lungs" of the city which claims to have no slums. The

climate and the presence of the river Torrens, now artificially dammed and converted into a lake, lend Adelaide the peculiar charm of diversified vegetation; northwestern European, southern European and subtropical.

After a somewhat chequered early history Adelaide, in virtue of its commanding situation in relation to all the more important southern parts of the state, steadily grew in prosperity and size until, with 312,619 inhabitants, it had a decidedly alarming proportion (nearly 54%) of the total population of the state (1933, 580,949); 1943 estimate, 362,500. Its commercially central position and good communications, ready supplies of raw materials and of imported coal, and a protective tariff have built up in the metropolitan area (particularly along the main lines to Port Adelaide) a number of flourishing young industries, manufacturing woollens, machinery, pottery, etc. To Adelaide gravitate the products of the agricultural and pastoral areas of the surrounding fertile districts, and thither also, for lack of a river-mouth port, come the bulk of the products—wool, wheat, fruit—of the lower Murray valley (*see* ALEXANDRINA, LAKE). The trade of Port Adelaide is five to six times as valuable as that of any other South Australian port, and fourth as regards value and tonnage among the ports of Australia. In 1938–39 the imports at Port Adelaide were worth £5,500,000 and the exports £10,000,000. The city possesses many fine buildings, including the university, School of Mines, an Anglican and a Roman Catholic cathedral, exhibition building and others. It was the birthplace of municipal government in Australia and gained a lord mayoralty in 1919.

FROM TAYLOR, "AUSTRALIA" (METHUEN, 1940)

BLOCK DIAGRAM OF THE SITE OF ADELAIDE AT THE SOUTHERN END OF THE FLINDERS RANGE. THE BLOCK IS ABOUT 100 MI. WIDE

**ADELARD** or **AETHELARD** of Bath (12th century), English scholastic philosopher. He studied in France and travelled in Spain, Italy, north Africa and Asia Minor, where he became acquainted with Arabian scholarship. He returned to England in the time of Henry I, and received an annual grant from the revenues of Wiltshire. Adelard translated Euclid's *Elements,* probably from an Arabic version. The work, which was published in Venice in 1482 under the name of *Campanus de Novara,* at once began to be used as a textbook in the schools. Adelard's special contribution to scholastic philosophy was the treatise *De eodem et diverso,* in which he enunciated the theory of "indifference."

It is in the form of a dialogue between himself and his favourite nephew, and was dedicated to Richard, bishop of Bayeux from 1113 to 1133. He wrote also a group of treatises on the astrolabe (a copy of which is in the British museum), on the abacus (three copies exist in the Vatican library, the library of Leyden university and the Bibliothèque Nationale in Paris), translations of the Kharismian tables and an Arabic *Introduction to Astronomy.*

BIBLIOGRAPHY—*See* C. Jourdain, *Recherches sur les traductions d'Aristote* (2nd ed., 1843); Barthélemy Hauréau, *Philosophie scolastique* (2nd ed., 1872); and works appended to art. *See* also SCHOLASTICISM.

**ADELIE COAST,** Antarctic land situated on the polar circle in longitude 140° E., discovered by the Frenchman Dumont d'Urville in 1840. The steep coasts, rising to heights of from 3,250 to 4,000 ft., are almost unapproachable. Although covered with snow and ice and completely uninhabited, it has possibilities of utilization for whale fishing. (*See* also ANTARCTIC REGIONS.)

ADELSBERG: *see* POSTUMIA-GROTTE.

**ADELUNG, JOHANN CHRISTOPH** (1732–1806), German grammarian and philologist, was born at Spantekow in Pomerania, on Aug. 8, 1732. He was educated at the [illegible] of Anklam and Klosterbergen, and the University of [illegible]. In 1759 he was appointed professor at the gymnasium of Erfurt, but relinquished this position two years later to take up residence at Leipzig, where he devoted himself to philological researches and the voluminous writings he continued to produce throughout his life. In 1787 he was made principal librarian to the elector of Saxony at Dresden, where he lived until his death on Sept. 10, 1806.

By his grammars, dictionary and various works on German style, Adelung helped to rectify the orthography, refine the idiom and fix the standard of his native tongue. His German dictionary—*Grammatisch-kritisches Wörterbuch der hochdeutschen Mundart* (1774–86)—bears witness to his intimate knowledge of the history of the different dialects on which modern German is based. No man before Jacob Grimm (*q.v.*) did so much for the language of Germany. At the time of his death Adelung was engaged on a work on general philology, entitled *Mithridates, oder allgemeine Sprachenkunde.* Unfortunately he did not live to complete it.

The first volume, which deals with the Asiatic languages, was published immediately after his death; the other two were issued under the superintendence of Johann Severin Vater (1771–1826).

**ADEMPTION,** a taking away; in law, a revocation of a grant or bequest.

**ADEN,** seaport and territory in Arabia, situated in 12° 45′ N. and 45° 4′ E. on a peninsula near the entrance to the Red sea, 100 mi. E. of the Strait of Bab al-Mandab. The peninsula of Aden has barren and desolate volcanic rocks, rising to 1,776 ft. and extending 5 mi. from east to west and 3 mi. from its northern shore to Ras Sanailah, or Cape Aden, its most southerly point; it is connected with the mainland by a neck of low sandy ground. The town is built on the eastern coast, in the crater of an extinct volcano, and is surrounded by precipitous rocks forming an admirable natural defense.

There are two harbours: an outer, facing the town, protected by the island of Sirah, but partially choked with mud; and an inner, called Aden Back-bay, or, by the Arabs, Bandar Tawayih, on the western side of the peninsula. The new Aden, called Steamer Point, houses the U.S. and other consulates, the principal banks and shipping offices.

Drinking water, which was obtained before 1930 by condensing sea water, was later amply supplied by a pipe line from artesian wells on the mainland.

Aden early became the chief entrepôt of trade between Europe and Asia. It is the Ἀραβία εὐδαίμων of the *Periplus.* It was known to the Romans as *Arabia Felix* and *Attanae* and was captured by them, probably in the year 24 B.C. It was unsuccessfully attacked by the Portuguese under Albuquerque in 1513, but fell into the hands of the Turks in 1538. In the following century the Turks relinquished their conquests in Yemen, and the sultan of San'a established a supremacy over Aden, which was maintained until 1735, when the sheikh of Lahaj, throwing off his allegiance, founded a line of independent sultans.

From the 16th to the 19th centuries traffic between Europe and the east had mostly gone via the Cape of Good Hope. The annexation of Aden to British India in 1839 renewed trade between India and the Red sea and this developed enormously after the cutting of the Suez canal. Aden was made a free port and a coaling station, and its territory was extended by cession or purchase. The island of Perim in the Strait of Bab al-Mandab was occupied in 1857.

In addition to its east and west trade Aden developed many commercial relations with the interior and with the opposite coast of Africa. The chief imports are fuel oil, petrol (gasoline), coffee,

cotton piece goods, grain, hides, coal, sugar and tobacco. The exports are, in the main, the same as the imports. Aden itself produces salt and cigarettes. The trade is largely one of transshipment

Imports for 1949 amounted to Rs. 42,63,00,879[1]; exports to Rs 18,76,73,189. In that year 3,600 merchant ships of 15,924,948 tons (net) entered the port of Aden, besides 2,500 local craft.

The submarine cables of Cable and Wireless, Ltd., diverge there on the one hand to India, the far east and Australia; on the other, to Zanzibar and the Cape of Good Hope. There are no railways in the colony, and communications between the townships are by road

By mid-20th century there were several regular air services between Aden and Cairo (via Jibuti, Asmara and Khartoum, or via Jidda and Port Sudan); to Addis Ababa; and to Nairobi via Hargeisa and Mogadishu; and to Mukalla in the eastern Aden protectorate during the summer monsoon. The population of the Aden colony at the 1946 census was 80,876, of which 365 were of European and allied races.

**Boundaries and Administration.**—After the kingdom of the Yemen (*q.v.*) became independent of the Ottoman empire it refused to recognize the boundary between itself and the western Aden protectorate which was determined by the Anglo-Ottoman convention of 1905. The matter was left open by the Anglo-Yemeni treaty of Feb. 11, 1934, but it was agreed in Jan. 1951 to form a joint commission to demarcate frontiers and settle the disputes which had occurred from time to time. As a result of disputes concerning the border with Yemen, Great Britain and Yemen broke diplomatic relations in 1949; however, in March 1951 they were resumed.

On April 1, 1937, Aden passed from the control of the India office to the colonial office; its currency became the East African shilling in place of the rupee in June 1951. In Jan 1947 a legislative council was inaugurated, consisting of the governor, four ex-officio members, not more than four official members and not more than eight unofficial members representing the various communities.

The Aden protectorates, eastern and western, have an area of about 110,000 sq.mi. with an estimated population of 650,000 in 1950, organized into about 30 sultanates, sheikhdoms and other tribal units in treaty relations with the British government. The principal of these are the Qu'aiti state of Shihr and Mukalla and the Kathiri state of Sai'un, both in the eastern protectorate; and the 'Abdali sultanate of Lahaj in the western.

BIBLIOGRAPHY.—Colonial Office, London, *Annual Reports on Aden*, with further bibliography; the Master of Belhaven, *The Kingdom of Melchior* (London, 1949); Doreen Ingrams, *A Survey of Social and Economic Conditions in the Aden Protectorate* (Eritrea, 1949).

(G. E. K.)

**ADENÈS,** ADENEZ or ADANS, surnamed Le Roi, French trouvère, was born in Brabant about 1240. He owed his education to the kindness of Henry III, duke of Brabant, and he remained in favour at court for some time after the death (1261) of his patron.

In 1269 he entered the service of Guy de Dampierre, afterward count of Flanders, probably as *roi des ménéstrels*, and followed him in the next year on the abortive crusade in Tunis. The expedition returned by way of Sicily and Italy, and Adenès left in his poems some very exact descriptions of the places through which he passed.

The poems written by Adenès are four: the *Enfances Ogier, Berte aus grans piés, Bueves de Comarchis* and a long *roman d'aventures, Cléomadès*, borrowed from Spanish and Moorish traditions brought into France by Blanche, daughter of Louis IX. Adenès probably died before the end of the 13th century.

BIBLIOGRAPHY.—The romances of Adenès were edited for the Académie royale de Belgique (*Cléomadès* by A. van Hasselt, 1865–66; *Berte, Les Enfances Ogier, Bueves de Commarchis* by A. Scheler, 1874); *Berte* was rendered into modern French by G. Hecq (1897) and by R. Périé (1900); *Cléomadès*, by Le Chevalier de Chatelain (1859). *See* also the edition of *Berte* by Gaston Paris (1832); Léon Gautier, *Les épopées françaises*, vol. iii, etc.

[1] 100,000 rupees is written as Rs. 1,00,000; 10,000,000 is written 1,00,00,000.

**ADENOIDS.** A condition, commonly found in children, produced by excessive growth of the pharyngeal tonsil or adenoid (*see* PHARYNX). The enlargement may block the nasal passages or the eustachian tube and produce disturbances in breathing and in hearing

If severe, the child may assume a characteristic vacant, stupid expression accompanied by mouth breathing. The presence of these growths may handicap the child in his physical and mental development. The removal is a relatively simple operative procedure

(F. L. A.)

**ADEODATUS,** pope and saint (?–676), became bishop of Rome on April 11, 672, and died on June 16, 676

Little is known of his life before 672 except that he was a monk in the Roman monastary of St. Erasmus, whose quarters he later helped to enlarge.

During his pontificate the Monothelite controversy (*q.v.*) over the unity or duality of Christ's will was still active between the sees of Rome and Constantinople To Adeodatus, during this controversy, was ascribed the rejection of the *Synodikon* tendered by Constantine I of Constantinople, and the repression of the Monothelite heresy.

Also ascribed to him is the work of restoring the basilica of St Peter at Campo di Merlo near Rome. Beyond these few works little else is known of his reign as pontiff. Of his writings, only letters of his to the abbeys of St. Peter of Canterbury and St Martin of Tours are extant, both relating to the granting of privileges to these churches Occasionally he is referred to as Adeodatus I being the alternative name of an earlier pope Deusdedit (*q.v.*).

**ADEPT** (if used as a substantive pronounced *ad*ept, if as an adjective a*dept;* Lat. *adeptus*, "one who has attained"), completely and fully acquainted with one's subject; an expert.

The word implies a natural inborn aptitude, more than acquired proficiency. In olden times an adept was one versed in magic, an alchemist

**ADERNÒ** (ADRANO), town of the province of Catania, Sicily, 22 mi. by rail N.W. of the town of that name Pop. (1936) 24,307 (town), 24,515 (commune). Anciently Adranon (the original Siculan settlement was perhaps about 5 mi. away), it took its name from Adranos, an indigenous deity, in Roman times identified with Vulcan, to whom was dedicated a temple guarded by 1,000 huge dogs. Substructures of the temple may persist outside the town. The town, founded by Dionysius I (*c.* 400 B.C.), has fine remains of its walls (*see* P. Orsi in *Not. Scavi*, p. 227 [1915]).

For a time it was the headquarters of Timoleon, and it was the first town taken by the Romans in the First Punic War (263 B.C.). In the centre of the modern town rises the castle built by Roger I.

**ADES,** nonalcoholic beverages made from the juice of lemons, oranges or limes, powdered sugar or syrup and plain, mineral or carbonated water. Usually a maraschino cherry and cracked ice, and a straw through which to sip the drink, are added.

Ades are sold in the United States chiefly at soda fountains and drugstores. "Orange drinks" are also served at street stands and corner shops, as are drinks made from the juice of pineapple, grapefruit, etc.

The juice of the fruit is ordinarily extracted through electrical machines installed at soda fountains.

The advantage in this method lies in the fact that the customer sees with his own eyes the fresh fruit and the resulting unadulterated juice.

**ADHAN:** *see* AZĀN.

**ADHEMAR DE CHABANNES** (*c.* 988–1034), mediaeval historian, was born at Chabannes, Fr. He was a monk of the monastery of St. Cybard, Angoulême, and died at Jerusalem.

Adhémar's principal work, *Chronicon Aquitanicum et Francicum,* or *Historia Francorum,* is in three books and deals with Frankish history from the fabulous reign of Pharamond, king of the Franks, to A.D. 1028.

The two earlier books are scarcely more than a copy of the *Gesta regum Francorum,* but the third, dealing with the period from 814 to 1028, is of considerable historical importance, and

is published in the *Monumenta Germaniae historica, Scriptores,* iv (Hanover and Berlin, 1841).

A critical edition of the entire *Chronicon,* prepared by Jules Chavanon (1897), is in the *Collection de textes pour servir à l'étude et à l'enseignement de l'histoire* Other writings of Adhémar's are published by J. P. Migne in the *Patrologia Latina,* tome cxli (Paris, 1844–55)

*See* F Arbellot, *Étude historique et littéraire sur Adémar de Chabannes* (Limoges, 1873).

**ADHEMAR** (ADEMAR, AIMAR, AELARZ) **DE MONTEIL** (d 1098), crusader, became bishop of Puy-en-Velay after the deposition of his predecessor by Gregory VII in 1077. He made a pilgrimage, possibly to Jerusalem, in 1086–87

It was from Puy that Urban II, on Aug 15, 1095, convened the council that met at Clermont in the following November; there he began the preaching of the first crusade Adhemar, the first of his audience to take the Cross, was appointed by Urban to lead the crusade as his legate

He travelled to Constantinople with Raymund IV of Toulouse and the Provençal contingent During the crossing of Asia Minor and the siege of Antioch (May 1097 to June 1098) there was no supreme commander of the crusade, but Adhemar played a leading part in the counsels and activities of its leaders He was prominent in military operations and in the situation which developed during the siege of Antioch when Peter Bartholomew claimed to have discovered the Holy Lance. He organized the mass religious devotions at times of crisis, and he began to establish friendly relations with the eastern Christians

He appears to have commanded universal respect and affection and so restrained the quarrels that arose from the conflicting ambitions of the lay leaders. This was his greatest service to the expedition.

After Adhemar's death of the plague in Antioch (Aug. 1, 1098), division within the army became so acute that the crusade almost foundered

(R C. SMA.)

**ADHESIVE CEMENTS:** *see* CEMENT: *Adhesive Cements.*

**ADIABATIC CHANGE,** a change in the physical state of a body, whether this change be one of volume, strain, electric charge, etc., which involves no passage of heat to or from the body.

(*See* THERMODYNAMICS.)

**ADIABATIC PROCESSES IN ATMOSPHERE.** Because of the large volumes of air involved and the relatively small temperature differences between adjacent air parcels, it is common to assume that no heat is added to or withdrawn from the air (adiabatic process) during atmospheric processes.

This assumption appears to be justified for air which is not in contact with the ground and for processes which are completed in from a few hours to a day. When air ascends or descends it expands and contracts as a result of the change in pressure. If no condensation or evaporation of water occurs the air will cool about 1° C. per 100 metres rise (5.4° F. per 1,000 ft.), which is called the dry adiabatic lapse rate.

When moist air is lifted it will cool at the dry adiabatic rate (the presence of moisture has a negligible effect until saturation is reached) until it becomes saturated. Further lifting will result in the condensation of water vapour or cloud formation. The latent heat of condensation is added to the air and as a result it cools less rapidly, at the so-called moist or saturated adiabatic lapse rate.

The value of the moist adiabatic lapse rate depends on the temperature and pressure being about 0.44° C. per 100 metres at 20° C and 1,000 mb and 0.80° C. per 100 metres at −20° C. and 600 mb. If saturated air descends it follows the moist adiabatic lapse rate only as long as it contains liquid water in suspension which can evaporate; otherwise it follows the dry adiabatic lapse rate. If an air parcel of absolute temperature $T_o$ and pressure $p_o$ is dry-adiabatically compressed or expanded to a pressure $p$, its temperature T is given by $T=T_o(p/p_o)^{.286}$.

(*See* METEOROLOGY; LAPSE RATE OF TEMPERATURE, THERMODYNAMICS, UPPER AIR SOUNDINGS)

(H G HN)

**ADIAPHORISTS,** the name of a party in the religious controversies of the 16th century in Germany. The Adiaphorist controversy among Lutherans was an issue of the provisional scheme of compromise between religious parties, drawn up by Charles V, [illegible] at the Diet of Augsburg, May 1548, and known as the Augsburg Interim. It satisfied neither Catholics nor Protestants. As head of the Protestant party the young elector Maurice of Saxony negotiated with Melanchthon and others, and at Leipzig, Dec. 1548, secured their acceptance of the Interim as regards *adiaphora* (things indifferent), points neither enjoined nor forbidden in Scripture. This sanctioned jurisdiction of Roman Catholic bishops and observance of certain rites, while all were to accept justification by faith (relegating the words "by faith *alone*" to the *adiaphora*). Passionate opposition was led by Melanchthon's colleague, Matthias Flacius, on the grounds that the imperial power was not the judge of *adiaphora,* and that the measure was a trick to bring back popery. From Wittenberg he fled, April 1549, to Magdeburg, making it the headquarters of rigid [illegible]. Practically, the controversy was concluded by the religious peace ratified at Augsburg (Sept. 1555), which left princes a free choice between the rival confessions with the right to impose either on their subjects; but much bitter internal strife was kept up by Protestants on the theoretical question of *adiaphora;* to appease this was one object of the Formula Concordiae, 1577. Another *Adiaphorist* controversy between Pietists and their opponents, respecting the lawfulness of amusements, arose in 1681, when Anton Reiser (1628–86) denounced the opera as anti-Christian.

*See* J. Herzog and A. Hauck, *Realencyklopädie* (3rd ed.); and F. Hastings, *Encyclopaedia of Religion and Ethics,* art. "Adiaphorism" where the connection of this historic question with the fundamental question of what is vital or essential is shown. For an earlier study, on rigourist lines, *see* E. Schmid, *Adiaphora, wissenschaftlich u. historisch untersucht* (1809).

**ADIGE,** river, north Italy. The Adige rises in small lakes on the Resia (Reschen Scheideck) pass (4,944 ft.), and near Glorenza is joined by tributaries where roads over the Ofen and Stelvio passes fall in. It flows E. to Merano, and S.E to Bolzano, where it receives the Isarco (6 ft ), and becomes navigable. Turning S.W., and receiving the Noce (right) and the Avisio (left), it enters Lombardy, 13 mi. S. of Rovereto. It falls into the Adriatic at Porto Fossone, a few miles N. of the Po. The most considerable towns on its banks (south of Bolzano) are Trento, Rovereto, Verona and Legnago. It is very rapid, with sudden floods which do great damage. In Lombardy it is 200 yds wide, and 10 to 16 ft. deep, but the strong current impedes navigation. The Adige is 220 mi. long and, after the Po, the most important river in Italy. In Roman times its lower course lay much farther north than now, along the base of the Euganean hills, and it entered the sea at Brondolo. In A.D. 587 the river broke its banks and took its present course, but new streams opened repeatedly to the south, until now the Adige and Po form one delta.

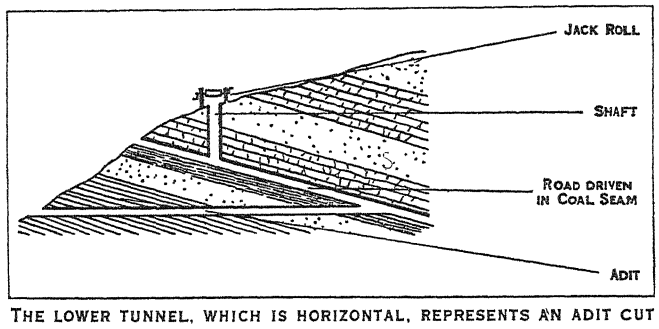
**ADIGEI** (ADYGEI), autonomous region in the north Caucasian area of the R.S.F.S.R., created July 1922. It is a narrow strip of territory lying north and south of lat. 45° and curving south at about long. 41° E., forming an autonomous island in the north Caucasian area, mainly along the south banks of the Kuban river and Laba river, from west of Krasnodar to south of Labinsk. It was formerly part of the Kuban province. The Kuban river is navigable to its confluence with the Laba river but is malarial and swampy and frequently floods its banks. The population (1939) 241,773 is entirely rural and is administered from Krasnodar, for which purpose it is divided into the following sections:—Dzhidzhikhablsk, Natyrbovsk, Preobrazhensk, Takhtamykaevsk, Khakyrino-Khabalsk. The Adigei or Adygei (their own name) or Cherkess (their Russian name) are Circassians who formerly occupied the mountain valleys but were compelled by Russia in 1861 either to settle on the flat land or to emigrate (200,000 settled in Turkey, as the Bashi-Bazouks). They are mainly Alpine in physical type and speak a language of the

Abkhazo-Adigean group of the "Spirant" branch of the Japhetite languages Their religion was Mohammedan, mingled with old heathen and modern Christian rites. Cattle and sheep rearing were their chief occupations, and great respect to seniority and hospitality, and fierce vendettas, were characteristic Their present habitat is on the southern limit of the black-earth steppe region where it merges into the broad-leaved, deciduous forest. They are now mainly an agricultural people, with wheat, maize and sunflower seed as the chief crops; consequently, their old customs are rapidly dying out

**ADIPOCERE,** a substance into which animal matter is sometimes converted (from the Lat. *adeps,* "fat," and *cera,* "wax"), and so named by A F. Fourcroy, from its resemblance to both fat and wax. When the Cimetière des Innocens at Paris was moved in 1786–87, great masses of this substance were found where the coffins containing the dead bodies had been placed very closely together Chemically, adipocere consists principally of a mixture of palmitic, margaric and oxymargaric acids combined with a little ammonia; glycerine appears to be absent (*see* also under OILS, FATS AND WAXES)

Lime, derived from the tissues, is present with other substances as an inorganic residue It appears that it is not formed from protein, but from the body fats which collect together and undergo decomposition

**ADIPOSE TISSUE** is composed of specialized connective tissue cells which contain large globules of fat. The chief chemical constituents of this fat are the neutral glycerol esters of stearic, oleic and palmitic acids. The fat stored in these cells comes in part directly from the fats eaten, and in part is manufactured within the body from fats and carbohydrates in the food and sometimes from protein. The main reservoir of fat in the body is the adipose tissue beneath the skin, called the *panniculus adiposus.* There are also deposits of fat between the muscles, among the intestines and in their mesentery, around the heart and elsewhere.



Besides acting as a fuel reserve against times of starvation or great exertion adipose tissue helps conserve the heat of the body and forms soft and elastic pads between the various organs.

**ADIRONDACKS,** a group of mountains in northeastern New York, U.S., in Clinton, Essex, Franklin and Hamilton counties, often included by geographers in the Appalachian system, but pertaining geologically to the Laurentian highlands of Canada. Unlike the Appalachians, the Adirondacks do not form a connected range, but consist of many summits, isolated or in groups, arranged with little appearance of system. There are about 100 peaks, ranging from 1,200 to more than 5,000 ft in height, and 42 more than 4,000 ft., the highest peak, Mt. Marcy (called by the Indians Tahawus, or "cloud splitter"), is near the eastern part of the group and attains an elevation of 5,344 ft. Other high peaks are McIntyre, 5,112 ft ; Skylight, 4,920; Haystack, 4,918, and Whiteface, 4,872. These mountains, consisting of various sorts of gneiss, intrusive granite and gabbro, have been formed partly by faulting but mainly by erosion, the lines of which have been determined by the presence of faults or the presence of relatively soft rocks. The mountains form the water parting between the Hudson and the St. Lawrence rivers. On the south and southwest the waters flow either directly into the Hudson, which rises in the centre of the group, or else reach it through the Mohawk. On the north and east the waters reach the St. Lawrence by way of Lakes George and Champlain, and on the west they flow directly into that stream or reach it through Lake Ontario. The most important rivers within the area are the Au Sable, Black, Oswegatchie, Grass, Raquette, Saranac and Ausable Among the larger lakes are the Upper and Lower Saranac, Big and Little Tupper, Schroon, Placid, Long, Raquette and Blue Mountain. The surface of most of the lakes lies at an elevation of more than 1,500 ft. above the sea; their shores are usually rocky and irregular, and the wild scenery within their vicinity has made them very attractive to the tourist.

The region known as the Adirondack Wilderness, or the Great North Woods, embraces between 5,000 and 6,000 sq mi of mountain, lake, plateau and forest, which for scenic grandeur is almost unequalled in any other part of the United States. Railways and highways penetrate the heart of the region and small boats ply upon the larger lakes Well-marked trails lead to the crests of the better-known peaks The mountains are easily reached from Plattsburg, Port Kent, Herkimer, Malone and Saratoga Springs. Every year thousands spend the summer months in the wilderness, where cabins, hunting lodges, villas and hotels are numerous. The resorts most frequented are in the vicinity of the Saranac and St Regis lakes and Lake Placid

In the Adirondacks are some of the best hunting and fishing grounds in the eastern U S At the head of Lake Placid stands Whiteface mountain, from whose summit one of the finest views of the Adirondacks may be obtained Two miles southeast of that lake, at North Elba, is the old farm of the abolitionist John Brown, which contains his grave and is much frequented by visitors Lake Placid is the principal source of the Ausable river, which for a part of its course flows through a rocky chasm from 100 to 175 ft deep and rarely more than 30 ft wide At the head of the Ausable chasm are the Rainbow falls Another impressive feature of the Adirondacks is Indian pass, a gorge about 11 mi long, between Mt McIntyre and Wallface mountain, a majestic cliff rising vertically from the pass to a height of 1,300 ft Keene valley, in the centre of Essex county, is another picturesque region, presenting a pleasing combination of peaceful valley and rugged hills The climate during the winter months is very severe—the temperature sometimes falling as low as —42°—it is beneficial to persons suffering from pulmonary troubles and a number of sanatoria have been established The region is heavily wooded with spruce, hemlock, pine and hardwood trees Lumbering has been much restricted by the creation of a state forest preserve, containing in 1927, 1,884,643 ac., and by the purchase of large tracts for game preserves and recreation grounds by private clubs The so-called Adirondack park, containing more than 3,000,000 ac., includes most of the state preserve and large areas held in private ownership

**ADIT.** An adit is the name given to a horizontal working made from the surface to strike a seam of coal or a mineral vein Other names for an adit are "day drift," "day hole" surf (forest of Dean), "sough" (lead mines of Derbyshire), "water-gates" (north of England), "sorre" (Yorkshire), "arndod" and "audit" as well as adit Mining by means of adits is very ancient, and was practised in hilly country where the seams were cut by valleys. It was perhaps the earliest method of mining. The adits were driven at such a level as to drain off the water from the workings. The figure shows a seam coal outcropping on the side of a hill with ventilating shaft and adit level. In modern times a number of adit tunnels were driven at much lower levels for the purpose of draining off the water in old earlier workings, in metal mines in the western part of Canada, the United States and Mexico. Inclines are sometimes called adits.

THE LOWER TUNNEL, WHICH IS HORIZONTAL, REPRESENTS AN ADIT CUT ACROSS THE STRATA, TO "WIN" AND DRAIN A COAL SEAM

Sometimes the coal was carried up the shaft on the backs of men or women climbing ladders, or by means of a jack roll worked by manual labour The coal was worked by means of narrow passages driven in the coal, small pillars being left for the support of the roof The extent to which working was possible was limited by three factors. lack of ventilation, crush of pillars and water difficulties Mechanical ventilation was not practised. A fire was placed in the shaft to heat the air and so increase the air current. The pillars were made very small with a view to getting as much coal as possible, and as the area worked extended, a point was reached at which the support offered by the pillars of coal became insufficient and a crush of the superincumbent strata supervened, inducing a "creep" or heaving-up of the floor, if the floor were a soft fireclay. If the floor was hard, a "thrust" took place and the pillars were crushed The methods of raising the water from the dip workings to the water level or adit being by means of pumps worked by manual labour, it was not possible to proceed far to the dip from beyond the point where the adit struck the seam of coal or, as it was termed, beyond "the line of free drainage."

Where the ground was flat, working by adits was not possible, so that it was usual, in very early times, to get the coal by means of bell pits (*q.v.*) sunk near the outcrop. (R. R.)

**ADJECTIVE,** a word used chiefly in its grammatical sense of limiting or defining the noun to which it refers (Lat. *ad-jacio,* "to throw to"). Grammarians used to speak of a noun and its adjective together as a noun-adjective. In the art of dyeing,

adjective colours are those which require mixing with some basis to render them permanent.

**ADJECTIVE LAW.** This term means the law of procedure and distinguishes it from the substantive law, which it is designed to enforce, the former being viewed as the machinery by means of which the latter is brought into operation

**ADJOURNMENT,** the act of postponing a meeting of any private or public body, particularly of parliament, or any business, until another time, or indefinitely (in which case it is an adjournment *sine die*). The word applies also to the period during which the meeting or business stands adjourned

**ADJUDICATION,** generally the determination of an issue by the exercise of judicial power; the entry of a decree or judgment by a court. In bankruptcy proceedings an adjudication is an order of court declaring a debtor to be bankrupt. (*See* BANKRUPTCY)

**ADJUNCT,** that which is joined on to another, not an essential part, and inferior to it in mind or function, but nevertheless amplifying or modifying it. (Lat. *ad,* "to," *jungere,* "to join.") Adverbs and adjectives are adjuncts to the words they qualify. Twelve members of the Royal Academy of Sciences in Paris are called "adjuncts"

**ADJUSTMENT (IN LAW):** *see* AVERAGE.

**ADJUSTMENT (IN PSYCHOLOGY)** is the process of behaviour by which men, and other animals as well, maintain an equilibrium between their needs and the demands and obstacles of their environments In its simplest form, a sequence of adjustment begins when some need is felt and ends when that need is satisfied. For example, a hungry dog is stimulated by his physiological state to engage in varied activities such as searching, begging and barking. When one of these responses brings him food, he eats and thereby reduces or removes the stimulus that set the activity sequence in motion. He is then adjusted to this particular need.

In general, the adjustment process involves four parts: (1) a motive or need in the form of a strong persistent stimulus; (2) the thwarting or nonfulfilment of this need; (3) varied activity, or trial-and-error behaviour, leading eventually to [illegible] some response that removes the initiating stimulus [illegible] adjustment

Some of the mo[illegible] adjustive behaviour are simple physiological needs such as hunger and thirst Certain other strong motives combine physiological elements and cultural or learned factors, as illustrated by the sex motives Of great importance in complex human adjustments are the social motives involved in interactions with other persons, including needs for security, approval, recognition, achievement, mastery and the like These motives are not inborn, but are strongly inculcated by learning processes that begin early in life To a great extent, they are determined by social standards and differ from one culture to another. Thus, typical persons in the European-American culture have a strong motivation to succeed and excel which is markedly lacking in persons who live in some so-called primitive cultures.

Two main kinds of thwarting may be distinguished—frustration and conflict A frustration is an external circumstance or an act of another person that prevents the fulfilment of an aroused motive. An adolescent may want to use the family automobile to drive to a dance, but be frustrated because the automobile is out of order or because his father forbids him to use it. A conflict is the arousal of two or more strong motives that cannot be satisfied together A youngster may want to go to a dance to feel that he belongs to a group and does what his friends do. For an adolescent in our culture, that is a strong motive. But the youth may be a clumsy dancer and sensitive to the real or imagined ridicule of his fellows. Therefore, he also has a motive to avoid the dance to escape humiliation He is in a dilemma; whether he goes or stays away he will experience distress. Psychologically, a conflict exists when the reduction of one motivating stimulus involves the increase of another, so that a new adjustment is demanded.

The psychological criterion of the solution of an adjustment is the elimination or reduction of the stimulation that was the source of the activity. In the total behaviour of a human being, however, adjustments rarely occur in isolation, but many have to be made simultaneously. Satisfactory adjustment therefore requires unified and integrated behaviour, in which all motives are reasonably satisfied with due regard to their functioning as an interrelated system.

**Substitute Adjustments.**—Adjustments to simple physiological needs such as hunger or thirst can be made only [illegible] The organism must eat and drink or it will die. Adjustments to social motivations, however, permit a variety of solutions, some of which are more direct and more satisfying than others. Suppose, for example, that a university student fails his examinations This is a situation demanding adjustment, for it thwarts not only his educational and vocational plans, but also his strong social needs for security, approval and achievement The student may adjust by finding and remedying the cause of his difficulties, by increasing his effort or by changing his plans in a rational manner, all of which are direct and constructive solutions He may also adjust by blaming others for his failure, by claiming that the examinations were unfair, by emphasizing his attainments in other than academic tasks (such as athletics), by daydreaming of imaginary successes or by developing an apparent illness that excuses his failure All of these are adjustments of a sort, for they are in some degree satisfying to the social needs for success and approval

A number of the more common varieties of substitute adjustments have been named and defined, and are usually known as adjustment mechanisms

Adjusting by overemphasizing a trait in order to conceal a weakness is known as *compensation* Thus, a boy who fears his own lack of strength in competition with his equals may adjust by becoming a bully of younger children; a man sensitive to his own lack of education may affect the use of long words; or an unattractive girl may call attention to her intellectual or vocational accomplishments Compensations are somewhat satisfying because they are rather close substitutes for the thwarted achievement, and because they divert attention from the deficiency that the person feels The mechanism of *rationalization* is somewhat similar. In rationalizing, the individual convinces himself, and attempts to convince others, that there are socially acceptable reasons for conduct that is determined by quite different motives Selfishly based behaviour is defended as socially acceptable, or as no worse than that of other persons.

In *projection,* individuals attribute to others the traits and motives that are the subject of their own conflicts The student resisting a strong temptation to cheat may be unusually sensitive to this evil and think that he sees dishonesty in many acts of others. Rationalization and projection are the psychological bases of delusions found in some persons suffering from severe mental disorders Blaming their failures on others gives rise to delusions of persecution, while delusions of grandeur serve to support a sense of importance and to explain why they were selected for persecution

In other instances, persons will adjust to social difficulties by withdrawing from contacts with other people and developing phantasies of [illegible] achievements. The mechanism of *regression* consists of learning to forget or ignore distressing thoughts, [illegible] in both mild and serious maladjustments. It is illustrated by the "blind spots" that normal people have with respect to their own shortcomings and, at the extreme, by the almost complete forgetting of a person's past life which may be his reaction to catastrophic conflicts. *Regression* is a reversion to an adjustment [illegible] earlier period of life, as when an older child competes for the attention of his parents by reverting to infantile [illegible] may also adjust by becoming ill, which excuses their failures and permits them to escape from unbearable situations Illnesses as adjustments are mainly examples of *hysterical* mechanisms which, like most other types, vary greatly in severity The reluctant schoolchild's nine-o'clock headache expresses his distaste for academic tasks; a soldier's paralyzed arm may resolve the conflict between his pride and his guilt or fear

If a person with serious frustrations or conflicts cannot find a reasonably satisfactory direct or substitute solution, he remains in a nonadjustive state He is activated by motivating stimuli that he cannot reduce, and therefore is tense, overactive and susceptible to emotional reactions. Common evidences of nonadjustment are anxiety, worry and so-called "nervousness."

It must be emphasized that substitute adjustments are usually unconscious in the descriptive sense of this term. The person who employs them does not deliberately attempt to deceive others. Instead, he hits upon a type of behaviour that reduces his motivations and gives him a vague sense of relief from tension He does not understand the source or meaning of his reactions, and often is anxious to improve his adjustments but does not know how to do so.

Substitute adjustment mechanisms are used by all people and are not abnormalities in themselves. The difference between quite normal people who display many of these mechanisms, and people who are severely maladjusted or psychoneurotic, is one of degree rather than of kind of behaviour.

**Readjustment.**—Persons who suffer from difficulties of psychological adjustment can be helped by psychotherapy, a process of treatment carried out by psychiatrists, clinical psychologists or psychiatric social workers, or by clinics in which these qualified specialists work as a team. They recognize that advice, persuasion or punishment are not effective means for accomplishing readjustment.

Psychotherapy is a series of conferences between the therapist and the client. The therapist listens to the client's story, accepts his motivations, conflicts and inadequate behaviour without reproach or praise, and makes responses that acknowledge and clarify the client's attitudes and feelings. In the permissive and supportive atmosphere provided by the therapist, the client becomes able to recall and to piece together significant aspects of his past experiences and present attitudes that hitherto he was unable to face. The client learns, at his own pace and through his own thinking, to react to his conflicts more calmly and constructively. Improvement in his everyday behaviour may follow. (*See* PSYCHOTHERAPY; PSYCHOLOGY)

(L F SR)

**ADJUTANT,** a helper, or junior in command, one who assists his superior, especially an officer who acts as an assistant to the officer commanding a battalion or unit of similar scale. In the British army the appointment of adjutant is usually held by a captain or lieutenant The adjutant acts as staff officer to the commanding officer, issues his orders, superintends the work of the orderly room and the general administration of the corps and is responsible for the training of recruits. Regular officers are appointed as adjutants to units of the territorial army. In the French army, however, the title is given to senior underofficers of superior grade to sergeant. On the European continent the word is not restricted to the lower units of organization; for example, in Germany the *Adjutantur* includes all "routine" as distinct from "general" staff officers in the higher units, and the aides-de-camp of royal persons and of the higher commanders are also styled adjutants general, *Flügel-adjutanten,* etc.

**ADJUTANT BIRD,** the name given to large storks (*q.v.*), of the genus *Leptoptilos,* distinguished by their dull plumage, black scabrous head and enormous pouch, of doubtful function, connected with the respiratory system The largest is *L dubius* of India. It feeds on offal, frogs and fish, and is a most efficient scavenger, for which reason it is usually protected. Other species are *L. javanicus* of southeast Asia and *L. crumeniferus,* the marabou stork of Africa; the "marabou" feathers of commerce were originally the undertail coverts of this bird, but the name is now applied to a large number of kinds of downy feathers.

**ADJUTANT GENERAL,** an army official, originally (as indicated by the word) the chief assistant (Lat. *adjuvare*) staff officer to a general in command, but now a distinct high functionary at the head of a special office in the British and U.S. war departments. In England the second military member of the army council is styled adjutant general to the forces. He is a general officer and at the head of his department of the war office, which is charged with all duties relative to personnel. The adjutant general of the U.S. army is one of the principal officers in the war department, the head of the bureau for army correspondence, with the charge of the records, recruiting, issue of commissions, etc Individual U.S. states also have their own adjutant general, with cognate duties regarding the state militia. In many countries the term has retained its original meaning of an officer on the personal staff, and is the designation of personal aides-de-camp to the sovereign.

**ADLER, FELIX** (1851–1933), U.S. educationalist, was born at Alzey, Ger., Aug. 13, 1851. His father, a Jewish rabbi, emigrated to the United States in 1857, and the son graduated at Columbia college in 1870. After completing his studies at Berlin and Heidelberg, he became professor of Hebrew and oriental literature at Cornell university, Ithaca, N.Y. (1874–1876). In 1876 he established in New York city the Society for Ethical Culture. In 1902 he became professor of political and social ethics at Columbia university. Adler took a prominent part in philanthropic and social reform movements, such as the erection of model tenement houses and the abolition of child labour. He published *Creed and Deed* (1877), *The Moral Instruction of Children* (1892), *Marriage and Divorce* (1905), *The Religion of Duty* (1905), *The World Crisis and Its Meaning* (1915), *An Ethical Philosophy of Life* (1918) and *The Reconstruction of the Spiritual Ideal* (Hibbert lectures at Oxford, 1923). He died April 24, 1933.

**ADLER, HERMANN** (1839–1911), British chief rabbi, born at Hanover, Ger., on May 30, 1839, the son of N. M. Adler, was educated at University College school and University college, London, and then at Prague under Rapoport. After receiving the rabbinical diploma at Prague, he returned to England to become temporary principal of the Jewish Theological college in London for two years. With this college he was associated in one capacity or another all his life. He began his ministry at the Bayswater synagogue in 1864, and continued to preach there until 1891, when he became chief rabbi on the death of his father. Adler was a prominent figure in English public life, and served on many Mansion House committees and on various bodies concerned with the improvement of social conditions in London He died on July 18, 1911 A collection of his sermons, entitled *Anglo-Jewish Memories and Other Sermons,* was published in 1909

His daughter, NETTY, sat on the London county council for Central Hackney from 1910–25 and was deputy chairman of the council in 1922–23. She served on many committees in connection with social questions, but her principal work was done in education. She began her social work as a school manager under the local school board, was then co-opted a member of the London education committee 1905–10, and in the county council was closely connected with the administration of the schools Apart from education, she was interested in the welfare of children from all points of view, having been for many years joint honorary secretary on the committee for the protection of wage-earning children, and a member of the London Advisory Council for Juvenile Employment

**ADLER, NATHAN MARCUS** (1803–1890), British chief rabbi, was born at Hanover, Ger., Jan. 15, 1803, and died at Brighton, Eng., on Jan. 21, 1890. He took his degree of Ph.D at Erlangen in 1828. He was ordained in the same year, was chief rabbi of Oldenburg (1829) and of Hanover in 1830, and on Oct. 13, 1844, was elected chief rabbi in London. There he originated and carried out his scheme for a Jews' college for the training of teachers, which was founded in London on Nov 11, 1855, with himself as its first president. In 1860 Adler suggested the establishment of a United Synagogue which should bring all the British congregations under one central administration; this idea was realized in 1870, when the United Synagogue bill was passed in parliament. Adler's writings include sermons and commentaries on Hebrew texts, the best known of which is *Nethinah la-ger,* a commentary on the Aramaic paraphrase of Onkelos on the Pentateuch (1874).

**ADLER, VIKTOR** (1852–1918), Austrian politician, was born at Prague, June 24, 1852. He began to occupy himself early with political and social questions. In 1883 he went to study in Switzerland and in London, where he came into close touch with F. Engels. On his return to Vienna, however, he turned entirely to politics. The Workmen's party had sunk into political insignificance and Adler's task was to restore unity in the ranks of labour. In 1886 appeared his paper *Gleichheit,* eventually succeeded by *Die* [illegible] principal organ of the Social Democratic party, which Adler continued to conduct till his death. In July 1889 he appeared at the first congress of the Second International, of which he became an official, as the representative of the united Austrian Labour party. From that time he was the acknowledged leader of the party

Adler regarded it as his first task to secure for the workers representation in parliament, but it was not until 1907 that he was able to secure universal and equal suffrage The Social Democratic party increased their representation from 11 deputies to 87. [illegible] entered the di[illegible] in 1902, and in 1905 was elected to the *reichsrat,* where, until his death, he played an important part.

In the congress and in the secretariat of the International, Adler, with A Jaurès and A. Bebel, played the most prominent part, whether as leader, adviser or mediator. After the collapse of Austria in 1918 at the constituent session of the provisional German-Austrian national assembly, he read the declaration of the Social Democrats, in which they expressed their willingness in association with the other German-Austrian parties, to build the new state on the basis of democracy and self-determination, without prejudice to a possible association with the German empire He held for a few days the office of foreign minister, but he broke down and died Nov. 12, 1918, the day on which the state council had decided to proclaim German Austria a democratic republic, and an integral part of [illegible] reich.

BIBLIOGRAPHY.—His works include articles scattered in various newspapers, in the *Neue Zeit; Kampf; Deutsche Worte* (Vienna), in addition to those in the *Arbeiterzeitung;* pamphlets, among which are *Die Fabrikinspektion, insbesondere in England und der Schweiz* (1884); *Die Arbeiterkammern und die Arbeiter* (1886); *Die Gleichheit vor dem Ausnahmegericht* (1889); *Das allgemeine, gleiche und direkte Wahlrecht und das Wahlunrecht in Oesterreich* (1893); *Schwurgerichtsprozess gegen Doktor Viktor Adler wegen Verbrechens der Störung der öffentlichen Ruhe* (1894); *Alcoholismus und Gewerkschaft* (many editions) (1907).

**AD LIBITUM** (Lat., "at pleasure"), in music, a direction signifying that the performance of the passage in question is left to the unfettered discretion of the performer; also that a given portion of a composition, such as the accompaniment of a choral piece, may be omitted if desired.

**ADMETUS,** in Greek legend, son of Pheres, king of Pherae,

in Thessaly. By the aid of Apollo, who served him as a slave—either as a punishment for having slain the Cyclopes, or out of affection for his mortal master—he won the hand of Alcestis, the most beautiful of the daughters of Pelias, king of Iolcus. Finding that Admetus was soon to die, Apollo persuaded the Fates to prolong his life, provided any one could be found to die in his place. His parents refused, but Alcestis consented. She was rescued by Heracles, who wrestled with Death and made him give her back.

**ADMINISTRATION,** the performance or management of affairs, a term specifically used in law for the administration or disposal of the estate of a deceased person. (*See* WILL or TESTAMENT.) It is also used generally for "government," and specifically for "the government" or the executive ministry, and in such connections as the administration (administering or tendering) of the sacraments, justice, oaths, medicines, etc.

**Letters of Administration.**—Upon the death of a person intestate or leaving a will to which no executors are appointed, or when the executors appointed by the will cannot or will not act, the probate division of the high court is obliged to appoint an administrator who performs the duties of an executor. This is done by the court granting letters of administration to the person entitled. Grants of administration may be either general or limited. A general grant is made where the deceased has died intestate. Formerly, on the death of the owner of realty and personalty intestate, the realty vested in the deceased's heir and the personalty in the court of probate until administrators were appointed. Now, since the rights of heirs as such are abolished by the Administration of Estates Act 1925, all the property, real and personal, vests in the court. Moreover, formerly the right to be appointed administrator was more or less defined Now by the same act the court is given an absolute discretion as to whom it shall appoint, subject to these limitations: that where there is no special reason to the contrary some person interested in the residuary estate should be appointed, and that where the estate passing on the deceased's death includes land settled otherwise than by his will the trustees of the settlement should be appointed (s. 10). Not more than four persons are to be appointed administrators (Judicature Act 1925, s. 160); and separate administrators may be appointed to the real and to the personal estate of the deceased (Administration of Estates Act 1925, s. 13). In the absence of statutory next-of-kin the crown, on the death intestate of an owner of land and personalty, is now entitled to both as *bona vacantia,* escheat both to the intermediate lord and to the crown being abolished. If a creditor claims and obtains a grant he is compelled by the court to enter into a bond with two sureties that he will not prefer his own debt to those of other creditors.

The more important cases of grants of special letters of administration are the following:—

Administration *cum testamento annexo,* where the deceased has left a will but has appointed no executor, or the executor appointed has died or refuses to act. In this case the court will make the grant to the person with the largest beneficial interest.

Administration *de bonis non administratis:* this occurs in two cases: (1) where the executor dies intestate after probate without having completely administered the estate; (2) where an administrator dies. In the first case the principle of administration *cum testamento* is followed, in the second that of general grants in the selection of the person to whom letters are granted.

Administration *durante minore aetate,* when the person nominated by the will as executor is under age.

Administration *pendente lite,* where there is a dispute as to the person entitled to probate or a general grant of letters the court appoints an administrator till the question has been decided.

**ADMINISTRATIVE COMMISSION** is the name applied in the United States to a governmental agency headed by a group of persons rather than by an individual and charged with the enforcement or execution of a law or laws. In Great Britain such agencies are more often known as administrative boards, such as the Local Government board (1871–1919); however, the civil service commission (1855– ) offers an example of a different practice in nomenclature. There also have been numerous royal commissions consisting of prominent citizens designated by the government of the day to study troublesome public questions and offer suggestions for needed legislation. These bodies, however do not have administrative functions.

In the United States, administrative commissions first appear among national governmental agencies with the creation of the civil service commission under the Pendleton act of 1883 This was followed, in 1887, by the Interstate Commerce commission in 1914 by the Federal Trade commission, in 1916 by the United States tariff commission and the United States employees' compensation commission, in 1920 by the Federal Power commission in 1934 by the Federal Communications commission and the Securities and Exchange commission, and in 1936 by the United States Maritime commission which, in turn, was successor to the United States Shipping board, created in 1916. While the name commission is the most common among such administrative agencies in the national government of the United States, it is not universal. Functions similar to those performed by the agencies just enumerated are entrusted to the [illegible] board, created in 1934 to take the place of the earlier United States Board of Mediation (1926–34), the Railroad Retirement board (1935– ), and the National Labor Relations board (1935– ).

It is necessary, in the United States as well as in Great Britain, to distinguish between administrative commissions and government corporations. Examples of the latter include, in Great Britain, the British Broadcasting corporation and in the United States, the Tennessee Valley authority. While such agencies normally have plural heads and are charged with governmental administrative functions, their legal status differs from that of the administrative commission. They are usually provided with capital by the government, but are free to operate within the scope of their charters without bureaucratic intervention in administrative details. Ex-officio and advisory bodies are not properly included among administrative commissions, since they have no continuing responsibility for the execution of law.

Administrative commissions in the United States vary in size from 3 to 11. They are appointed by the president with the advice and consent of the senate, but they are not represented in the president's cabinet. In most cases the law establishing the agency provides that no more than a simple majority of the members may belong to the same political party.

Such agencies are found not only in the national government of the United States, but also in the several state governments and occasionally in city government. The most common state agencies of this type include industrial commissions, boards of health, boards of education, boards of public welfare and unemployment compensation commissions. In local government they appear mainly in the fields of health and education.

Administrative commissions are commonly used where quasi-legislative and quasi-judicial as well as executive functions are to be discharged. Thus these agencies offer a means of escape from a rigorous application of the separation of powers doctrine in government. Legislators, in establishing new commissions, show an increasing tendency to delegate to them broad powers of subordinate legislation. Judges and lawyers deprecate the tendency to confide judicial powers to administrative tribunals, but the expense and delay of proceedings in the regular courts make supplementation inevitable. While boards are not as well suited to the performance of administrative duties as are single-headed departments, they do provide continuity of policy through long overlapping terms of office, insulate the execution of the law from partisan political interference and permit the representation of interest groups concerned with the administration of legislation.

*ings* (1941); Joseph P. Chamberlain, Noel T. Dowling, Paul R. Hays, *The Judicial Function in Federal Administrative Agencies* (1942), Robert E. Cushman, *The Independent Regulatory Commissions* (1941). (HA. W.)

**ADMINISTRATIVE LAW.** Administrative law consists of all those principles and rules of law which together furnish the legal matrix of public administration. This description, it will be noted, differentiates administrative law from the rest of the law solely in terms of its subject matter. Indeed, in Anglo-American jurisprudence there exists no separate body of law which deals with this subject matter. Instead, the pertinent principles and rules find their sources scattered through constitutions, statutes, judicial decisions, and even administrative regulations and orders. The factor, however, which gives them a significant unity is their common bearing upon the organization and functioning of the administrative authorities of the modern state (*see* AUTHORITY, ADMINISTRATIVE).

**Scope of Administrative Law.**—It follows from the definition of administrative law that its scope corresponds exactly with that of public administration. The administrative system exists primarily to render public services and exercise public controls of persons or property. To this end the law must establish appropriate administrative agencies, vest in them certain powers, prescribe the scope and limits of such powers, provide means of enforcing the administrative decisions made in the exercise of such powers, and furnish the private parties who may be affected with remedies or safeguards against administrative action which is arbitrary, discriminatory or unauthorized.

Of the powers delegated to administrative authorities by modern regulatory statutes, four types may be mentioned: (1) the *rule-making power,* or the power to issue general rules and regulations having the force of law for the purpose of filling up the details of statutory policy; (2) the *licensing power,* or the power to grant or refuse, to renew, and to revoke licences or permits which may be required by statute for the pursuit of [illegible] as law and medicine and the conduct of certain forms of business; (3) the *investigatory power,* or the power to require witnesses to testify and produce books, papers and records for the purpose of acquiring the information needed for effective regulation; and (4) the *directing power,* or the power to issue, usually after notice and an opportunity to be heard, administrative orders by which the private party is required, in conformity with the governing statute, to do or refrain from doing specified things.

Whatever the public service and control functions of the administrative system may be, however, their performance depends upon its also conducting auxiliary operations which relate to its organization as a going concern, provision for its personnel and [illegible] the financing, planning and over-all administrative management of its varied activities. Accordingly, the law must also establish rules to authorize and govern these auxiliary and managerial operations and the relations which the administrative system is to bear with respect to them to other parts of the government.

In the United States early efforts at systematic treatment of these aspects of the law consisted mainly of bringing together the pertinent principles of judge-made law under the heading, "the law of public officers." Around the turn of the century, however, Frank Johnson Goodnow made, against the background of the systems of continental Europe, the first comprehensive study of U. S. "administrative law" conceived as the legal framework of public administration. In this new perspective many common law principles considered under the older heading found their appropriate place.

**Purposes of Administrative Law.**—Only by bringing together from all sources the relevant legal principles is it possible to acquire that over-all view of the legal mould of public administration which clarifies its purposes and gives intelligent guidance to its development. In the broadest sense, the problem of administrative law is an aspect of the central problem of political theory: the reconciliation of authority and liberty. More specifically, the purposes of legal control of public administration are: (1) to establish administrative authorities and enable them to carry out public policies designed to protect the public interest, and (2) to safeguard private interests against administrative arbitrariness or excess of power.

It is important to remember, however, that in the larger view each of these interests includes the other as a factor. The public interest includes the welfare of all members of the community, those who are regulated no less than those for whose protection regulation is undertaken. Accordingly, the public interest itself suffers if those who are regulated become victims of administrative oppression. Yet it is equally true that the private interest of those who are regulated includes in the long run the public interest. They may profit in the short run if the law renders ineffective administrative efforts to prevent their exploitation of the public; but by the same token it may render ineffective their protection against forms of exploitation indulged in by others. The aim of administrative law is thus to attain a synthesis of public and private interests in terms of the social and economic circumstances and ideals of the age.

**Droit Administratif versus the Rule of Law.**—Some form of judicial control of administrative action is so necessary to the protection of private interests against administrative abuse as to have come in the western world to be considered a characteristic feature of free government. In broad outline, however, this judicial control has for historical reasons taken two different forms, the continental European and the Anglo-American.

Of the former the French system of *droit administratif* is perhaps typical. That system provides for a high degree of administrative centralization, and exempts the administrative authorities from control by the ordinary tribunals. This does not mean, however, that these authorities are free from all forms of judicial control. For in France there are two separate systems of courts, the ordinary and the administrative. The former try cases under the civil and criminal codes, while the latter try cases involving official action. The highest administrative court, the judicial branch of the council of state, has developed a body of case law which has given satisfaction at home and received high praise from many foreign observers.

In England, on the other hand, there developed a decentralized administrative system, with central control exercised by the king's judges as a part of their common law jurisdiction. In the long struggle with the Stuarts the foundations of the modern system were completed. Chief Justice Sir Edward Coke exalted the common law as a sort of embodiment of natural justice and symbolized its supremacy as against the high prerogative claims of James I. The long parliament abolished the star chamber and other extraordinary courts, which had threatened to become engines of Stuart tyranny. The "Glorious Revolution of 1688" marked the final establishment of the legislative supremacy of parliament; and the Act of Settlement gave the judges tenure during good behaviour. Thereafter, even the servants of the crown were amenable to the ordinary law of the land, which meant the law administered by the independent judges of the common law and chancery courts on the basis of judicial precedents or acts of a sovereign parliament.

From the beginning of the 18th century, therefore, there has been in England and in every country which derived its jurisprudence from [illegible] but a single hierarchy of courts, the ordinary judicial tribunals, which hear cases involving official action as an incident of their common law or statutory jurisdiction, and which apply to such cases no separate body of law, but the law of the land in the form of the common law, equity, statutes and (where they exist) written constitutions. Under the name of the "rule of law" this system was idealized in 1885 by A. V. Dicey in his *Law of the Constitution;* and in countries in which the rule of law in this special sense prevails, administrative law is an appropriate name for those general and special principles and remedies of the law of the land by which the ordinary courts control administrative action.

Those accustomed to one of these two systems run the risk of judging the other in terms of their own. The basis of a practical comparison would be topic by topic in terms of attainment of the purposes of administrative law. Dicey's volume became a classic

of English-speaking legal literature; but his comparison of the rule of law with *droit administratif* has been subjected to searching criticism. He described the rule of law, for example, as excluding the existence of "wide discretionary authority on the part of the government"; but the growth in England of administrative discretion caused even Dicey to admit in his eighth edition of 1920 that this development had "some features which faintly recall" French administrative law.

Dicey further declared that the rule of law means the "equal subjection" of official and citizen to "the ordinary law of the land administered by the ordinary Law Courts"; but what matters in practice is not whether there are two bodies of law and two kinds of courts or only one, but whether the balance struck between public and private interest is comparable under the two systems. Even the common law treats cases involving official action differently in some instances from those in which this factor is absent; and if the injured citizen may hold the government responsible in place of the officer, it is certainly not obvious that there is any practical virtue in holding the officer personally responsible merely in order to subject him to the same law that governs the citizen. The peculiar virtue which the rule of law possesses in this respect is that it symbolizes the Anglo-American distaste for the idea that officialdom is a class apart, to which special deference is due The subtlety of this virtue, however, goes beyond all practical considerations.

French administrative litigation is far less expensive and burdened with technicalities than that in U.S. courts. Though the members of the judicial branch of the French council of state do not have formal independence of the administration, of which they are technically a part, it is said that they enjoy practical independence. The fact that they bring to their task either administrative experience or training in administrative law or both might even tend to make their judgment more balanced than that of judges trained only in the common law and private practice.

Whatever the respective merits, however, of these two great systems, the French and the Anglo-American, each is so deeply rooted in historical experience and tradition that, though they may still further approach each other in results, this is likely to take place [illegible] modification rather than wholesale importation.

**The Extraordinary Remedies.**—In England, judicial control of administrative action was first systematically worked out through use of the prerogative writs. These ancient writs were originally granted only to the king for the control of local officers, but in time came to be available to private parties as against the central administration, and still play an important part in the administrative jurisprudence of both Great Britain and the U S In the latter country they are known as the extraordinary remedies. Five of them are products of the common law, while the sixth, the injunction, is a product of equity. Since an understanding of their nature is a first step in the study of Anglo-American administrative law, they will be briefly described in turn.

*Quo warranto* may be used to try the legal title of one assuming to exercise a public office. At common law the action may be brought only in the name of the state by the attorney general, who may proceed *ex officio* or on the petition of another. The latter is known as the relator, while the one whose title to the office is to be tried is known as the respondent. It is no defense for the respondent to show that he is the officer *de facto;* if he fails to show that he is presently the officer *de jure,* the state is entitled to judgment of ouster. This involves removal of the respondent; and thereafter all pretended official acts done by him are void for all purposes. If the relator claims to be the lawful officer, the court may incidentally pass upon his claim of title.

By the writ of *mandamus* the court orders a public officer to perform a particular nondiscretionary act which it is his legal duty to perform and the legal right of the petitioner to have performed. The writ is issued only if there is no other adequate remedy. It is not used to control official discretion, but it may order an officer to exercise a discretion which it is his legal duty to exercise. It is also used in effect to correct gross abuse of discretion, as when the officer admits facts which show that his only reason for noncompliance is an arbitrary one. The writ is not available to compel a general course of action in law enforcement; for this would make the court in effect the supervisor of an executive function.

Described as the strong arm of equity, the *injunction* is issued by a court exercising equitable jurisdiction to compel the defendant, who may be a public officer, to do or refrain from doing a particular thing. If the writ orders him to do something, it is called a mandatory injunction; while if it orders him to refrain from doing something, it is called a preventive injunction The latter is the more usual form, and is sought by one party against threatened infringement of his rights at the hands of another. The court may issue a temporary or interlocutory injunction to preserve the *status quo* until a full hearing can be had The permanent injunction is the final order of the court It is to be granted only if there is no adequate remedy at law; that is, only if the threatened injury could not be adequately redressed by money damages. In U.S. administrative law, however, injunctions have been so freely granted as to give rise to severe criticism An injunction against a public officer to restrain him from proceeding under an unconstitutional statute or in excess of his statutory authority is not considered a suit against the government, and hence does not require statutory consent.

By the writ of *certiorari* the court may order up from a lower court or administrative agency the record of proceedings of a judicial nature for the purpose of quashing or affirming the same An early U.S view that the scope of judicial review on common law certiorari is confined to the correction of jurisdictional errors was later shown to have been based upon a misconception of the English cases. The New York court of appeals long ago abandoned this view, and held that this writ was available, not indeed to reweigh the evidence, but to correct errors of law and to examine the case upon the whole of the evidence in order to determine whether, as a matter of law, there was any evidence which could warrant the decision. On the other hand, since in the federal courts injunction furnishes an adequate remedy, certiorari plays no important part in federal administrative law.

The writ of *habeas corpus* has well been described as the palladium of personal liberty. Upon proper application it is directed to the party, be he a private person or a public officer, who is exercising restraint upon the personal liberty of another, and orders him to produce the body of the person detained and show legal cause for the detention Upon his return to the writ a summary hearing is held. If legal cause or justification is shown, the body is remanded to the custody of the officer or other party. Otherwise, the court or judge will discharge the prisoner. The writ is available against administrative authorities in quarantine, extradition, and alien cases, and to test the jurisdiction of the military authorities over one who denies such jurisdiction.

The writ of *prohibition* runs to an inferior court or other tribunal exercising judicial power to restrain it from proceeding in excess of its jurisdiction. It is not issued when there is an adequate remedy by appeal. If the inferior tribunal is found to be exceeding its jurisdiction, judgment involves prohibiting it from entertaining any further proceedings in the matter. In U.S. administrative law the utility of the writ is restricted by the fact that it may be denied to the petitioner on the ground that the licensing or other administrative agency is exercising administrative rather than judicial power.

**The Scope of Judicial Control.**—The scope of judicial control of administrative action depends upon such variable factors as the nature of the governmental function involved, the type of administrative power which is being exercised, the wording of the particular statute in question, and the technical features of the form of relief which may be available in the courts. U.S. courts have worked out certain general principles governing the extent to which they will, in reviewing administrative determinations, regard them as conclusive or as liable to reversal; but

these principles are subject to qualification in diverse types of situation. The courts tend to require that all available and adequate administrative remedies, such as appeal from an inferior to a superior administrative officer, be exhausted before resort may be had to judicial relief; and they do not ordinarily interfere with administrative discretion. They regularly re-examine administrative determinations of questions of law, but give great weight to the interpretations of statutes made by those charged with their administration, and in case of doubt accept them as binding. Findings of fact, if supported by substantial evidence, are ordinarily accepted as conclusive; but this is a controversial subject, with a division of opinion between those who emphasize the importance of protecting private interests and those who emphasize the importance of strengthening administrative effectiveness in the public interest

**Notice and Hearing.**—Another safeguard of private interest is notice and hearing as a part of administrative adjudication. For the administrative exercise of so-called quasi-judicial powers, or those which are regarded as analogous in character to judicial power as exercised by the courts, *audi alteram partem* (that the other side be heard) is a requirement of the common law. In the U.S. notice and an opportunity to be heard are in such cases generally a requirement also of constitutional due process of law. While administrative tribunals are not bound in such hearings by all the technical rules of evidence which prevail in judicial trials, they are held to deny due process of law if they fail to apply "the rudimentary requirements of fair play."

In the making of administrative rules and regulations, an analogous safeguard is prior consultation of the private groups concerned. This is not constitutionally necessary; but good practice calls for informal consultation, and the governing statute may make formal consultation a prerequisite of issuance.

**The Enforcement of Administrative Decisions.**—Further protection of private interests is afforded by the fact that, in the U S , due process of law generally requires that, for the enforcement of administrative decisions, resort must be had to the courts. In this connection mention may be made of some of the more common means of enforcement which are provided by modern regulatory statutes. The statute may make it a misdemeanor to violate administrative rules and regulations or administrative orders or to practise a profession without a licence. It may specify a statutory appeal to court, by the administrative authority concerned, for judicial enforcement of its order which has been disobeyed. It may provide that an administrative order become final if no appeal is taken by the private party affected within a specified time, and that violation thereafter subjects the offender to a civil penalty recoverable by governmental suit in the proper court. In each of these illustrations judicial enforcement is preceded by an opportunity for judicial review to determine the validity of the administrative decision.

In an exceptional class of situations, however, due process of law is not violated by authorizing administrative authorities to execute their own decisions. An example of common law origin is summary abatement of public nuisances which endanger the public health or safety. The property of a delinquent taxpayer may also be summarily seized and sold for satisfaction of the tax. There are even some examples of administratively imposed fines. It is to be noted, however, that even summary action is subject to some form and degree of later judicial review.

**Government Liability in Tort.**—In an important class of cases the French *droit administratif* gives the private citizen more effective remedies than are furnished by Anglo-American administrative law. This is in cases in which private parties are wrongfully injured by official action. In considering such injuries French jurisprudence distinguishes between those caused by fault of service (*faute de service*) and those caused by the personal fault (*faute personelle*) of the official. For his personal faults the French functionary is liable before the ordinary courts; but for faults of service the council of state holds the government itself liable. Indeed, by holding the government responsible for damages in situations where there was in fact no fault of either sort, the council of state has seemed to some observers to be approaching something like a doctrine of risk liability by which the state insures the citizen against all exceptional injuries caused by the functioning of the public services.

In Anglo-American law wrongs other than breaches of contract are called torts. But in England the doctrine that the king can do no wrong relieves the crown, or in other words the government, of legal responsibility for torts committed by its servants and places that responsibility solely upon those servants personally, though the government may see fit to come to their relief In the U S. the national and state governments are not amenable to suit without their consent given by statute; though municipal corporations are held liable for the torts committed by their agents in connection with their proprietary or business as distinguished from their strictly governmental functions. While congress, for example, has given its general consent for the national government to be sued on its contracts, it has not done so in cases involving torts. It has, however, given governmental corporations like the Reconstruction Finance corporation the general capacity to sue and be sued.

Now this personal liability of the officer is often unsatisfactory for the officer himself, for the injured party and for the public interest. This may be seen from cases in which it has been held by U.S. courts that, if the owner cannot get a hearing before his property is summarily destroyed for the protection of the public health, he is entitled to his hearing afterward in a tort action against the officer. In such a situation, the officer may be held personally liable for money damages if a jury disagrees with his determination that a horse now destroyed had [illegible] and hence constituted a public nuisance. The owner may get a personal judgment against the officer, only to find that he has nothing with which to pay it. The knowledge on the part of the officer that he may be held personally responsible if a jury of 12 laymen later disagrees with his expert judgment may cause him to hesitate to act at his own peril in the public interest.

The inadequacies of such a solution become increasingly evident as the operations of modern government are expanded. For the public interest demands on the one hand that these operations be effectively carried out, while on the other hand their expansion enhances the likelihood of their causing injury to the private citizen. At the same time, however, faults of service are after all faults of officials; and it is not sufficient to give the citizen an effective remedy against the government if, by relieving officials of personal liability, the responsibility with which they act is so dulled as to produce an increase of avoidable injuries and an unnecessary burden upon the public treasury.

**Problems Resulting from the 20th Century Growth of Administrative Authority.**—In the first half of the 20th century both England and the U.S. witnessed a broadening of governmental functions and a corresponding growth of administrative authority. Parliament, congress, and state legislatures vested more and more powers of a quasi-legislative and quasi-judicial nature in administrative agencies. This development was a direct and inevitable result of the economic and social changes wrought by the industrial-technological revolution which swept over the western world. At the same time, however, it posed new problems in administrative law. In broad terms, these problems centre around the question: how shall this new "administrative justice" be reconciled with the traditional "rule of law?"

The growth of administrative discretion, inconsistent as it is with the traditional conception of the rule of law, seems to be a permanent feature of modern government. In terms of the rule of law, then, the crucial question is the extent to which this administrative discretion is subject to control by the courts. Otherwise, the problem shifts to that of providing an administrative personnel and administrative procedures which will tend to cause this discretion to be exercised with fairness.

*Controversy and Appraisal.*—This growth of administrative justice has been the object of vigorous attack in both England and the U.S. In the former, criticism was brought to a head by the publication in 1929 of Lord Hewart's *The New Despotism.* In his opinion the situation in England was characterized by

"administrative lawlessness" rather than "administrative law." For him the new despot was the bureaucratic despot. In consequence of this denunciation, the lord high chancellor appointed a committee on ministers' powers, whose *Report* in 1932 took a middle view. It regarded quasi-legislative and quasi-judicial powers as inevitable, but proposed various limits and safeguards.

This report also mentioned a subject which is much discussed in the U.S., when it declared (p. 78) that "bias from strong and sincere conviction as to public policy may operate as a more serious disqualification than pecuniary interest." In the U.S. various regulatory boards and commissions initiate complaints of violation of legal standards and then hear their own complaints and render decision. Critics say that this arrangement makes the agency both prosecutor and judge and gives it such an interest in deciding that its charges are true that it becomes judge in its own cause. They object further because, on judicial review, the case comes to the court with the facts already found and with the findings of fact conclusive upon the court if supported by substantial evidence.

In response to this criticism the proposals have been various. At one time there was considerable discussion of the advisability of creating a central administrative court empowered to review administrative adjudications and in so doing to reweigh the evidence. In 1937 the president's committee on administrative management proposed complete separation of the two functions by vesting that of prosecution in an administrative section under the control of the appropriate executive department and that of making decisions in a judicial section which would be independent of the department except in matters of "housekeeping." In 1941 the U.S. attorney general's committee on administrative procedure advocated preservation of the unified over-all responsibility of the board or commission at the same time that its staff is provided with independent hearing commissioners empowered to conduct hearings and to make decisions appealable to it.

In the U.S. criticism culminated in specific efforts to "curb" administrative authority by general legislation intended to extend the scope of judicial review or to impose procedural safeguards. Outstanding among such efforts were a proposal made in 1938 by a New York state constitutional convention and the Logan-Walter bill passed in 1940 by the U.S. congress; but the former measure was rejected by the New York electorate, and the latter was vetoed by the president.

The problem is a real one, and goes to the heart of the purposes of administrative law. Unfortunately, however, the discussion is too often conducted by partisans who forget the ideal of the golden mean. Apologists for untrammelled administrative authority think only of the need for effective enforcement of policies intended to protect the general welfare by the regulation of private economic power, and forget that fairness to those regulated is a factor in the general welfare. Critics of administrative adjudication think only of the traditional safeguards of the rule of law, and forget that without modification these safeguards would hamstring modern government in its necessary effort to maintain the public interest by defending all the other major private groups against the abuse of power by any one of them.

Thus some of the traditionalists tend to assume an analogy between the modern bureaucrat and James I or between the modern administrative tribunal and the star chamber. The analogy, however, is misleading. The task of the Stuart period in English constitutional history was to render arbitrary political power responsible to the nation; while the task of the 20th century is to employ responsible political power for the purpose of imposing responsibility to the community upon the arbitrary economic power which the industrial-technological revolution has centred in various special groups. This new and different task calls for new tools which are more flexible than detailed legislation enforced by the judicial process. The modern bureaucrat is one of these indispensable tools.

This does not mean, however, that the modern bureaucrat is to be treated as a philosopher-king to whose wisdom and benevolence may be assigned the government of mankind. The bureaucrat can no more safely be entrusted with irresponsible power than an hereditary monarch or an independent judge. It follows that questions of executive accountability and bureaucratic responsibility, which are always with us, have become more pressing than ever before.

The industrial revolution created a new situation; and in all new situations the intelligent approach is neither to scrap traditional methods nor blindly to adhere to their outmoded forms. The problem is partly one of readaptation. Judicial review is an historic safeguard which should be reinterpreted in terms which are meaningful under modern conditions; but this reinterpretation should preserve as much of the old as is compatible with the effectiveness of administrative action in the public interest. The problem is also partly one of invention. New safeguards must be invented to take the place of those particular features of the rule of law which are no longer workable. One avenue for creative thought leads in the direction of improvement of administrative personnel; but the future may hold new answers of which nobody has yet dreamed. Such an approach calls for careful appraisal in contradistinction to both negative criticism and uncritical acceptance of the administrative function.

**ADMINISTRATIVE REGULATION** can best be defined by contrasting it with legislative regulation. The latter consists in the detailed determination of rights and duties by statute and their enforcement, either at the instance of private parties or on the government's initiative, by means of the regular law enforcement machinery. Administrative regulation, by contrast, leaves much more to the discretion of government officials, generally members of specialized administrative agencies which normally possess considerable independence from the cabinet or chief executive. This power may be exercised by issuing general rules elaborating broad statutory grants of authority, by granting, denying, or revoking licences or permits, or by issuing mandatory orders.

Discretionary administrative power is in no sense a new phenomenon. The licensing power in particular has long been used, especially for the protection of the public health and safety. Restaurants, for example, commonly are not permitted to operate without a licence, which can be secured only by meeting certain standards of sanitation. But the term "administrative regulation" usually refers to the application of the administrative method to the regulation of business for what may be broadly termed economic objectives. In this sense administrative regulation is a comparatively recent development.

In England the establishment of a Railway commission in 1873 may be taken as the starting point. This semi-administrative tribunal was little more than a specialized court, but its weakness led to the creation later of agencies with more power. The Railway Rates tribunal, which was set up in 1921, still is more of a court than an administrative regulatory agency; however, it does

possess extensive discretionary authority, although it still has no power to initiate proceedings. The Electricity commissioners, established in 1919 for the licensing of electricity suppliers, have quite broad regulatory powers. They have complete control over who shall produce electricity and under what conditions and at what prices. After 1930, public service passenger vehicles using streets and highways have, like railways, been subject to extensive control. In this case, moreover, the law is administered by authorities (the Area Traffic commissioners) who possess wide discretionary powers and do not follow a rigid, legalistic procedure. Similar but more limited regulation was extended to goods transport (trucking) in 1933. In a slightly different category are the various boards set up by authority of the Agricultural Marketing acts of 1931 and 1933. Producers of a given commodity may secure the permission of the minister of agriculture for the establishment of a board whose members they elect and who possess extensive powers over the marketing activities of the group. The trend after 1936 has been away from producer-controlled regulatory authorities and several acts have provided boards or commissions for particular industries with members appointed by the appropriate minister. The Cotton Industry board, established in 1939, exemplifies this trend and also is significant for its extension of administrative control into a new field.

Administrative regulation has found wider use and been more fully developed in the United States than in England. It was the need for controlling the discriminatory practices and other abuses of the railroads which led, in the United States, as in England, to the first resort to administrative regulation in the modern sense. The Interstate Commerce commission was created in 1887 for this purpose. Reinforced by the Hepburn act of 1906 and subsequent amendments to the Interstate Commerce act, it became the archetype of American regulatory commissions, combining quasi-legislative, quasi-judicial and purely administrative powers. Chief among the commissions which followed in the wake of the Interstate Commerce commission are the Federal Trade commission (1914), the Federal Power commission (1920), the Federal Communications commission (1927, 1934), the Securities and Exchange commission (1934), the National Labor Relations board (1935), the United States Maritime commission (1916, 1936), and the Civil Aeronautics board (1938, 1940). (Where two dates are given the earlier applies to a predecessor agency with a different title ) In some cases broad regulatory powers are given to a department head, as to the secretary of agriculture by the Packers and Stockyards act of 1921 and by the Agricultural Adjustment act of 1938. A similar development has taken place in the states.

Some conception of the powers wielded by these agencies may be had from an enumeration of legislative standards which they apply. These include "reasonable rates," "public convenience and necessity," "unreasonable discrimination," and "unfair labour practices [which] interfere with, restrain, or coerce employes [or] dominate or interfere with any labour organization."

The increasing reliance upon governmental regulation of economic activities, the mounting complexities of those activities themselves and the trend toward substituting prevention for punishment comprise the major causes of the growing use of the administrative method. This method enables the legislature to leave to others the elaboration of detailed regulations for which it has neither the time nor the competence. It also provides expert agencies far better fitted than the courts for the application of regulatory legislation. Without the flexibility of this form of regulation, legislatures would be at a loss to cope with many of the problems confronting them by a dynamic industrialized society.

Like every new form of power, administrative regulation involves its own peculiar dangers and abuses, for which it has been severely criticized. Because of the broad discretion commonly delegated to regulatory authorities, it is complained that a cardinal principle of the "rule of law," that rights and duties should be clearly stated in advance of action by the government, is violated. Discretion also opens the door to arbitrary action The fact that it is common practice to grant these agencies a considerable amount of autonomy leads to the objection that they are undemocratic. Finally, the fact that a single agency makes investigations and findings of fact, brings charges, hears the replies to the charges, and renders decisions, is alleged to violate the principle that the same person should not be both prosecutor and judge—and also, in the United States, the doctrine of the separation of powers.

In practice, adequate safeguards against these abuses have been developed and are generally applied. They include numerous procedural devices, such as, opportunity for hearings, the requirement that all decisions affecting private rights be accompanied by a published statement of reasons, and the separation of the prosecuting and the adjudicating functions within the agencies' staffs. Although administrative agencies are not rigidly bound by precedent, they find it to their own great advantage to develop standards for their guidance and to adhere to consistent policies. Nor are they by any means unchecked from without. On the contrary, they operate within legislative grants of authority, by means of annual appropriations, and frequently are subject to legislatively prescribed procedure. They are also liable to control by the judiciary, at least to the extent that the courts will determine whether they have acted within the authority of and subject to, the restrictions laid down by the legislature, and, in the United States, whether they have complied with the requirements of "due process of law." Finally, they are responsible in varying degrees to the executive branch of the government.

**ADMINISTRATOR:** *see* WILL OR TESTAMENT.

**ADMIRABLE CRICHTON:** *see* CRICHTON, JAMES.

**ADMIRAL,** the rank and title of the naval officer who commands a fleet or subdivision of a fleet. In the United States navy there are four grades of admiral, *i.e.,* admiral of the fleet, admiral, vice-admiral, rear admiral, in descending order of seniority. The first was created, 1899, for Admiral George Dewey. The second and third, corresponding to general and lieutenant general in the army, were created in 1866. In the British navy there are four corresponding grades: admiral of the fleet, admiral, vice-admiral and rear admiral. These titles superseded those of admiral of the blue, red and white.

The rank of admiral essentially applies to flag officers of the military branch who have commanded, or who have qualified to command, a fleet or squadron at sea. In the U.S. navy, certain officers of the nonmilitary branches are given the rank of: rear admiral, medical corps; rear admiral, supply corps; rear admiral, construction corps; rear admiral, civil engineer corps. They are not flag officers

The corresponding ranks in the United States services are:

| NAVY | ARMY |
|---|---|
| Admiral of the fleet | General of the army |
| Admiral | General |
| Vice-admiral | Lieutenant general |
| Rear admiral | Major general |
| Commodore | Brigadier general |

The rank of commodore, after being abandoned for a long period, was re-established in 1943.

The corresponding ranks in the British services are:

| Navy | Army | Air Force |
|---|---|---|
| Admiral of the fleet | Field marshal | Marshal of the royal air force |
| Admiral | General | Air chief marshal |
| Vice-admiral | Lieut general | Air marshal |
| Rear admiral | Major general | Air vice-marshal |

In the United States the ranks of admiral and vice-admiral are temporarily conferred (ex officio) upon the following commanders:

| Admiral | Vice-Admiral |
|---|---|
| Chief of naval operations | Commander scouting force |
| Commander in chief, U S fleet | Commander battleships |
| Commander in chief, Atlantic fleet | Commander aircraft |
| Commander in chief, Pacific fleet | |
| Commander battle force | |

The chiefs of bureau in the U S. navy rank as rear admirals.

It is exceptional for an admiral of the fleet to fly his flag at sea in peacetime. Commanders in chief of the main British fleet and of the premier home ports—Portsmouth and Plymouth—are generally full admirals, and the lesser independent commands and seconds-in-command are vice-admirals or rear admirals. The political and administrative head of the British navy up to the year 1546 was known as the lord high admiral, which office is now executed by the lords commissioners of the admiralty. There still remain the honorary titles of vice- and rear admiral of Great Britain, in compliment to selected senior flag officers. (W. B. Ck.)

**ADMIRALTY.** The department of state that advises the British government and takes the necessary executive action on all questions relating to the interests and territories of the British empire by sea is the admiralty. It is also responsible for building, manning, maintaining and administering the royal navy.

The board of admiralty consists of lords commissioners who were originally appointed by royal letters patent to execute the office of lord high admiral, the powers of which office were statutorily vested in commissioners by the Admiralty act of 1690, although the system whereby responsibility centred in a single high officer—the lord high admiral of the United Kingdom—was virtually terminated in the reign of Henry VIII.

From time to time after that date, the sovereign exercised the royal prerogative to revive the office of lord high admiral, as, for example, when Charles II conferred it on his brother, James, duke of York (afterward James II); but after the reign of Queen Anne only one such appointment was made, that of the duke of Clarence (afterward William IV), who held the office of lord high admiral in 1827–28.

For nearly three centuries before the Admiralty act of 1832, administration of the service was the responsibility of a separate body known as the navy board. The constitution of this board varied, but it was nearly always riddled with political influence and frequently with corruption and inefficiency. Under that act, the board of admiralty was invested with all the powers and duties of the navy board and also of a third organization, the victualling board. Yet another organization, originally instituted specially for the navy, was the ordnance committee, but this passed into military hands and was long a byword for sloth and inefficiency. It became a joint concern in 1881 and, under the title of ordnance board, came to deal with design and trials of ordnance for all three services.

The constitution of the board of admiralty under the act of 1832 provided for superintending lords of the various departments but for no organization for war planning or the conduct of operations, with the result that the system broke down badly when it was put to the test by the Crimean War. Various attempts at reform were made, notably by H. C. E. Childers on becoming first lord in 1868 and then by G. J. Goschen who succeeded him in 1871. But no proper naval staff existed until Winston Churchill was appointed to that office in 1911; even then it was not properly constituted nor given the necessary standing to prevent several naval disasters and the miscarriage of the Dardanelles campaign in the early part of World War I.

As that war developed, it became evident that the departmental lords were too fully occupied with administration and supplies to be able to take an effective part in that joint responsibility for the operational side of the naval war which constitutionally they were expected to do. In the autumn of 1917, after Adm. John R. (later Earl) Jellicoe had become first sea lord, the naval staff system was put on an altogether sounder basis. In effect, there became two separate though closely co-operating bodies within the admiralty, one dealing with the operations and the other with the maintenance of the navy. Although there were modifications in detail, this remained the governing principle in the organization of the admiralty

At mid-20th century the constitution of the board of admiralty, as laid down by Order in Council of May 21, 1947, was as follows:

The first lord; the first sea lord and chief of naval staff, the second sea lord and chief of naval personnel, the third sea lord and controller of the navy; the fourth sea lord and chief of supplies and transport; the fifth sea lord and deputy chief of naval staff (air), the vice-chief of naval staff; the assistant chief of naval staff; the parliamentary and financial secretary; the civil lord; and the permanent secretary.

The first lord is responsible to the king and to parliament for all the business of the admiralty; in the exercise of this over-all responsibility he may assign to the other members of the board such duties and responsibilities as he may think fit. The following is a brief statement of the duties and responsibilities so exercised by other members of the board, subject to the overriding responsibility of the first lord and to the reservation that the first sea lord in his personal capacity remains responsible to parliament for professional advice on naval affairs generally.

The first sea lord is the chief naval professional adviser to the government and the first lord. He is also chief of the naval staff and as such is assisted by the vice-chief of naval staff, the deputy chief of naval staff (air) and the assistant chief of naval staff, who are all members of the board. The naval staff, under the chief of the naval staff and his supporting lords commissioners, is responsible for the formulation of strategical policy, including strategical planning, formulation of tactical doctrine, disposition of the fleet and the statement of the broad requirements both as regards quantities and specifications of H M ships and their fighting equipment

The second sea lord is responsible for the recruitment and entry of officers and men of the royal navy and royal marines and for their training, discipline, welfare, education and the general administration of admiralty establishments connected therewith. He is also responsible for the recruitment, training and administration of the women's royal naval service and naval reserves. The third sea lord is responsible for the construction, equipment and repair of ships and their armaments; for research and development; for the oversight of admiralty establishments connected therewith; and for the supply, distribution and maintenance of all warlike stores. The fourth sea lord is responsible for the provision of naval, victualling and medical stores, and fuel for the fleet, and for the movement of persons and matériel as required for the naval service. He is also concerned with pay, allowances and pensions. The fifth sea lord is responsible for the general direction and co-ordination of policy on all naval air matters. In his capacity as deputy chief of naval staff (air), the fifth sea lord deputizes for the chief and vice-chief of naval staff as necessary.

The parliamentary and financial secretary assists the first lord in his parliamentary duties and in connection with matters relating to the financial policy.

The civil lord assists the first lord in his parliamentary duties and has a general responsibility for works services and for the conditions of service of the admiralty's industrial employees.

The permanent secretary is responsible for general co-ordination of admiralty business on behalf of the board; the interior economy of the admiralty office; the administration of the civil staff; and for navy contracts. As accounting officer for navy votes he is responsible for the control of expenditure and is adviser to the board of admiralty on financial questions. He is responsible for paying, receiving and accounting for all moneys administered by the department.

The only lords who automatically resign when the prime minister resigns are the first lord and the civil lord, both being mem-

bers of parliament.

The naval staff of the admiralty consists essentially of picked naval officers of the rank of commander and above, working under the orders of the chief of naval staff (first sea lord) and his supporting sea lords, with the necessary civilian clerical staff It is responsible for the collection of intelligence; the formulation of strategical policy, including strategical planning, and of tactical doctrine; it states broad requirements as regards numbers and design of H.M ships, their weapons and equipment; it studies the changes in naval warfare consequent on scientific and technical developments; it advises on weapon training and on the priorities to govern the effort to be devoted to the various details of armaments.

An ever increasing amount of attention was devoted by the naval staff during the 20th century to naval aviation in all aspects. Indeed, the air branch became the most important one in the service, and was strongly represented in the admiralty. Numerically, however, the greater part of the admiralty was still devoted to the administration, manning, construction, equipment and supplying of the navy at mid-century. Many of the departments concerned with these matters, under their respective superintending sea lords, had a steady flow of naval officers bringing to them up-to-date practical and professional knowledge of sea-going requirements; others of a less essentially naval character were staffed entirely by civil servants. The admiralty had its own scientists, but it also shared scientific research with the other two service departments through the medium of the ministry of defence.

The most spacious part of the admiralty building in London runs across the north side of the Horse Guards parade; adjoining it is the old building with its beautiful frontage in Whitehall. The latter dates from 1723. An ugly excrescence, popularly known as "Lenin's tomb," was built on at the northwest corner during World War II to provide a bombproof retreat in case of damage to the normal accommodation.

**ADMIRALTY, HIGH COURT OF.** The High Court of Admiralty of England was the court of the deputy or lieutenant of the admiral. It is supposed in the *Black Book of the Admiralty* to have been founded in the reign of Edward I.; but it would appear, from the learned discussion of R. G. Marsden, that it was established as a civil court by Edward III. in the year 1360; the power of the admiral to determine matters of discipline in the fleet, and possibly questions of piracy and prize, being somewhat earlier. At first there were separate admirals or rear-admirals of the north, south and west, each with deputies and courts. A list of them was collected by Sir H. Spelman. These were merged in or absorbed by one high court early in the 15th century. Sir Thomas Beaufort, afterwards earl of Dorset and duke of Exeter (appointed admiral of the fleet 1407, and admiral of England, Ireland and Aquitaine 1412, which latter office he held till his death in 1426), certainly had a court, with a marshal and other officers, and forms of legal process—mandates, warrants, citations, compulsories, proxies, etc. Complaints of encroachment of jurisdiction by the admiralty courts led to the restraining acts, 13 Ric. II. c. 5 (1389), 15 Ric. II. c. 3 (1391) and 2 Hen. IV. c. 11 (1400).

**Jurisdiction.**—The original object of the institution of the courts or court seems to have been to prevent or punish piracy and other crimes upon the narrow seas and to deal with questions of prize; but civil jurisdiction soon followed. The jurisdiction in criminal matters was transferred by the Offences at Sea Act, 1536, to the admiral or his deputy and three or four other substantial persons appointed by the lord chancellor, who were to proceed according to the course of the common law. By the Central Criminal Court Act, 1834, cognizance of crimes committed within the jurisdiction of the admiralty was given to the central criminal court. By an act of 1844 it has been also given to the justices of assize; and crimes done within the jurisdiction of the admiralty are now tried as crimes committed within the body of a county. *See* also the Criminal Law Consolidation Acts of 1861.

From the time of Henry IV. the only legislation affecting the civil jurisdiction of the High Court of Admiralty till the time of Queen Victoria is to be found in an act of 1540, enabling the admiral or his lieutenant to decide on certain complaints of freighters against shipmasters for delay in sailing, and one of 1562, giving the lord [illegible] of England, the lord warden of the Cinque Ports, their lieutenants and judges, co-ordinate power with other judges to enforce forfeitures under that act—a very curious and miscellaneous statute called "An Act for the Maintenance of the Navy."

In an act of 1534, with regard to ecclesiastical appeals from the courts of the archbishops to the Crown, it is provided that the appeal shall be to the king in Chancery, "and that upon every such appeal a commission shall be directed under the great seal to such persons as shall be named by the king's highness, his heirs or successors, like as in cases of appeal from the Admiralty Court." It is only in this incidental recognition that recorded authority for appeals from the admiralty to persons commissioned under the great seal is to be found. The appeal to these "persons," called delegates, continued until it was transferred first to the Privy Council and then to the judicial committee of the Privy Council by acts of 1832 and 1833.

The early jurisdiction of the court appears to have been exercised very much under the same procedure as that used by the courts of common law. Juries are mentioned, sometimes of the county and sometimes of the county and merchants. But the connection with foreign parts led to the gradual introduction of a procedure resembling that coming into use on the Continent and based on the Roman civil law.

**Restraining Acts.**—The material enactments of the restraining statutes were as follows:—An act of 1389 (13 Ric. II. c. 5) provided that "the admirals and their deputies shall not meddle from henceforth of anything done within the realm, but only of a thing done upon the sea, as it hath been used in the time of the noble prince king Edward, grandfather of our lord the king that now is." The Act of 1391 (15 Ric. II. c. 3) provided that "of all manner of contracts, pleas and quarrels, and other things rising within the bodies of the counties as well by land as by water, and also of wreck of the sea, the admiral's court shall have no manner of cognizance, power, nor jurisdiction; but all such manner of contracts, pleas and quarrels, and all other things rising within the bodies of counties, as well by land as by water, as afore, and also wreck of the sea, shall be tried, determined, discussed and remedied by the laws of the land, and not before nor by the admiral, nor his lieutenant in any wise. Nevertheless, of the death of a man, and of a mayhem done in great ships, being and hovering in the main stream of great rivers, only beneath the (bridges) of the same rivers (nigh) to the sea, and in none other places of the same rivers, the admiral shall have cognizance, and also to arrest ships in the great flotes for the great voyages of the king and of the realm; saving always to the king all manner of forfeitures and profits thereof coming; and he shall have also jurisdiction upon the said flotes, during the said voyage only; saving always to the lords, cities, and boroughs, their liberties and franchises." The statutes of Richard, except the enabling part of the second, were repealed by the Civil Procedure Acts Repeal Act, 1879. The formation of a High Court of Justice rendered them obsolete.

In the reign of James I. the chronic controversies between the courts of common law and the admiralty court as to the limits of their respective jurisdictions reached an acute stage. We find the records of it in the second volume of Marsden's *Select Pleas in the Court of Admiralty,* and in Lord Coke's writings: *Reports,* part xiii. 51; *Institutes,* part iv. chap. 22. In this latter passage Lord Coke records how, notwithstanding an agreement asserted to have been made in 1575 between the justices of the King's Bench and the judge of the admiralty, the judges of the common law courts successfully maintained their right to prohibit suits in admiralty upon contracts made on shore, or within havens, or creeks, or tidal rivers, if the waters were within the body of

any county, wheresoever such contracts were broken, for torts committed within the body of a county, whether on land or water, and for contracts made in parts beyond the seas. It is due to the memory of the judges of Lord Coke's time to say that, at any rate as regards contracts made *in partibus transmarinis*, the same rule appears to have been applied at least as early as 1544, the judges then holding that "for actions transitory abroad, action may lie at common law."

**Judge's Patent.**—All the while, however, the patents of the admiralty judge purported to confer on him a far ampler jurisdiction than the jealousy of the other courts would concede to him The patent of the last judge of the court, Sir Robert Joseph Phillimore, dated Aug 23, 1867, styles him "Lieut. Offl Princl and Commissary Genl and Special in our High Court of Admiralty of Eng. and President and Judge of the same," and gives to him power to take cognizance of "all causes, civil and maritime, also all contracts, complaints, offences or suspected offences, crimes, pleas, debts, exchanges, accounts, policies of assurance, loading of ships, and all other matters and contracts which relate to freight due for the use of ships, transportation, money or bottomry; also all suits civil and maritime between merchants or between proprietors of ships and other vessels for matters in, upon, or by the sea, or public streams, or fresh-water ports, rivers, nooks and places overflown whatsoever within the ebbing and flowing of the sea, and high-water mark, or upon any of the shores or banks adjacent from any of the first bridges towards the sea through England and Ireland and the dominions thereof, or elsewhere beyond the seas." Power is also given to hear appeals from vice-admirals; also "to arrest . . . according to the civil laws and ancient customs of our high court . . . all ships, persons, things, goods, wares and merchandise"; also "to enquire by the oaths of honest and lawful men . . . of all . . . things which . . . ought to be enquired after, and to mulct, arrest, punish, chastise, and reform"; also "to preserve the public streams of our admiralty as well for the preservation of our royal navy, and of the fleets and vessels of our kingdom . . . as of whatsoever fishes increasing in the rivers"; also "to reform nets too straight and other unlawful engines and instruments whatsoever for the catching of fishes"; also to take cognizance "of the wreck of the sea . . . and of the death, drowning and view of dead bodies," and the conservation of the statutes concerning wreck of the sea and the office of coroner (1276), and concerning pillages (1353), and "the cognizance of mayhem" within the ebb and flow of the tide; all in as ample manner and form as they were enjoyed by Dr. David Lewis (judge from 1558 to 1584), Sir Julius Caesar, and the other judges in order (22 in all) before Sir Robert Phillimore. This form of patent differs in but few respects from the earlier Latin patents—*tempore* Henry VIII.—except that they have a clause *non obstantibus statutis*.

**Modern Progress.**—As has been said, however, the contention of the common law judges prevailed, and the admiralty court (except for a temporary revival under Cromwell) sank into comparative insignificance during the 17th century. The great maritime wars of the 18th century gave scope to the exercise of its prize jurisdiction; and its international importance as a prize court in the latter half of the 18th and the first part of the 19th centuries is a matter of common historical knowledge. There were upwards of 1,000 prize causes each year between 1803 and 1811, in some years upwards of 2,000.

There were other great judges; but Sir William Scott, afterwards Lord Stowell, is the most famous. Before his time there were no reports of admiralty cases, except Hay and Marriott's prize decisions. But from his time onwards there has been a continuous stream of admiralty reports, and we begin to find important cases decided on the instance as well as on the prize side.

In the reign of Queen Victoria, two enabling statutes, 1840 and 1861, were passed and greatly enlarged the jurisdiction of the court. The manner in which these statutes were administered by Dr. Stephen Lushington and Sir R. J. Phillimore, whose tenure of office covered the whole period of the queen's reign till the creation of the High Court of Justice, the valuable assistance rendered by the nautical assessors from the Trinity House, the great increase of shipping, especially of steam shipping, and the number and gravity of cases of collision, salvage and damage to cargo, restored the activity of the court and made it one of the most important tribunals of the country. In 1875, by the operation of the Judicature Acts of 1873 and 1875, the High Court of Admiralty was with the other great courts of England formed into the High Court of Justice The principal officers of the court in subordination to the judge were the registrar (an office which always points to a connection with canon or civil law), and the marshal, who acted as the maritime sheriff having for his baton of office a silver oar. The assistance of the Trinity Masters which has been already mentioned, was provided for in the charter of incorporation of the Trinity House. These officers and their assistance have been preserved in the High Court of Justice.

**Practitioners in the Court.**—Till the year 1859 the practitioners in the High Court of Admiralty were the same as those in the ecclesiastical courts and distinct from those who practised in the ordinary courts. Advocates took the place of barristers, and proctors of solicitors. The place of the attorney-general was taken by the king's or queen's advocate-general, and that of the treasury solicitor by the king's or queen's procurator or proctor. There were also an admiralty advocate and an admiralty proctor

In an act of 1859 the practice was thrown open to barristers and to attorneys and solicitors.

Upon the next vacancy after the courts were thrown open, the Crown altered the precedence and placed the queen's advocate after the attorney- and solicitor-general. There were two holders of the office under these conditions, Sir R. J. Phillimore and Sir Travers Twiss. The office was not filled up after the resignation of the latter, nor was the office of admiralty advocate filled up when next it became vacant

**Ireland.**—The High Court of Admiralty of Ireland, being formed on the same pattern as the High Court in England, sat in the Four Courts, Dublin, having a judge, a registrar, a marshal and a king's or queen's advocate. In peace time and war time alike it exercised only an instance jurisdiction, though in 1793 it claimed to exercise prize jurisdiction (*see* ADMIRALTY JURISDICTION) No prize commission ever issued to it. By the Irish Judicature Act of 1877 it was directed that it should be amalgamated with the Irish High Court of Justice upon the next vacancy in the office of judge, and this subsequently took place. There was no separate lord high admiral for Ireland.

**Scotland.**—At the Union, while the national functions of the lord high admiral were merged in the English office it was provided by the Act of Union that the Court of Admiralty in Scotland should be continued "for determination of all maritime cases relating to private rights in Scotland competent to the jurisdiction of the Admiralty Court." This court continued till 1831, when its civil jurisdiction was given to the Court of Session and the Sheriffs' Courts (*see* ADMIRALTY JURISDICTION).

*See* J. Godolphin, *View of the Admiral Jurisdiction* (1661); Sir Travers Twiss, *Black Book of the Admiralty*, Rolls' series (1871); R. G. Marsden, *Select Pleas in the Court of Admiralty*, published by the Selden Society (1894). (P.)

**ADMIRALTY ISLANDS,** a group of about 40 islands in the Bismarck archipelago, north of New Guinea, between 1° and 3° S. and 146° and 148° E. The largest of the islands is Manus, sometimes called Great Admiralty island; its principal town is Lorengau, on the northeastern coast of Manus. The estimated native population in 1940 was 13,450 and there were 37 non-native inhabitants. The principal economic activities of the islands are coco-nut plantations (10,457 hectares under cultivation in 1940) and pearl and other shell fisheries. Manus has hills running up to 3,000 ft.; the other islands are mostly low and of coral formation. The Admiralty islands were formerly part of the German protectorate, which also included eastern New Guinea, from 1885 until 1914. They were then occupied by Australian troops and were assigned to Australian administration as part of the League of Nations mandate for eastern New Guinea, which included adjacent islands. They were invaded by the Japanese in Jan. 1942, during the southward sweep that brought them to the northern coast of New Guinea and to the Solomons. The natives are Papuans, with a variety of local dialects, addicted to cannibalism and not hospitable to strangers, although they were tamed to some extent under the man-

datory administration. The islands were discovered by Dutch navigators in 1616 and were visited by Philip Carteret in 1767. The first landing, however, was from the "Challenger" in 1875.

**ADMIRALTY JURISDICTION.** The courts by which, as far as we know, admiralty jurisdiction in civil matters was first exercised were the following. In and throughout England the courts of the several admirals soon combined into one High Court of Admiralty (*see* ADMIRALTY, HIGH COURT OF). Within the territories of the Cinque Ports the Court of Admiralty of the Cinque Ports exercised a co-ordinate jurisdiction In certain towns and places there were local courts of vice-admiralty. In Scotland there existed the Scottish High Court of Admiralty, in Ireland the Irish High Court of Admiralty. Of these courts that of the Cinque Ports alone remains untouched. The Scottish Court was abolished, and its civil jurisdiction given to the Court of Session and to the courts of the sheriffs by the Court of Session Act, 1830—not, however, till a decision given by it and the appeal therefrom to the House of Lords had established a remarkable rule of admiralty law in cases of collision (*Hay* v. *le Neve*, 1824, 2 Shaw, Sc. App. Cas. 395). The act states that the Court of Justiciary held cumulative jurisdiction with the Court of Admiralty in criminal matters. The local vice-admiralty courts in England had ceased to do much work when they were abolished by the Municipal Corporations Act, 1835. The High Court became, with the other superior courts, a component part of the High Court of Justice by virtue of the Judicature Acts, 1873 and 1875 And the Irish Court in like manner became a part of the High Court of Justice in Ireland by virtue of the Judicature Act passed in 1877.

**Vice-Admiralty Courts.**—As England first, and Great Britain afterwards, acquired colonies and possessions beyond seas, vice-admiralty courts were established. The earliest known was that in Jamaica, established in the year 1662. Some vice-admiralty courts created for prize purposes in the eighteenth century were suffered to expire after 1815. In the year 1863, when the act regulating the vice-admiralty courts was passed, there were vice-admiralty courts established in 45 several portions of the King's dominions; to which by an act of 1867 one for the Straits Settlements was added. These courts have been regulated from time to time by the following statutes: 2 and 3 Will. IV. c. 51, 26 and 27 Vict. c. 24 (Vice-Admiralty Courts Act, 1863), already cited, and 30 and 31 Vict. c. 45 (Vice-Admiralty Courts Act Amendment Act, 1867); and by the slave trade acts, of which the last and consolidating act was that of 1873.

In 1890 the Colonial Courts of Admiralty Act provided that, except in the colonies of New South Wales, Victoria, St. Helena and British Honduras, vice-admiralty courts should be abolished and colonial courts of admiralty substituted. There is power, however, reserved to the Crown to erect through the admiralty in any British possession any vice-admiralty court, except in India or any British possession having a representative legislature. No vice-admiralty court so established can exercise any jurisdiction except for some purpose relating to prize, the royal navy, the slave trade, foreign enlistment, Pacific Islanders' protection, and questions relating to treaties or conventions on international law.

**Colonial Courts of Admiralty.**—By the Colonial Courts of Admiralty Act, 1890 already referred to, every court of law in a British possession which is declared by its legislature to be such, or if there be no such declaration, which has original unlimited civil jurisdiction, shall be a court of admiralty.

There used to be vice-admiralty courts for Calcutta, Madras and Bombay; but by the India High Courts Act, 1861, s. 9, the admiralty jurisdiction was given to the High Courts of these places.

**Consular Courts.**—Admiralty jurisdiction was given to the consular courts in China, Japan and Turkey (those in Japan and Turkey have disappeared with the capitulations), and by s. 12 of the Colonial Admiralty Courts Act any court established by H.M. for the exercise of jurisdiction in any place outside H.M.'s dominion may have admiralty jurisdiction granted to it.

**Australia.**—By the Commonwealth of Australia Constitution Act, 1900, a federal supreme court, to be called the High Court of Australia, is created, and the parliament of the Commonwealth may make laws conferring original jurisdiction on the High Court in matters of admiralty and maritime jurisdiction.

**Isle of Man.**—There is a court of admiralty in the Isle of Man of which the water-bailiff is judge. He is also styled admiral It is said to have jurisdiction in salvage and over other maritime matters occurring within three leagues from the shore.

**County and Local Courts.**—Modern statutes have given admiralty jurisdiction to the City of London Court, Court of Passage and to county courts in the following matters. Salvage, where the value of the salved property does not exceed £1,000, or the claim for reward £300; towage, necessaries and wages, where the claim does not exceed £150; claims for damage to cargo, or by collision, up to £300 (and for sums above these prescribed limits by agreement between the parties); and claims arising out of breaches of charter parties and other contracts for carriage of goods in foreign ships, or torts in respect thereof, up to £300 This jurisdiction is restricted to subjects over which jurisdiction was possessed by the High Court of Admiralty at the time when the first of these acts was passed, except as regards the last branch of it (the *Aline*, 1880, 5 Ex. Div. 227; *R* v. *Judge of City of London Court* [1892] 1 Q B. 272). In analogy with the county court admiralty jurisdiction created in England, a limited admiralty jurisdiction was given in Ireland to the recorders of certain boroughs and the chairmen of certain quarter sessions; in salvage cases, where a county court in England would have jurisdiction, magistrates, recorders and chairmen of quarter sessions may have jurisdiction as official arbitrators (Merchant Shipping Act, 1894, s. 547). In Scotland, admiralty suits in cases not exceeding the value of £25 are exclusively tried in the sheriff's court; while over that limit the sheriff's court and the court of session have concurrent jurisdiction. The sheriff has also criminal admiralty jurisdiction, but only as to crimes which he would be competent to try if committed on land (The Court of Session Act, 1830, ss. 21 and 22).

By an act of 1821 an arbitral jurisdiction in cases of salvage was given to certain commissioners of the Cinque Ports.

The appeal from county courts and commissioners is to the High Court of Justice, and is exercised by a divisional court of the Probate, Divorce and Admiralty Division. In cases arising within the Cinque Ports there is an optional appeal to the Admiralty Court of the Cinque Ports The appeal from the High Court of Justice is in ordinary admiralty matters, as in others, to the Court of Appeal and from thence to the House of Lords.

**Civil Jurisdiction.**—In the high courts, whether in England, Scotland or Ireland, it is not now necessary to distinguish their civil admiralty jurisdiction, from their ordinary civil jurisdiction, except for the purpose of seeing whether there can or cannot be process *in rem*. Not that every admiralty action can of right be brought *in rem*, but that no process *in rem* lies at the suit of a subject unless it be for a matter of admiralty jurisdiction—one, for instance, that could in England have been tried in the High Court of Admiralty. Now these matters of admiralty jurisdiction with process *in rem* range themselves under four primary and four supplementary heads. The four primary are damage, salvage, bottomry, wages; and the four supplementary are extensions due to one or other of the statutes of 1840 (Admiralty Court) and 1861 (Admiralty Court Act). They are damage to cargo carried in a ship, necessaries supplied to a ship, mortgage of ship, and master's claim for wages and disbursements on account of a ship. In all these cases, primary and secondary, the process of which a plaintiff can avail himself for redress, may be either *in personam* as in other civil suits, or by arrest of the ship, and, in cases of salvage and bottomry, the cargo. Whenever, also, the ship can be arrested, any freight due can also be attached, by arrest of the cargo to the extent only of the freight which it has to pay. For the purpose of ascertaining whether or not process *in rem* would lie, there have been distinctions as nice, and the line of admiralty jurisdiction has been drawn as carefully, as in the cases of the admiralty jurisdiction of the county courts (the

*Theta,* [1894] P. 280; the *Gas Float Whitton* [1897] App. Cas. 337). Similar questions have been raised in the U.S., from *De Lovio* v. *Boit* (1815, 2 Gall. 398), and *Ramsay* v. *Allegre* (1827, 12 Wheat. 611), down to the more modern cases which are quoted in the arguments and judgments in the *Gas Float Whitton.* The disciplinary jurisdiction once exercised by the Admiralty Court, over the royal navy and merchant vessels, may be said to be obsolete in time of peace, the last remnant of it being suits against merchantmen for flying flags appropriate to men-of-war (the *Minerva,* 1800 3, C. Rob. 34), a matter now more effectively provided against by the Merchant Shipping Act, 1894. In time of war, however, it was exercised in some instances as long as the Admiralty Court lasted, and is now in consequence exercisable by the High Court of Justice (*see* PRIZE COURTS AND PRIZE LAW). It was, perhaps, in consequence of its ancient disciplinary jurisdiction that the Admiralty Court was made the court to enforce certain portions of the Foreign Enlistment Act, 1870.

Finally, appeals from decisions of courts of inquiry, under the Merchant Shipping Act, cancelling or suspending the certificates of officers in the merchant service, may be made to the Probate, Divorce and Admiralty Division of the High Court of Justice.

**Criminal Cases.**—The Admiralty jurisdiction in criminal matters extends over all crimes committed on board British ships at sea or in tidal waters, even though such tidal waters be well within foreign territory (*R.* v. *Anderson,* 1868, L.R. 1 C.C.R. 161), but not over crimes committed on board foreign vessels upon the high seas (*R.* v. *Serva,* 1845, 1 Denison C.C. 104). Whether it extended over crimes committed on foreign ships within territorial waters of the United Kingdom, and whether a zone of three miles round the shores of the United Kingdom was for such purpose territorial water, were the great questions raised in *R.* v. *Keyn* (the *Franconia,* L.R. 2 Ex. Div. 126), and decided in the negative by the majority of the judges. Since then, however, the legislature has brought these waters within the jurisdiction of the admiralty by the Territorial Waters Jurisdiction Act, 1878. Section 2 runs as follows: "An offence committed by a person, whether he is or is not a British subject, on the open sea within the territorial waters of British dominions, is an offence within the jurisdiction of the admiral, although it may have been committed on board or by means of a foreign ship." By s. 7 the "jurisdiction of the admiral" is defined as "including the jurisdiction of the admiralty of England or Ireland, or either of such jurisdictions as used in any act of parliament" (*see* WATERS, TERRITORIAL).

Where portions of the sea and tidal waters, by reason of their partially land-locked positions are deemed to be in the body of a county, there is no [illegible] jurisdiction. Crimes are tried as if they were committed on land within the same county.

Pirates, whatever flag they pretended to fly, were, from 1360, wherever their crimes were committed, subject to admiralty jurisdiction. The criminal jurisdiction of the admiralty was first exercised by the High Court of Admiralty; and then, by the Offences at Sea Act, 1536, transferred to commissioners appointed under the great seal, among whom were to be the admiral or admirals, his or their deputies. Admiralty sessions were held for this purpose till 1834. Admiralty criminal jurisdiction is now, by virtue of the series of statutes, the Offences at Sea Act, 1799, the Central Criminal Court Act, 1834, Offences at Sea Act, 1844, and the criminal law consolidation acts passed in 1861, exercised by the Central Criminal Court and by the ordinary courts of assize. Special provision for trial in the colonies of offences committed at sea was made by William III (1698–99), in the Offences at Sea Act, 1806, and the Admiralty Offences (Colonial) Act, 1849. (P.)

### UNITED STATES

Admiralty jurisdiction was exercised in the American colonies by vice-admiralty courts until the year 1776, then by the State admiralty courts until 1789. The Constitution, Art. III., s. 2, provides that the judicial power of the United States "shall extend to all cases of admiralty and maritime jurisdiction"

The Judiciary Act of 1789 (1 U.S.S.L. 76) granted original jurisdiction to United States district courts. The circuit courts were given concurrent original jurisdiction over seizures for slave trading, condemnations of property used by persons in insurrection (R.S. 629, 2nd ed.), and in the coolie trade (R.S.2159, 2nd ed.). The supreme court of the District of Columbia was given the same jurisdiction as that of the United States district courts in 1901 (31 U.S.S.L. 1199). Formerly the Judiciary Act authorized appeals from the district court to the circuit court and thence to the Supreme Court. This practice was abolished in 1891, and nine circuit courts of appeals were created (Judicial Code, s. 116). These were the final courts of appeal in admiralty, except that there was the right of a direct appeal to the Supreme Court on questions of jurisdiction (Judicial Code, s. 238), and that the Supreme Court might in its discretion review the judgments of the circuit court of appeals by writs of certiorari (Judicial Code, s. 240).

The circuit courts were abolished in 1911 (Judicial Code, s. 289) Direct appeals to the Supreme Court were abolished in 1925 (43 U.S.S.L. 938). Since then the district courts alone have original jurisdiction in all admiralty cases. Appeals lie to the circuit courts of appeal which may certify questions to the Supreme Court for opinion, and the Supreme Court may review the judgments of the circuit courts of appeal on writs of certiorari.

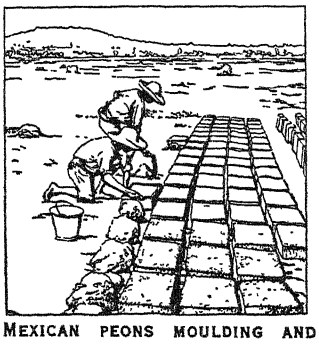
The district courts have jurisdiction in admiralty of suits against the United States in contract and in tort arising out of the operation of merchant vessels (41 U.S.S.L. 525), in tort, towage and salvage arising out of the operation of public vessels (43 U.S.S.L. 1112), and in certain cases concurrent jurisdiction with the court of claims in contract cases (24 U.S.S.L. 505; *Cornell S. S. Co.* v. *U.S.,* 202 U.S. 184). The district courts have jurisdiction over crimes and offences committed upon vessels of the United States wherever they may be afloat upon navigable waters, but they are tried according to common law criminal procedure (*U.S.* v. *Rodgers,* 150 U.S. 249; *Hamilton* v. *U.S.,* 268 Fed. 15).

**Actions in admiralty** may be either *in rem* with the arrest of the ship, or other maritime property, to enforce a maritime lien (a *jus in re*) or *in personam* against a person. Actions *in rem* are limited to courts of admiralty. Under s. 24 of the Judicial Code, "saving to suitors the right of a common law remedy where the common law is competent to give it," a right *in personam* may be enforced in a common law court, but the substantive rights of the parties are determined by the maritime law (*Southern Pacific* v. *Jensen,* 244 U.S. 205; *Knickerbocker Ice Co.* v. *Stewart,* 253 U.S. 149). Admiralty jurisdiction extends to all navigable waters, including rivers, lakes and canals connected with the sea (*The Hine,* 4 Wall, 555; *Robert W. Parson,* 191 U.S. 17). Admiralty jurisdiction extends to prize cases (*Jecker* v. *Montgomery,* 13 How. 498), to possessory and petitory suits (*The Schooner Tilton,* Fed. Cas. No. 14054; *Ward* v. *Peck,* 18 How. 267), to maritime contracts and torts. Maritime contracts are determined by their subject matter and in general they relate to ships as such, or to transportation of goods or passengers. They include charter-parties, contracts of affreightment, bills of lading, bottomry and respondentia bonds, salvage, towage, pilotage, stevedoring, supplies and repairs, advances, marine insurance policies, wages, preferred mortgages (41 U.S.S.L. 988, 1000; *ex parte Easton,* 95 U.S. 68). A contract to build a ship or furnish material for its completion is non-maritime (*Peoples Ferry Co.* v. *Beers,* 20 How. 393; *the Thames Co.* v. *Francis McDonald,* 254 U.S. 242). A tort is maritime if the injury is inflicted on navigable waters (*Atlantic Transport Co.* v. *Imbrovek,* 234 U.S. 52). If a vessel collides with a pier the damage to the pier is a non-maritime tort because the injury occurs on land (*Cleveland Terminal & Valley R.R. Co.* v. *Cleveland S.S. Co.,* 208 U.S. 316), but the damage to the vessel is a maritime tort because that injury occurs on navigable waters (*P.W. & B.R.R. Co.* v. *Phila. etc. S.S. Co.,* 23 How. 209; *Hill* v. *Board of Freeholders,* 45 Fed. 260). (A. M. B.)

**ADMISSION:** *see* EVIDENCE, also ESTOPPEL.

**ADMITTANCE**, in alternating current electricity, the reciprocal of the reactance. (*See* ELECTRICITY.)

**ADO** (d. 874), archbishop of Vienne in Lotharingia, belonged to a famous Frankish house, and spent much of his middle life in Italy. He held his archiepiscopal see from 859 until his death on Dec. 16, 874. Several of his letters are extant and reveal their writer as an energetic man of wide sympathies and considerable influence.



Ado's principal works are a *Martyrologium* (printed *inter al* in Migne, *Patrolog lat.*, cxxiii, pp. 181–420; append., pp. 419–436), and chronicle, *Chronicon sive Breviarium chronicorum de sex mundi aetatibus de Adamo usque ad ann. 869* (in Migne, cxxiii, pp. 20–138 and Pertz, *Monumenta Germ*, ii, pp. 315–323, etc).

Ado's chronicle is based on that of Bede, with which he combines extracts from the ordinary sources, forming the whole into a consecutive narrative founded on the conception of the unity of the Roman empire, which he traces in the succession of the emperors, Charlemagne and his heirs following immediately after Constantine and Irene. "It is," says Wattenbach, "history from the point of view of authority and preconceived opinion, which exclude any independent judgment of events"

Ado also wrote a book on the miracles (*Miracula*) of St Bernard, archbishop of Vienne (9th century), published in the Bollandist *Acta Sanctorum;* a life or *Martyrium* of St. Desiderius, bishop of Vienne (d. 608), written about 870 and published in Migne, cxxiii, pp. 435–442; and a life of St. Theudericus, abbot of Vienne (563), published in Mabillon, *Acta Sanct.*, i, pp. 678–681, Migne, cxxiii, pp 443–450, and revised in Bollandist *Acta Sanct.*, xii, pp. 840–843.

*See* W. Wattenbach, *Deutschlands Geschichtsquellen,* vol. i (Stuttgart, 1904).

**ADOBE** (ą-dō′bę), a Spanish-American word (often corrupted to *dobie*) for the sun-dried clay used for building by the Indians in the arid regions of the southwestern United States and northern Mexico (from Spanish *adobar,* to plaster). The use of such building material is said to have been anciently introduced into Spain from northern Africa. Soon after the discovery of America the method was imported into Peru, Mexico and other dry countries of the new world by the Spanish conquerors, who brought it as early as the 16th century to the Indians of New Mexico and Arizona. Most of the buildings connected with the Spanish missions in California, established in 1770–1823, were constructed of adobe. In Mexico and the southwestern United States the name is not only applied to the bricks but also to the clay from which they are made, and, likewise, to structures built of this material. The usual method of making adobe is very simple. It consists of wetting a quantity of suitable clay, adding a small amount of chopped straw, hay, grass roots or other fibrous litter, mixing the materials with a hoe or a similar implement, and then trampling the mass with the bare feet. When brought to the proper consistency, the adobe is shaped with simple wooden moulds into bricks. These vary greatly in size, in accordance with intended use, ranging from small forms about 8 in. square and 2 in. thick to large slabs 1 or 2 yd. long, 1 ft. wide and 6 to 8 in. thick. A common form for structural use is about 12 in. wide, 16 in. long and from 4 to 8 in. thick. After being properly dried, adobes are laid in walls, like ordinary bricks, and joined with a mortar of the same material. Often the walls are smoothly finished inside and out with this mortar and given an outer coating of lime wash, which is frequently tinted with yellow or other colours.

MEXICAN PEONS MOULDING AND DRYING ADOBE, A COMMON BUILDING MATERIAL IN ARID PARTS OF MEXICO AND THE SOUTHWEST U.S.

In regions of scant rainfall adobe is serviceable in structures of one story, or other low buildings, having well-drained foundations and nonleaking roofs with wide cornices and eaves. When protected against the action of water, adobe walls will endure for many decades and sometimes for centuries. As adobe is a very poor conductor of heat and as walls made of it do not become frosty in cold weather or damp in a short rainy season, adobe structures are warm in winter and cool in summer, the interior temperature of the walls remaining remarkably constant. After 1900 there was a revival of adobe construction in the southwestern United States, particularly in California. In a modified form adobe is utilized also in Colorado and other states of the Rocky Mountain plateau, where, instead of being first made into bricks, the adobe is moulded directly into the wall, being applied and dried in successive layers.

In the plateau region adobe is used chiefly for walls of stables cattle sheds and chicken houses. In southern California substantial city homes have been constructed with adobe walls, made from materials available on the premises, and finished with waterproof plaster or stucco, thus making it possible, when so desired, to dispense with the wide cornices and eaves otherwise required in adobe structures.

Scientific researches have shown that seeds that have been embedded with the barnyard refuse used in making adobe are preserved indefinitely. Consequently, by dissolving out seeds contained in adobes from the walls of old buildings whose date of erection is known, the approximate date of introduction of various cultivated plants in the region may be ascertained.

Bull 174* (1910); Lee McCrae, "The Revival of the Adobe," *Keith's Magazine,* xlv, p. 45–47 (1921); Torrey Connor, "The Art and Uses of Adobe," *House Beautiful,* li, p 78–79 (1922); and Roy M. Singer, "Adobe House Construction," *National Builder,* lxvii, pp. 74–76 (1924).

**ADOBE SOIL,** a term used in the western United States, particularly in California, to designate the structural quality of various clay soils, referring usually to the characteristic breakage of such soil material into small angular blocks when it dries These soils are very heavy in texture, being composed of extremely fine-grained material, a large part of which is colloidal. Sands and loose sandy loams, for example, never display an adobe soil structure.

By many, however, adobe soils are thought of as constituting the material from which adobe or sun-dried bricks are made; but, as in the case of ordinary brick, adobe building materials are derived from a great variety of clayey soils. Under proper conditions of moisture soils of adobe structure are readily worked, but when too dry their hardness and coherence make tillage extremely difficult. When placed under irrigation, soils of this type usually display great fertility.

**ADOLESCENCE,** the period of human development between childhood and maturity For the psychological aspects of adolescence, *see* PSYCHOLOGY, especially the sections *Clinical Psychology* and *Educational Psychology. See* also SECONDARY EDUCATION, for the relation between adolescence and education, and AGE, for the legal aspects of this period, particularly in relation to rights and responsibilities.

**ADOLPH OF NASSAU** (*c.* 1255–1298), German king, son of Walram, count of Nassau. He appears to have received a good education, and inherited his father's lands around Wiesbaden in 1276.

Adolph won considerable fame as a mercenary in many of the feuds of the time, and on May 5, 1292, was chosen German king, in succession to Rudolph I, an election which was due rather to the political conditions of the time than to his personal qualities. He made large promises to his supporters, and was crowned on July 1 at Aix-la-Chapelle. Princes and towns did homage to him, but his position was unstable, and the allegiance of many of the princes, among them Albert I, duke of Austria, son of the former king Rudolph, was merely nominal.

Seeking at once to strengthen the royal position, he claimed Meissen as a vacant fief of the empire, and in 1294 allied himself with Edward I, king of England, against France. Edward granted him a subsidy, but because of a variety of reasons Adolph did not take the field against France, but turned his arms against Thuringia, which he had purchased from the landgrave Albert II.

This bargain was resisted by the sons of Albert, and from 1294 to 1296 Adolph was campaigning in Meissen and Thuringia, and his relations with Albert of Austria were becoming more strained

He had been unable to fulfil the promises made at his election, and the princes began to look with suspicion upon his designs. Wenceslaus II, king of Bohemia, fell away from his allegiance, and his deposition was decided on, and was carried out at Mainz, on May 23, 1298, when Albert of Austria was elected his successor. The forces of the rival kings met at Göllheim on July 2, 1298, where Adolph was killed, it is said by the hand of Albert. He was buried at Rosenthal, and in 1309 his remains were removed to Spires.

Gebhardt, *Handbuch der deutschen Geschichte,* Band 1 (Berlin, 1901)

**ADOLPHUS, JOHN LEYCESTER** (1795–1862), English lawyer and author, was the son of John Adolphus (1768–1845), a well-known London barrister who wrote a *History of England to 1783* (1802), a *History of France from 1790* (1803) and other works. He was educated at Merchant Taylors' school and at St. John's college, Oxford

In 1821 he published *Letters to Richard Heber, Esq.,* in which he discussed the authorship of the then anonymous Waverley novels, and fixed it upon Sir Walter Scott. This conclusion was based on the resemblance of the novels in general style and method to the poems acknowledged by Scott. Scott thought at first that the letters were written by Reginald Heber, afterward bishop of Calcutta, and the discovery of J. L Adolphus' identity led to a warm friendship. Adolphus was called to the bar in 1822, and his *Circuiteers, an Eclogue,* is a parody of the style of two of his colleagues on the northern circuit.

He became judge of the Marylebone County court in 1852, and was a bencher of the Inner Temple He was the author of *Letters from Spain in 1856 and 1857* (1858), and at the time of his death on Dec. 24, 1862, was engaged in completing his father's *History of England,* a book still valuable for the history of the first part of the reign of George III.

**ADOLPHUS FREDERICK** (1710–1771), king of Sweden, was born at Gottorp on May 14, 1710. His father was Christian Augustus (1673–1726), duke of Schleswig-Holstein-Gottorp, bishop of Lübeck, and administrator, during the war of 1700–21, of the duchies of Holstein-Gottorp for his nephew Charles Frederick; his mother was Albertina Frederica of Baden-Durlach. From 1727 to 1750 he was bishop of Lübeck, and administrator of Holstein-Kiel during the minority of Duke Charles Peter Ulrich, afterward Peter III of Russia.

In 1743 he was elected heir to the throne of Sweden by the "Hat" faction in order that they might obtain better conditions of peace from the empress Elizabeth, whose fondness for the house of Holstein was notorious.

During his whole reign (1751–71) Adolphus Frederick was little more than a state decoration, the real power being lodged in the hands of an omnipotent *riksdag,* distracted by fierce party strife. Twice he endeavoured to free himself from the intolerable tutelage of the estates.

The first occasion was in 1756 when, stimulated by his imperious consort Louisa Ulrica, sister of Frederick the Great, he tried to regain a portion of the attenuated prerogative, and nearly lost his throne in consequence. On the second occasion, under the guidance of his eldest son, the crown prince Gustavus, afterward Gustavus III, he succeeded in overthrowing the tyrannous "Cap" senate, but was unable to make any use of his victory. He died at Stockholm on Feb. 12, 1771.

*See* R. Nisbet Bain, *Gustavus III and his Contemporaries,* vol. i (London, 1895).

**ADONI,** a town of former British India, in the Bellary district of Madras, 307 mi. from Madras by rail. Pop. (1941) 35,431. It has manufactures of carpets, silk and cotton goods, factories for ginning and pressing cotton and a considerable trade in cotton. The hill fort above, now in ruins, was a seat of government frequently mentioned in 18th-century wars.

**ADONIJAH** (Heb. *Adoniyyah* or *Adoniyyahu,* "Yah is Lord"), a name borne by several persons in the Old Testament, of whom the most noteworthy was the fourth son of David. He was born to Haggith at Hebron (II Sam iii, 4; I Ch. iii, 2) Adonijah was the natural heir to the throne. On the death of Absalom, and shortly before the death of David, he made preparations to seize his birthright, in which he received the support of Joab and Abiathar the priest; he also made arrangements for his coronation (I Kings i, 5 *et seq* ).

However, Bathsheba, David's favourite wife, organized a counterintrigue in favour of her son Solomon. With the help of Bathsheba and of Nathan the prophet, and apparently with the consent of David, Solomon ascended the throne. Hearing this, Adonijah fled for safety to the horns of the altar Solomon spared him on this occasion (I Kings i, 50 *et seq* ), but later he commanded Benaiah to slay Adonijah ( ii, 13 *et seq* ) on the ground that he wished, with the approval of Bathsheba, to marry David's former concubine, Abishag, and thus seemed to be aiming at the crown (I Kings i, *et seq.*).

**ADONIS,** in classical mythology, a youth of remarkable beauty, the favourite of Aphrodite. According to the story in Apollodorus (iii, 14, 4), he was the son of the Syrian king Theias by his daughter Smyrna (Myrrha), who had been inspired by Aphrodite with unnatural love. When Theias discovered the truth he would have slain his daughter, but the gods in pity changed her into a tree of the same name. After ten months the tree burst asunder and from it came forth Adonis. Aphrodite, charmed by his beauty, hid the infant in a box and handed him over to the care of Persephone, who afterward refused to give him up. On an appeal being made to Zeus, he decided that Adonis should spend a third of the year with Persephone and a third with Aphrodite, the remaining third being at his own disposal.

There are many variations in the later forms of the story, notably the version given by Ovid (*Metam.,* x, 298) which is also the one used by Shakespeare. In this version, Adonis was killed by a boar. Apollodorus (iii, 185) clumsily combines the two The name is generally supposed to be of Phoenician origin (from *adon,* "lord"), Adonis himself being identified with Tammuz (but *see* F. Dummler in Pauly-Wissowa's *Real-encyklopädie,* who does not admit a Semitic origin for either name or cult). The name Abobas, by which he was known at Perga in Pamphylia, certainly seems connected with *abub* (a Semitic word for "flute"; *cf* "ambubaiarum collegia" in Horace, *Satires,* i, 2, I). (*See* also ATTIS.)

Annual festivals, called Adonia, were held in his honour at Byblus, and also, from the 5th century B.C. onward, at different places in Greece. Although there were variations in the ceremony itself and in its date, the central idea was the death and resurrection of Adonis, mourning for Adonis who was generally represented by an effigy which was afterward thrown into the water. A vivid description of the very elaborate festival at Alexandria (for which Bion probably wrote his *Dirge of Adonis*) is given by Theocritus in his 15th idyll, the *Adoniazusae.* On the first day, which celebrated the union of Adonis and Aphrodite, their images were placed side by side on a silver couch, around them all the fruits of the season, "Adonis gardens" in silver baskets, golden boxes of myrrh, cakes of meal, honey and oil, made in the likeness of things that creep and things that fly. On the day following, the image of Adonis was carried down to the shore and cast into the sea by women with dishevelled hair and bared breasts. At the same time a song was sung, in which the god was entreated to be propitious in the coming year.

This festival, like that at Athens, was held late in summer; at Byblus, where the mourning ceremony preceded, it took place in spring.

It later became generally agreed by most authorities that Adonis represents a vegetation spirit, whose death and later return to life represent the decay of nature in winter and its revival in spring. He is born from the myrrh tree, the oil of which is used at his festival. He is connected with Aphrodite in her character of vegetation goddess. A special feature of the Athenian festival was the "Adonis gardens," small pots of seeds forced

to grow artificially, which rapidly faded. The dispute between Aphrodite and Persephone for the possession of Adonis finds a parallel in the story of Tammuz and Ishtar (*see* APHRODITE). In other words, Aphrodite is the Oriental mother-goddess, Adonis her lover; the details have been influenced by the legend of Demeter (*q.v.*). The ceremony of the Adonia was intended as a charm to promote the growth of vegetation, the throwing of the gardens and images into the water being supposed to procure a supply of rain (for European parallels *see* Mannhardt). It is suggested (Frazer) that Adonis is not a god of vegetation generally, but specially a corn-spirit, and that the lamentation is not for the decay of vegetation in winter, but for the cruel treatment of the corn by the reaper and miller (*cf.* Robert Burns's *John Barleycorn*).

ADONIS, A YOUTH IN CLASSICAL MYTHOLOGY, BELOVED BY APHRODITE FOR HIS GREAT BEAUTY

An important element in the story is the connection of Adonis with the boar; possibly Adonis himself was looked upon as incarnate in the swine. For a god sacrificed to himself as his own enemy, *cf.* the sacrifice of the goat and bull to Dionysus. It has been observed that whenever sacrifices of swine occur in the ritual of Aphrodite there is reference to Adonis. In any case, the conception of Adonis as a swine-god does not contradict the idea of him as a vegetation or corn spirit, which in many parts of Europe appears in the form of a boar or sow.

Frazer, *The Golden Bough*, vol. [illegible], *Cults of the Greek States*, II, p 646; W. R. Smith, *Religion of the Semites*, new ed., 1894, pp 191, 290, 411.

**ADONIS,** a genus of plants of the crowfoot family (Ranunculaceae, *q.v.*) known as pheasant's eye and *Flos Adonis*. They comprise about 20 Eurasian species, cultivated for ornament. They are erect herbs with much-divided leaves and yellow or red flowers. *Adonis vernalis* is a perennial, but *A. aestivalis* and *A. annua* are annuals, the latter sometimes naturalized. The name is also given to the Adonis Blue butterfly (*Lysandra bellargus*), occurring in the chalk downs of southern England.

**ADOPTION** is the act of a person taking upon himself the position of parent to another who is not in fact or is not treated by law as his child, and the person so acting is recognized by the law as having the rights and duties of a parent by nature. The practice prevailed in most civilized or semicivilized nations from the earliest times. In India it is general, based on customs or religious and social ideas which vary in different parts of the country and among different classes. "The probability is that any Hindu who has no son will contemplate adoption," and the effect that every adoption must have on the devolution of property causes endless disputes, so that the courts, including the privy council on appeals from Indian tribunals, are constantly occupied with the litigation of this subject. An elaborate statement with regard to the Indian laws affecting adoption will be found in Z. Mayne's *Commentaries*.

Adoption was also common among the Greeks and Romans. The Roman law was well defined and clearly stated by the jurists and, in this as well as in other subjects, had an important influence on the law of most modern European countries except England. Important changes were made from time to time, but it is to be noticed that from the earliest to the latest times some intervention on the part of the state and official sanction was required to give legal effect to adoptions. This principle has been generally accepted in the legislation and practice of modern states and is also the basis of the recent change in English law.

By the French code conditions are laid down under which adoption may take place. To give legal effect to it, enquiry must be made by the court (1) whether the conditions have been fulfilled, (2) whether the adopter is of good repute. The act of adoption must be published and registered The adopted person preserves his rights in his natural family of origin and gains no rights of inheritance as regards the property of the relatives of the adopter, but in the property of the adopter himself has the same rights as a legitimate child. According to the French code, the adoptive parent must be 50 years of age, and on the other hand it is provided that *l'adoption ne pourra en aucun cas avoir lieu avant la majorité de l'adopté.* A subsequent part of the code deals with the appointment of *tuteurs officieux* for protection of the interests of persons who require such oversight or assistance.

In Germany adoption is recognized and plays a most important part in the social life and conditions of the German people. It is regulated by a number of elaborate and carefully drawn provisions which are contained in the civil code. A comprehensive statement of these provisions will be found in an article by Henry Happold, of Berlin, which appeared in the *Law Magazine and Review* for Aug. 1914. It shows how complicated the question is and how many points have to be provided for. As in the French code, confirmation by a competent tribunal is necessary to give legal validity to an adoption. It is also to be noted that though the adopted child acquires the legal position of a legitimate child of the adopter, the adopter acquires no right of inheritance, and the person adopted acquires no rights as regards the relatives of the adopter

Adoption is also provided for in the legislation of the British dominions In West Australia, for example, a male may be adopted by a man 18 years his senior, or by a woman 30 years his senior, or a female by a woman 18 years her senior or a man 30 years her senior. An act on the subject has also been passed in South Africa.

In view of this widespread recognition of adoption by law both in ancient and modern states all over the world it seems strange that until 1926 "adoption" in the sense of the transfer of parental rights and duties in respect of a child to another person and their assumption by him was not recognized by the law of England (*see* Halsbury's *Commentaries*). But a relative or a stranger might put himself *in loco parentis* to a child, and certain legal consequences between the parties might result from that position Where a parent has neglected a child or it would be injurious to the child to remain in his custody, he could be deprived of it or of the direction of the child's education or of the right to decide in what religion it shall be brought up (*re Newton*, 1896, 1 ch., 748). Under the Children act, 1908, and other statutes the guardianship of children may be taken from parents who have ill-treated and neglected them and entrusted to some other person or institution, but this is not properly a case of adoption.

By the British Adoption of Children act, 1926, for the first time a definite system of legal adoption is introduced. Under that act on application made by a person desirous of being authorized to adopt an infant, the court may make an order authorizing the applicant to adopt that infant. In this procedure English law follows the precedent of Roman law and of most other countries, including the dominions, in requiring the sanction of a judicial or public authority for adoption of children. The welfare of the child is to be the paramount consideration. No payment or reward is to be received by the adoptive parent unless sanctioned by the court for some special reason. The adopted child does not lose rights of succession to the property of the natural parent or gain rights of succession to the adopter, but all rights and duties of parents or guardians as to future custody, maintenance and education are to vest in and be exercisable by and enforceable against the adopter as though the adopted child was born to the adopter in lawful wedlock. The applicant must not be under 25 years of age, must as a rule be 21 years older than the person adopted, and the court must see that the consent of the proper parties has been obtained. Either the high court, the county courts or courts of summary jurisdiction may deal with

applications for adoption, and the effect of the order is registered

Already the act has been used in a very large number of cases, and it is constantly found that between the adoptive parents and the children adopted ties of affection grow up very similar to those which exist between parents and their own children.

In the United States, Louisiana and Texas follow the civil law in relation to adoption, but the other states, where their jurisprudence is based on the common law, have had to enact statutes concerning the same. In many states it is required that adoptions be made only by married couples, but in a few states a single person may do so. Suitable age, financial solvency and substantial compliance with the requirements of the statutes are essential to make adoptions legal. Some states permit adoptions only of minors, and others forbid adoptions of relatives. An adopted child stands in the position of a child by blood in the matter of inheritances if the adoptive parent dies intestate.

*See* W. Clarke Hall, *Law of Adoption and Guardianship of Infants* (1928). (A. H)

**ADOPTIONISM.** As the theological doctrine of the Logos which bulks so largely in the writings of the apologists of the 2nd century came to the front, the trinitarian problem became acute. The necessity of a constant protest against polytheism led to a tenacious insistence on the divine unity, and the task was to reconcile this unity with the deity of Jesus Christ. Some thinkers fell back on the "modalistic" solution which regards "Father" and "Son" as two aspects of the same divine principle; but the "adoptionist" or humanitarian method was a simpler and more popular one. Basing their views on the synoptic Gospels the adoptionists under Theodotus of Byzantium tried to found a school at Rome *c.* 185, asserting that Jesus was a man, imbued with the Holy Spirit's inspiration from his baptism, and so attaining such a perfection of holiness that he was adopted by God and exalted to divine dignity. Theodotus was excommunicated by the bishop of Rome, Victor, *c.* 195, but his followers lived on under a younger teacher, Artemon, while in the east similar views were expounded by Beryllus of Bostra and Paul of Samosata, who undoubtedly influenced Lucian of Antioch and his school, including Arius and, later, Nestorius.

There is thus a traceable historical connection between the early adoption controversy and the struggle in Spain at the end of the 8th century, to which that name is usually given. It was indeed only a renewal, under new conditions, of the conflict between two types of thought, the rational and the mystical, the school of Antioch and that of Alexandria. The writings of Theodore of Mopsuestia, a typical representative of the Antiochene school, had become well known in the west, and the opposition of Islam also partly determined the form of men's views on the doctrine of Christ's person. About 780 Elipandus (born 718), archbishop of Toledo, revived and vehemently defended the expression, *Christus Filius Dei adoptivus* (Christ the adopted son of God), and was aided by his much more gifted friend Felix, bishop of Urgella. They held that the duality of natures implied a distinction between two modes of sonship in Christ—the natural or proper, and the adoptive. In support of their views they appealed to scripture, and especially to Christ's fraternal relation to Christians—the brother of God's adopted sons. Christ, the firstborn among many brethren, had a natural birth at Bethlehem and also a spiritual birth begun at his baptism and consummated at his resurrection. Thus they did not teach a dual *personality*, nor the old Antiochene view that Christ's divine exaltation was due to his sinless virtue; they were less concerned with old disputes than with the problem as the Chalcedon decision had left it—the relation of Christ's one personality to his two natures.

Felix introduced adoption views into that part of Spain which belong to the Franks, and Charlemagne thought it necessary to assemble a synod at Regensburg (Ratisbon) in 792, before which the bishop was summoned to explain and justify the new doctrine. He renounced it and confirmed his renunciation by a solemn oath to Pope Adrian, to whom the synod sent him. The recantation was probably insincere, for on returning to his diocese he taught adoptionism as before. Another synod was held at Frankfurt in 794, by which the new doctrine was again formally condemned, though neither Felix nor any of his followers appeared.

In this synod Alcuin of York took part. A friendly letter from Alcuin, and a controversial pamphlet, to which Felix replied, were followed by the sending of several commissions of clergy to Spain to endeavour to put down the heresy. Archbishop Leidrad (died 816) of Lyons, being on one of these commissions, persuaded Felix to appear before a synod at Aix-la-Chapelle in 799. There, after six days' disputing with Alcuin, he again recanted his heresy. The rest of his life was spent under the supervision of the Archbishop at Lyons, where he died in 816. Elipandus, secure in his see at Toledo, never swerved from the adoption views, which, however, were almost universally abandoned after the two leaders died. Adoptionism continued to be a source of theological dispute all through the middle ages, but was no longer put forward as a serious interpretation of the person of Christ.

**ADOR, GUSTAVE** (1845–1928), Swiss statesman, was born at Geneva, Dec. 23, 1845, of a Vaudois family established there in 1814. He studied law at the academy and in 1868 became an advocate. He served his apprenticeship to politics in the cantonal government and was president of the cantonal executive in 1892 and 1906. From 1889 to 1917 he was a member of the Swiss National council, of which he was president in 1901.

Ador gained an international reputation for the hard and disinterested work he did for the International Red Cross. He had become president of the committee four years before World War I, and when it broke out he founded an association at Geneva for facilitating communications between prisoners of war and their families and for alleviating their condition. A central agency for forwarding parcels and letters was established.

In June 1917, after the enforced resignation of Arthur Hoffmann, Ador became a member of the executive of the Swiss federation with the portfolio of foreign affairs. Toward the end of 1918 he was elected president of the Swiss federation; he retired at the end of his year of office. He headed the Swiss delegation which visited Paris and London in Jan.-Feb. 1920 to secure a reservation of the principle of the neutrality of Switzerland when she joined the League of Nations. He did important work for the League itself, first as president of the Brussels Conference of 1920 and then as president of the Economic and Financial commission. He represented Switzerland at the various assemblies of the League of Nations until 1924, when he retired on the ground of advancing age, although he still continued his Red Cross work. He died at Geneva on March 31, 1928. His funeral was a national ceremony, and was held in Geneva cathedral.

**ADORATION,** from the phrase (*manum*) *ad os* (*mittere*) which designated the Roman's act of kissing the hand to the statue of the god he wished to honour, has come to denote the act whereby man acknowledges God's supreme perfection and dominion. Such actions are principally sacrifice and the prayer of praise which of their very nature are restricted to the adoration of God. The Greek Christians distinguished carefully between λατρεία, the worship of God, and προσκύνησις, the veneration given to other sacred persons or objects. Both Greek words were translated into Latin by the one word *adoratio*, and as a result the distinction of concepts was at times obscured. In English this confusion has been avoided by the more common use of *veneration* to designate the reverence paid to Saints and images or relics of Saints. Roman Catholics add a further distinction between such veneration as paid to the Blessed Virgin because of her singular pre-eminence (*hyperdulia*) and as paid to Saints and sacred objects (*dulia*). By a natural transition *adoration* has also been applied to the homage rendered to monarchs by the ceremony of striking the earth with the forehead.

**ADORF,** a town in the *Land* of Saxony, 3 mi. from the Czechoslovakian frontier, at a height of 1,400 ft. above sea. Pop. (1933) 7,886. Musical instruments, objects in mother of pearl, textiles and carpets are made.

ADOUR, a river of south-west France, rising in the department of Hautes Pyrénées, south of the Pic du Midi de Bigorre, and flowing in a wide curve to the Bay of Biscay. It traverses the beautiful valley of Campan and, after passing Bagnères de Bigorre, enters the plain of Tarbes Beyond Tarbes numerous canals are drawn from the river for irrigation purposes; the most important is the Canal d'Alaric, which follows the right bank for 36 mi. Within the department of Landes it flows west and later south-west, becoming navigable at St. Sever, beyond which it is joined on the left by the Larcis, Gabas, Louts and Luy, and on the right by the Midouze. After Bayonne the river enters the sea through a dangerous estuary, after a total course of 208 mi The mouth of the Adour has repeatedly shifted, its old bed being represented by the series of *étangs* and lagoons extending northward as far as the village of Vieux Boucau (22½ mi.), where it debouched in the 14th century. The present channel was constructed by the engineer Louis de Foix in 1579. The area of the basin of the Adour is 6,565 sq.mi.

**ADRA** (anc. *Abdera*), a seaport of S. Spain, in Almería province. Pop. (1940) 6,907 (mun., 12,443). Adra is the port of shipment for the lead obtained in the Sierra de Gádor near Berja, 10 mi. N E., and also exports grapes, sugar and esparto grass.

**ADRAR** (Berber for "uplands"), the name of various districts of the Sahara, northern Africa. Adrar Sutuf is a hilly region in southern Rio de Oro (*q.v.*). Adrar el Jebli, otherwise Adghagh, a plateau north-east of Timbuktu, is the headquarters of the Awellimiden Tuareg (see TUAREG and SAHARA). Adrar n'Ahnet and Adrar Adhafar are smaller regions in the Ahnet country south of Insalah. Adrar Temur, the best known region of the name, is in the western Sahara, 300 mi. N. by E. of the Senegal and separated on the north-west from Adrar Sutuf by wide valleys and sand dunes. Adrar is within the French sphere of influence. In general barren, the country, which occupies the centre of a plateau scarped steeply westwards, contains several oases, with a total population of about 10,000. The chief centres of population are Atar, Shingeti, Wadan and Ujeft, Shingeti being the chief commercial centre, whence caravans take to St. Louis gold-dust, ostrich feathers and dates. A considerable trade is also done in salt from the sebkha of Ijil, in the north-west.

Adrar or Adgar is also the name sometimes given to the chief settlement in the oasis of Tuat in the Algerian Sahara.

**ADRASTUS:** *see* OEDIPUS.

**ADRENAL GLANDS.** These consist of two parts. The inner portion, the medulla, produces epinephrine—also known as adrenaline. The outer portion, the cortex, elaborates cortisone, hydrocortisone and at least one other hormone which is probably a steroid, and is concerned with mineral metabolism. About 25 other steroids are present in the adrenal cortex but they have little or no physiologic activity and are apparently intermediate steps in the elaboration of cortisone and hydrocortisone.

Epinephrine when administered mimics the action produced by stimulation of the sympathetic nervous system and fortifies the body in an emergency—Cannon's theory. Among these effects are a rapid rise in blood pressure, an increase in the concentration of blood sugar and the flow of blood to the muscles, and inhibition of digestion. However, the adrenal medulla is not essential for life. Activity of the medulla is controlled largely by stimulation of sympathetic nerves and by humoral agents such as acetylcholine and insulin.

The physiologic activity of the cortical hormones can be summarized under three aspects. First, mineral metabolism: the maintenance within narrow limits of the concentration in the blood of sodium potassium and chloride is essential for life. The secretions of the adrenal cortex exert an important influence on this phenomenon. The hormone (or hormones) which produces this effect had not been isolated at mid-20th century. Second, organic metabolism: the utilization and distribution of carbohydrates, proteins and fats are modified by cortisone and hydrocortisone. Third, tissue reactions such as hypersensitivity, allergic states and collagen diseases: the beneficial results produced by cortisone and hydrocortisone are manifested in the relief of rheumatoid arthritis and about 20 other diseases. The adrenal cortex does not appear to be directly involved in the aetiology of any of these diseases, and the manner in which cortisone and hydrocortisone produce their effect is not known. The activity of the adrenal cortex is controlled by the pituitary gland through an agent designated as adrenocorticotropic hormone or ACTH

(E. C KL)

ADRENALIN (EPINEPHRINE) is one of the active principles of the medulla of the suprarenal gland It produces effects similar to those resulting from stimulation of the sympathetic nervous system and is thought to be similar to, if not identical with, the substance sympathin liberated at the terminations of the sympathetic nerves. It is used in circulatory emergencies and in treatment of asthmatic paroxysms and anaphylactoid reactions. Added to local anaesthetic solutions, it increases the duration of anaesthesia and decreases systemic toxicity by reducing absorption through local vasoconstriction (*See* ADRENAL GLANDS).

(F. L. A.)

**ADRIA** (anc. *Atria*), the form Adria or Hadria is less correct. Atria was a town in Picenum, the modern Atri, town and episcopal see, province of Rovigo, Italy, 15 mi E by rail from the town of Rovigo. It is situated between the mouths of the Adige and the Po, about 13½ mi from the sea and but 13 ft. above it. Pop. (1936), 9,435 (town), 32,762 (commune). It gave its name to the Adriatic and was an important Etruscan harbour. The town was famous in Aristotle's day for a special breed of fowls. Even then river silt rendered access difficult, and the historian Philistus excavated a canal to the sea. This was still open in the imperial period, and the town possessed its own guild of sailors; but its importance gradually decreased. The remains of the ancient town lie 10–20 ft. below the modern level.

**ADRIAN** or **HADRIAN** (Lat. *Hadrianus*), the name of six popes.

ADRIAN I., pope from 772 to 795, was the son of Theodore, a Roman nobleman. Soon after his accession Adrian found it necessary to invoke the aid of Charlemagne against Desiderius, king of the Lombards. In his contest with the Greek empire and the Lombard princes of Benevento, Adrian remained faithful to the Frankish alliance, and the friendly relations between pope and emperor were not disturbed by the difference which arose between them on the question of veneration of images, to which Charlemagne and the Gallican Church were strongly opposed, while Adrian approved the decree of the council of Nicaea (787), confirming the practice and excommunicating the iconoclasts. The dispute remained unsettled at Adrian's death. Adrian restored the ancient aqueducts of Rome, and governed his little state with a firm and skilful hand.

ADRIAN II., pope from 867 to 872, was a member of a noble Roman family, and became pope in 867, at an advanced age. Like his predecessor, Nicholas, Adrian II. was forced to submit, at least in temporal affairs, to the tutelage of the emperor, Louis II., who placed him under the surveillance of Arsenius, bishop of Orta, his confidential adviser, and Arsenius's son Anastasius, the librarian. Adrian had married in his youth, and his wife and daughter were still living. They were carried off and assassinated by Anastasius's brother, Eleutherius. Adrian died in 872.

ADRIAN III., pope, was born at Rome He succeeded Martin II. in 884, and died in 885, on a journey to Worms.

ADRIAN IV. (Nicholas Breakspear), pope from 1154 to 1159, the only Englishman who has occupied the papal chair, was born before A.D. 1100 at Langley, near St. Albans, in Hertfordshire. Nicholas went to Paris and became a monk of the cloister of St. Rufus, near Arles. He rose to be prior, and in 1137 was unanimously elected abbot. Eugenius III. created him cardinal bishop of Albano. From 1152 to 1154 Nicholas was in Scandinavia as legate, organizing the affairs of the new Norwegian archbishopric of Trondhjem, and arranging for the recognition of Uppsala as a metropolitan see in 1164. Nicholas was elected pope on Dec. 4, 1154. He at once endeavoured to compass the overthrow of Arnold of Brescia, the leader of anti-papal sentiment in Rome,

Disorders ending with the murder of a cardinal led Adrian, shortly before Palm Sunday 1155, to put Rome under the interdict. The senate thereupon exiled Arnold, and the pope, with the co-operation of Frederick I. Barbarossa, was instrumental in procuring his execution. Adrian crowned the emperor at St. Peter's on June 18, 1155, a ceremony which so incensed the Romans that the pope had to leave the city for some months. At the diet of Besançon in Oct. 1157, the legates presented to Barbarossa a letter from Adrian which alluded to the *beneficia* conferred upon the emperor, and the German chancellor translated this *beneficia* in the feudal sense. In the storm which ensued the legates were glad to escape with their lives, and the incident at length closed with a letter from the pope, declaring that by *beneficium* he meant merely *bonum factum.* The breach subsequently widened, and Adrian was about to excommunicate the emperor when he died at Anagnia on Sept. 1, 1159

In 1155 Henry II. of England sent an embassy to Adrian to ask for permission to invade and subjugate Ireland, in order to gain absolute ownership of that isle. Unwilling to grant a request counter to the papal claim (based on the forged Donation of Constantine) to dominion over the islands of the sea, Adrian proposed that the king should become hereditary feudal possessor of Ireland while recognizing the pope as overlord. This compromise did not satisfy Henry, so the matter dropped; Henry's subsequent title to Ireland rested on conquest, not on papal concession, and was therefore absolute. The much-discussed bull *Laudabiliter* is, however, not genuine.

*See* Herzog-Hauck, *Realencyklopädie,* 3rd ed (excellent bibliography), and Wetzer and Welte, *Kirchenlexikon,* 2nd ed. under "Hadrian IV"; also Oliver J. Thatcher, *Studies concerning Adrian IV* (Chicago, 1903); R. Raby, *Pope Adrian IV; An Historical Sketch* (London, 1849); and A. H. Tarleton, *Life of Nicholas Breakspear* (London, 1896).

ADRIAN V. (Ottobuono de' Fieschi), pope in 1276, was a Genoese who was created cardinal deacon by his uncle Innocent IV. In 1264 he was sent to England to mediate between Henry III. and his barons. He was elected pope to succeed Innocent V. on July 11, 1276, but died at Viterbo on Aug. 18, without having been ordained even to the priesthood.

ADRIAN VI. (Adrian Dedel, not Boyens, probably not Rodenburgh, 1459–1523), pope from 1522 to 1523, was born at Utrecht in March 1459, and became tutor to the seven-year-old Charles V. Charles secured his succession to the see of Tortosa, and on Nov. 14, 1516, commissioned him inquisitor-general of Aragon. During the minority of Charles, Adrian was associated with Cardinal Ximenes in governing Spain. After the death of the latter Adrian was appointed, on March 14, 1518, general of the reunited inquisitions of Castile and Aragon, in which capacity he acted until his departure from Tarragona for Rome on Aug. 4, 1522. When Charles left for the Netherlands in 1520 he made Adrian regent of Spain. In 1517 Leo X. had created him cardinal priest *SS. Ioannis et Pauli;* on Jan. 9, 1522, he was almost unanimously elected pope. Crowned in St. Peter's on Aug. 31, at the age of 63, he entered upon the lonely path of the reformer. His programme was to attack notorious abuses one by one; but in his attempt to improve the system of granting indulgences he was hampered by his cardinals; reduction of the number of matrimonial dispensations was impossible, for the income had been farmed out for years in advance by Leo X. In dealing with the early stages of the Protestant revolt in Germany Adrian did not fully recognize the gravity of the situation. At the diet which opened in Dec. 1522 at Nuremberg he was represented by Chieregati, whose instructions contain the frank admission that the whole disorder of the church had perchance proceeded from the Curia itself, and that there the reform should begin. But Adrian was stoutly opposed to doctrinal changes, and demanded the punishment of Luther for heresy. The statement in one of his works that the pope could err in matters of faith (*"haeresim per suam determinationem aut Decretalem asserendo"*) has attracted attention; but as it is a private opinion, not an *ex cathedra* pronouncement, it is held not to prejudice the dogma of papal infallibility. On Sept. 14, 1523, he died, after a pontificate too short to be effective.

BIBLIOGRAPHY.—Most of Adrian VI.'s official papers disappeared soon after his death He published *Quaestiones in quartum sententiarum praesertim circa sacramenta* (Paris, 1512, 1516, 1518, 1537; Rome, 1522), [illegible] *quodlibeticae XII.* (1st ed Louvain, 1515). *See* L. Paris 1886–92).

**ADRIAN, SAINT,** one of the praetorian guards of the Emperor Galerius Maximian, who, becoming a convert to Christianity, was martyred at Nicomedia on March 4, 303. His limbs were struck off on an anvil, and he was then beheaded. St. Adrian's festival, with that of his wife, St. Natalia, is kept on Sept. 8. He is specially a patron of soldiers, and is much reverenced in Flanders, Germany and the north of France.

**ADRIAN,** a city in southeastern Michigan, U.S., about 32 mi. N.W. of Toledo, on federal highway 223. It is the county seat of Lenawee county, and is served by the New York Central, the Wabash and the Detroit, Toledo and Ironton railways. The population was 18,402 in 1950, 14,230 in 1940 and 13,064 in 1930 (federal census).

The county, a rich farming land, contains beautiful lakes. Adrian's trade in grain, livestock and dairy products is extensive.

Main manufactures include automobile parts, aluminum and brass products, aircraft parts, chrome plating, drills, laboratory and hospital furniture, wood products, machine tools, coil springs, concrete block machinery and milk products.

Educational institutions include Adrian college, a Methodist school established in 1859, and Siena Heights college, a Catholic institution for girls. The State Girls Training school is located in the city.

Adrian was laid out in 1828; incorporated as a village in 1836; became the county seat in 1838; and was chartered as a city in 1853. Tradition says that it was named after the emperor Hadrian.

**ADRIANI, GIOVANNI BATTISTA** (1513–1579), Italian historian, was born of a patrician family of Florence. At the instance of Cosimo I he wrote *Istoria de' suoi tempi* (1583; modern ed. 1872), covering the years 1536 to 1574.

*See* G. M. Mazzucchelli, *Gli Scrittori d'Italia,* i, p. 151 (1753); G. Mondaini, *La storia dei suoi tempi di G. B. Adriani* (Tôrino, 1905).

**ADRIANOPLE** or EDIRNE, the capital of the vilayet of Adrianople, Turkey, 137 mi. by rail W.N.W. of Constantinople. It occupies both banks of the river Tunja, at its confluence with the Maritsa, which is navigable to this point in spring and winter. The nearest seaport by rail is Dédéagatch, west of the Maritsa; Enos, at the river-mouth, is the nearest by water. Adrianople is on the railway from Belgrade and Sofia to Constantinople and Salonica. In appearance it is thoroughly oriental—a mass of mean, irregular wooden buildings, threaded by narrow tortuous streets, with a few better buildings. Earlier buildings include Eski Serai, a half-ruined palace of the sultans; the bazaar of Ali Pasha; and the fine 16th century mosque of the sultan Selim II., built by Sinan.

The war of 1877–78 impoverished Adrianople, and the creation of a customs cordon between it and Eastern Rumelia (1885) put an end to its commercial headship of Thrace, and parts of Bulgaria and Philippopolis and Burgas took most of its trade. The city manufactures silk, leather, tapestry, woollens, linen, and cotton, and has an active general trade. Besides fruits and agricultural produce, its exports include raw silk, cotton, opium, rose-water, attar of roses, wax, and the dye known as turkey red. The surrounding country is extremely fertile, and its wines are the best produced in Turkey. The city is supplied with fresh water by means of an aqueduct carried by arches over an extensive valley. There is also a fine stone bridge over the Tunja.

Adrianople was originally known as Uskadama or Uskodama, but was renamed and enlarged by the Roman emperor Hadrian

(117–138). In 378 the Romans were here defeated by the Goths. Adrianople was the residence of the Turkish sultans from 1361, when it was captured by Murad I., until 1453, when Constantinople fell. It was occupied by the Russians in 1829 and 1878 (*see* RUSSO-TURKISH WARS).

During the first Balkan War Adrianople was taken from the Turks by Bulgars, with Serbian assistance, in 1913, after a siege of 155 days. During the second Balkan War, in June, 1913, the Turks retook the town and, by the Treaty of Constantinople, signed on Sept. 29, 1913, it was ceded, together with Karagatch, to Turkey by Bulgaria. After World War I, the Greek army commissioned to restore order in Thrace (May 1920), entered Adrianople in July, and it was ceded to them (Aug. 10, 1920) by the Treaty of Sèvres. During the Graeco-Turkish War of 1923 the Greeks occupied Karagatch, the railway station of which is very important for the traffic of Dédéagatch and had therefore been abandoned by Turkey to Bulgaria in 1915. On leaving it they destroyed many buildings and removed the machinery from the mills. After the close of World War I Adrianople was again restored to Turkey by the Mudania Convention of October 1922, confirmed by the Treaty of Lausanne of July 24, 1923. A protocol subjected the Greek inhabitants of Karagatch to the exchange of populations, compelling them to emigrate six months after the re-establishment of peace.

The population in 1940 was given as only 45,680, as compared with about 80,000 in 1905 and 65,454 in 1911. This diminution was due to the emigration of the population, with the exception of the Jews, after the successive occupations of the city. The south-western portion of the city, burnt down in 1905, was rebuilt with comparatively broad streets The railway station, which stands among ruins, has been rebuilt.

See *British and Foreign State Papers*, 1914, part 1. vol. cvii, p. 706 (1920); vol. cxiii., p. 652 (1917–23); *Treaty Series*, No. 16 (1923).

**Adrianople, Battle of, 378.**—This is one of the milestones of military, and, in less degree, of political history, for the Roman Empire's barriers against the barbarians were breached so gravely that temporary repair was effected only by the substitution of the forces of destruction—the Goths and Teutons—for the regular imperial forces, and it also marks the changing relative values of infantry and cavalry.

The Visigoths were allowed in 376 to move inside the Roman border to escape the pressure of the Huns. A year later they revolted, and in 378 the Emperor Valens (*q.v.*) determined to subdue them. When (Aug. 9) the attack was made the main body of the Gothic cavalry was away foraging; Gothic offers of surrender, made to regain time for their recall, failed; the Romans, with the legions in the centre, and the cavalry on the wings as customarily, assaulted the Goths' position around the great wagon-laager, when suddenly the enemy squadrons appeared on the scene and charged "like a thunder-bolt" against their left flank. The Roman cavalry were swept aside, while the Gothic horse drove the left wing infantry in upon the centre and reserve, the pressure forcing the Romans into a disordered mass which was too dense to allow them to use their weapons. Surrounded on all sides and forsaken by their right wing cavalry and foot, the Roman main body was massacred, and only after two-thirds of the army had fallen could the survivors break through and follow the retreat of the right wing.

That evening the sun set for all time on the glory of the legions, the infantry who had been the foundation of Roman world-power, and a thousand years' era of cavalry supremacy was ushered in. Henceforth cavalry became the predominant arm of the Roman army, as reorganized by Theodosius, and 150 years later, during Justinian's revival of Roman power, we find Belisarius risking battle and achieving victory without waiting for his infantry to arrive on the battlefield. (*See* ROMAN ARMY.)

**ADRIATIC SEA** (ancient *Adria* or *Hadria*), an arm of the Mediterranean sea separating Italy from the Balkan peninsula, occupying a structural depression between the New Fold mountain systems of the Apennines and the Dinaric Alps. The sea extends from north-west to south-east between lat. 40° and 45° 45′ N., a length of nearly 500 miles. Its average width is *c.* 110m.; but the Strait of Otranto is only 45 miles. The Italian shore, except where the Apennines fall steeply to a narrow coastal ledge between Rimini and Mt Gargano, is low, merging in the north-west into the marshes and lagoons about the delta of the Po, the basin of which is structurally a continuation of the Adriatic. The sediment brought by the river has pushed forward the coast-line for several miles within historic times. The east coast is generally rugged, and south of the Istrian peninsula, placed between the Gulf of Trieste and the Strait of Quarnero, is fringed with islands (*e.g.*, Veglia, Cherso, Brazza and Curzola) and with many small islets and rocks which represent submerged parallel deviations of the longitudinal mountain folds. Opposite the islands of the Dalmatian coast the sea is shallow, and in the extreme north rarely exceeds 25 fathoms. But between Sebenico and the Abruzzi a well marked depression occurs, with depths exceeding 100 fathoms. South of this shallower water continues, but beyond Mt Gargano and south of Ragusa depths of over 500 fathoms are reached, and a small area of this basin falls below 800 fathoms. Opposite this deeper water, at the 100 fathom line, the islands of the Balkan coast disappear. The absence of good harbours on the Italian side contrasts with the excellent inlets of the Dalmatian coast. Here the rocks are mainly cretaceous and have characteristic features of dry barren soil and poor vegetation despite the fairly heavy rainfall. Some of the islands, however, are luxuriant with dark vegetation. The *bora* (north-east wind), and the prevalence of sudden squalls, are dangers to navigation in winter. Tidal movement is slight. (*See* also MEDITERRANEAN SEA.)

For the "Marriage of the Adriatic," or more properly "of the sea," a ceremony formerly performed by the doge of Venice, *see* the article BUCENTAUR. (X.)

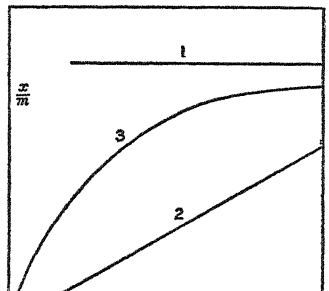
**Political Question.**—Before the World War the Adriatic littoral belonged to four States, Italy, Austria-Hungary, Montenegro and Albania, and in practice to the two first. In negotiating the "secret" Treaty of London of April 26, 1915, the Italian Government aimed at securing, in return for Italy's entrance into the war on the side of the Allies, the conversion of the Adriatic into an Italian lake—*il nostro mare*.

Article 4 of that treaty provided that "all Istria up to the Quarnero and comprising Volosca, just beyond Abbazia and the Istrian islands of Cherso, Lussin . . . and the adjoining islets" with Castua and Mattuglie, the station for Abbazia, should become Italian Article 5 declared that Italy "shall equally receive the province of Dalmatia . . . comprising Lisarica and Tribanj in the north" to a line as far south as Cape Planca (Ploče), between Sebenico and Traù (Trogir), on the mainland, with "all the islands . . . from Premuda, Selve (Silba) and Pago in the north to Meleda in the south, comprising Lissa, Lesina, Curzola, Lagosta (Lastovo) and Pelagosa, with the solitary exception of Great Zirona (Veli Drvenik) and Small Zirona (Mali Drvenik), Bua (Ciovo), Solta and Brazza." The whole coast from Cape Planca to the "southern root" of the peninsula of Sabbioncello and from a point 10km. to the south of Ragusa Vecchia (Cavtat) to the river Viosa (north of Valona), except Montenegro, and all the non-Italian islands were to be neutralized. The rest of the Dalmatian coast, besides Fiume and the islands of Veglia and Arbe in the north, were to go to Croatia, Serbia and Montenegro, besides the Albanian roadstead of San Giovanni di Medua (the landing-place for Scutari); but Durazzo was to be Albanian.

Article 6 further conferred upon Italy "the entire sovereignity over Valona, the island of Saseno and a territory sufficiently extended to assure the defence of those points" (from the Viosa . . . approximately to the northern frontier of the district of Chimara). Article 7 neutralized the coast south of the above as far as Cape Stylos opposite Corfu. This treaty violated every principle of nationality; it assigned to Italy provinces overwhelmingly Slav (for the Italian population of Dalmatia was only 3·5%), it dismembered Albania and would have created a new Irredentism far more powerful than that which Italy had fought to cure. The entrance of the United States into the war made the treaty a dead letter, although Baron Sonnino, then Italian Minister of Foreign Affairs, still clung to it, for President Wilson refused

to be bound by it, and even some Italians, notably Bissolati and Prof. Salvemini disapproved of it.

Thus began the wearisome "Adriatic question," which at times threatened war between Italy and the Yugoslavs, and attempts were made by British publicists, notably Messrs. Steed and Seton-Watson, to bring about an agreement, the "Pact of Rome," between the two races. The departure of Sig Orlando, then the Italian premier, and Baron Sonnino from the Paris Conference was due to this question, which was not regulated till the Treaty of Rapallo between the Italians and the Yugoslavs on Nov. 12, 1920, largely the work of Signor Giolitti and Count Sforza, who had meanwhile become Premier and Minister of Foreign Affairs. In Dalmatia, Italy obtained only Zara—the one overwhelmingly Italian town—with an enclave which included the Albanian settlement of Borgo Erizzo—and the island of Lagosta. Italy kept the whole of Istria (despite its large Slav minority) with the islands of Cherso and Lussin and that of Pelagosa. "All the other islands which belonged to the former Austro-Hungarian Monarchy" were "recognized as forming part of the Kingdom of the Serbs, Croats and Slovenes."



By article 4, both States recognized the full liberty and independence of the State of Fiume (*q.v.*), consisting of the *corpus separatum* (the city) and a corridor south of Castua (which became Yugoslav) connecting it with Volosca and Abbazia. Sig Giolitti evacuated Albania, where Italy retains only the island of Saseno. Mussolini observed the Rapallo Treaty and subsequently settled the question of Fiume, which is now Italian.

The Adriatic is described at Belgrade, no less than in Rome, as "our sea," but the keys of the mouth of the Adriatic, Brindisi and Saseno, are in Italian hands.

**ADSCRIPT.** A *villein* was called an "adscript of the soil" (*adscriptus glebae*) since he could be sold or transferred with it, as in feudal days, and as in Russia until 1861. *See* VILLEINAGE.

**ADSORPTION.** If a gas or solution is brought into contact with a very finely divided or porous material (*e.g.*, charcoal, kaolin) the pressure of the gas or the concentration of the solution generally decreases, the gas or solute being concentrated on the surface of the solid. This phenomenon is known as adsorption, and the finely divided or porous solid is called the adsorbent The gas or solid can be easily removed from the surface of the solid by exhaustion, heating or washing. The efficiency of an adsorbent depends largely on its specific surface (*i.e.*, area of surface per unit mass), but as we shall see later it also depends on other factors.

CURVES OF THREE POSSIBLE TYPES OF RELATION BETWEEN THE PROPORTION OF GAS ADSORBED ON THE SURFACE AND THE PRESSURE OF THE GAS

This phenomenon of *ad*sorption is to be distinguished from *ab*sorption by the fact that the adsorbed gas or solute is concentrated on the surface of the adsorbent, while in absorption the matter taken up penetrates throughout the mass of the absorbing agent. (*See* ELECTRIC LAMPS AND VALVES, MANUFACTURE OF.)

**The Adsorption of Gases.**—Wood charcoal is very porous; so that it possesses a large specific surface, and is very efficient as an adsorbent. On exposure to the air it adsorbs the atmospheric gases. In order to demonstrate its adsorbing properties it should first be heated to redness in order to remove the adsorbed gases from its surface. If then it is brought into a vessel containing a gas, an immediate diminution of pressure would be indicated by an attached manometer, reaching eventually a constant value. This final equilibrium pressure depends on the temperature, the nature of the gas and adsorbent, and also on the specific surface of the latter. Adsorption can also be shown by filling a glass tube with ammonia with the open end of the tube dipping into a trough of mercury. A piece of charcoal (after being heated to redness and allowed to cool) is introduced on to the surface of the mercury in the tube The mercury rises rapidly in the tube, indicating a rapid diminution in the volume of the gas. The ammonia can be recovered from the charcoal by heat or by exhaustion. Hydrogen burns with a pale blue flame which is non-luminous; if the hydrogen is bubbled through benzene it burns with a smoky luminous flame due to the presence of benzene vapour. If the mixture of hydrogen and benzene vapour is passed over charcoal the benzene is adsorbed, as shown by the non-luminous character of the flame of the gas which passes through.

When an adsorbent remains for some time in contact with a gas, an adsorption equilibrium is established, the amount of gas adsorbed per unit mass of the adsorbent increasing with decreasing temperature and with increasing pressure. By plotting the pressures $p$ as abscissae, and the amount of gas adsorbed per unit mass of the adsorbent as ordinates, curves similar to those shown in figure (Curve 3) are obtained. Such a curve, which represents the amount adsorbed at constant temperature, is termed an "adsorption isothermal." It is seen from the curves that the amount of gas adsorbed is not proportional to the gas pressure, but that it increases much more rapidly at low pressures than at high pressures. The adsorption isothermal can be represented by the equation:

$$x/m = ap^{1/n}$$

where $x$ is the amount of gas adsorbed by $m$ grams of the adsorbent at gas pressure $p$; $a$ and $n$ are arbitrary constants. The value of $a$ depends on the units of measurement, and $n$ is characteristic of the adsorbent and of the gas. Thus, for the adsorption of $CO_2$ $NH_3$ or $SO_2$ on charcoal, the values of $1/n$ are 0·394, 0·437 and 0·324, respectively, whereas for the same three gases on glass, the values are 0·66, 0·53, 0·28. These constants also vary with the temperature, $1/n$ approaching unity at high temperatures. The temperature at which the unity value is reached depends on the critical temperature of the gas. For hydrogen, which has a very low critical temperature, the value of $1/n$ is unity at ordinary temperatures, but it is less than unity at the temperature of liquid air. In general the value of $1/n$ becomes 1 at temperatures considerably above the critical temperature of the gas.

The logarithmic equation of the isotherm is:

$$\log x/m = \log a + 1/n \log p,$$

which is the equation of a straight line. On plotting experimental values, however, it is found that it only holds at low pressures. As the pressure increases the logarithmic curve ceases to be a straight line, and bends towards the pressure axis. The pressure at which this deflection occurs varies from gas to gas; it is lower the more readily the gas is condensed. Below the critical temperature the equation does not hold for even low pressures. The adsorbability of gases runs more or less parallel with their condensability. The above equations, which are due to Freundlich, imply that an indefinite increase in pressure produces an indefinitely large adsorption. Recent work by Langmuir and others indicates that on increasing the pressure surface saturation is reached. Arrhenius introduced this ($s$) into his equation for adsorption, viz., $k \cdot dx/dp = (s-x)/x$.

The rate of adsorption is high, equilibrium being reached in a few minutes. The kinetic equation is $dp/dt = k(p\infty - p)$, $dp/dt$ being the rate of diminution of pressure; $p\infty$ and $p$ being the pressures at equilibrium and at time $t$ respectively. Since adsorption is decreased by a rise in temperature, it follows that it is accompanied by evolution of heat. This can be readily shown by means of a thermometer immersed in the adsorbent when adsorption takes place. The heat of adsorption can be calculated from the temperature-coefficient of adsorption. If the adsorbent is in contact with several gases at the same time, the adsorption of each is diminished, and at equilibrium the amounts of the several gases adsorbed are in proportion to their respective adsorbabilities. Nothing is definitely known about the influence of the nature of

the adsorbent. Wood or animal charcoal is by far the most efficient. Silica gel is also a very powerful adsorbent. In the adsorption of *gases* on the surface of solids the adsorbed gas forms a layer one molecule thick on the adsorbent, but in the adsorption of *vapours* the layer may be several molecules thick.

**Adsorption in Solution.**—Small drops of a pure liquid, when free from external influences assume a spherical shape. This can be seen with drops of water on a waxy surface—if the drops are large then the effect of gravity is appreciable and the drops become flattened. A liquid suspended in another liquid of the same density and in which it is insoluble also assumes a spherical shape. The second law of thermodynamics states that free energy always tends to become a minimum, and in the case of liquids the free surface energy therefore tends towards a minimum. The free surface energy of a liquid is the product of its surface tension and the area of its surface, so that if there is a diminution in the surface tension or in the superficial area there is a diminution in the free surface energy. A pure liquid cannot change its surface tension, but its surface area is reduced to a minimum if it assumes a spherical shape, for it is characteristic of a sphere that for a given volume it has the minimum surface. If we consider a liquid containing a substance in solution, and having a lower surface tension than the pure liquid, *e g.*, a solution of one of the fatty acids in water, we find that the lowering of the surface tension results in a lowering of the free surface energy of the liquid; the effect is all the greater the more concentrated the solution. The free surface energy would decrease still further if there were an unequal distribution of the solute in the solution, *i.e.*, if the concentration of the surface layer of the solution were greater than the concentration of the bulk of the solution. This is found to be the case in all solutions where the solute lowers the surface tension of the solvent, and we may state generally that those solutes which decrease the surface tension of the solvent are concentrated at the surface, and, conversely, those solutes which raise the surface tension of the solvent have a lower concentration in the surface layers than in the bulk of the solution. This generalization is known as Gibbs's adsorption theorem. The increase in concentration of the solute at the surface is a case of adsorption of the solute at this surface. Solutions of low surface tension are apt to foam or froth. Conditions favourable to frothing are low surface tension, low volatility and not too high mobility of the liquid. Pure liquids do not froth. A solution of soap in water froths very readily; if this froth is collected it is found to contain a much greater concentration of soap than the bulk of the liquid, *i.e.*, the soap has been adsorbed on the air-liquid surface.

**Adsorption of Solutes by Solids.**—The adsorption of solvents by solids is explained in exactly the same way as that of solutes at the gas-liquid interface. It is the application of Gibbs's adsorption theorem to the distribution of the solute. Those solutes which lower the surface tension at the liquid-solid interface will be concentrated or adsorbed at that surface and vice versa. When the surface area of the solid is very large (porous or very finely divided solids), the free surface energy assumes very high values, and may be considerably reduced as a result of adsorption. In the case of the gas liquid interface, the surface tension, and consequently the free surface energy, can be readily determined, and thus the results of adsorption interpreted quantitatively. It does not follow that a decrease in the surface tension at the gas-liquid interface involves a decrease in the surface tension at the liquid-solid interface. The measurement of the surface tension in the latter case is extremely difficult, and the results are not trustworthy. If charcoal is shaken with a solution of methylene blue in water, a decrease in the concentration of the solution is indicated by a decrease in the intensity of its colour. A similar result is obtained by shaking charcoal with a solution of the fatty acids, amines, phenols, etc., in water; the solutes are adsorbed by the charcoal, since they lower the surface tension and therefore the free surface energy at the solution-charcoal interface.

In the case of solutes which raise the surface tension of the solvent, the converse holds, *i.e.*, the concentration of the surface layers will be less than that of the bulk of the solution, and the concentration of the solvent is relatively greater at the solid–liquid surface. We thus have two cases of adsorption; the first, resulting in a diminution in the concentration of the solution, is generally known as positive adsorption, and the second, resulting in an increase in the concentration of the solution, is known as negative adsorption.

It has been suggested that liquids in contact with charcoal are actually compressed on the surface of the solid, and this pressure has been estimated at 10,000 to 60,000 atmospheres. Positive adsorption is utilized largely in industry. Bancroft has determined the efficiencies of the more important decolorizing agents

| *Material* | *Efficiency* | *Material* | *Efficiency* |
|---|---|---|---|
| Alumina | 100 | Bone charcoal | 17 |
| Fuller's earth | 50 | Ferric oxide | 3 |
| Bauxite | 40 | Kieselguhr | 3 |

The amount of adsorption generally decreases with increasing temperature, but the rate of adsorption increases with increasing temperature. In adsorption efficiency, specific surface plays a very important part—the higher the specific surface the more efficient the adsorbent. Freundlich's isotherm for adsorption from solution is:

$$x/m = Kc^{1/n};$$

$x/m$ is the amount of solute adsorbed per unit mass of adsorbent; $c$ is the concentration of the solution at equilibrium; $K$ and $n$ are constants, the values of which vary considerably (*e.g.*, $n$ varies between 1 and 5), and depend on the temperature, nature and specific surface of the adsorbent, and also on the solvent.

The adsorption isothermal defines the relationship between concentration in the solution and the quantity adsorbed, as with gases; at small concentrations relatively more is adsorbed than at higher concentrations. This relationship only holds for dilute solutions: at high concentrations a saturation value is reached—in fact, at very high concentrations the amount adsorbed seems to decrease, due to more of the solvent being adsorbed. The adsorption of a salt is an additive property of the cation and the anion; thus, the adsorbability of a series of potassium salts is in the same order as that of sodium salts. The order of adsorbability of cations is as follows: Organic dyes (basic), $H^+$, $Ag^+$, $Hg^+$, $Cu^{++}$, $Al^{+++}$, $Zn^{++}$, $Mg^{++}$, $Ca^{++}$, $NH^+_4$, $K^+$, $Na^+$; and for the anions: Organic dyes (acidic), $OH^-$, $CN^-$, $S^{--}$, $I^-$, $NO^-_3$, $Br^-$, $Cl^-$, $SO^{--}_4$. Apart from the organic dyes, hydrogen and hydroxyl ions are the most readily adsorbed. In the case of the metals, the valency and the position of the element in the electrolytic potential series seem to be of importance. This preferential adsorption of $H^+$ and $OH$ gives the adsorbent a positive or negative charge, and explains the origin of the electric charge on colloidal particles. The coagulation of colloidal solutions by electrolytes is also explained by the preferential adsorption on the surface of the colloidal particles of one ion which neutralizes its charge (*see* Colloids).

If we consider the adsorption of methylene blue by kaolin, we find that the adsorbent is very efficient, much more efficient than in the adsorption of the fatty acids, etc. The solute in the case of methylene blue is highly ionized, and it comes into contact with a solid (calcium silicate) whose anion is extremely insoluble, but whose cation readily goes into solution. The calcium ions of the solid therefore change places with the methylene blue cation in solution. This kind of adsorption is known as exchange adsorption and is polar in character.

**Theories of Adsorption.**—Three theories of adsorption have been advanced: (1) Chemical theory; (2) Solution theory; (3) Surface theory.

**Chemical Theory.**—If one regards adsorption equilibria as chemical equilibria, then the adsorption isotherm must be a special case of the law of mass action (*see* Chemical Action). If one considers the adsorbent and the compound of the adsorbent and adsorbed substance as solid phases of constant composition one must also assume a phase of variable composition (a solid solution) in order to apply the adsorption isotherm. Then the adsorption equilibrium can be regarded as a chemical equilibrium. The opponents of this theory claim that chemical equilibrium is very

specific, the equilibrium and velocity coefficients vary considerably with the nature of the reacting molecules (in the adsorption isotherm this is $1/n$). Adsorption equilibrium, on the other hand, is but slightly specific; the constant $K$ (the equilibrium constant in the law of mass action) does not vary much under very different conditions; the same applies to $1/n$. The chemical theory makes it difficult to understand the relation between the adsorbability of a gas and its condensability, or the influence of a solute on the surface tension of a solvent and the readiness with which it is adsorbed. Again, the chemically inactive gases helium and argon are adsorbed.

**Solution Theory.**—Adsorption as a solution phenomenon has but few adherents. In adsorption, equilibrium is rapidly established, but diffusion in a solid is extremely slow. Again to bring the phenomenon of adsorption into line with Henry's law, one must assume the dissociation of the gas, which is highly improbable in most cases Some suggest that the gas is liquefied on the surface of the solid; this explains the relationship between adsorption and condensability of gases, but does not assist in the case of adsorption from solution.

**Surface Theory.**—Many regard adsorption merely as a concentration on the surface of the adsorbent in accordance with the second law of thermodynamics. Assuming the validity of the gas laws and van't Hoff's law for dilute solutions, the following equation can be deduced thermodynamically:

$$u = -c/RT\, d\sigma/dc$$

where $u$=excess of gas or solute in the surface layer; $c$=concentration of solution (pressure of gas); $R$=gas constant; and $T$=absolute temperature.

It is difficult to test this equation in the case of solid surfaces because of the difficulty of determining the value of the surface tension $\sigma$. In the case of gas–liquid and liquid–liquid surfaces, the experimental results agree qualitatively, but quantitative results are difficult to obtain on account of the necessity of using very large surfaces

The laws of chemical combination, solution and adsorption are represented by the curves in figure.

Curve 1: $x=K$ (law of constant composition). Action is due to the attractive forces between the atoms or molecules.

Curve 2: $x/p=K$ (Henry's law of solubility).

Curve 3: $x/p=K^{1/n}$. $K$ is given an exponent between 0 and 1, the values found in the case of chemical combination and solubility respectively. This phenomenon is due to molecular attraction and also to the kinetic motion of the molecules.

Modern research tends to bring together the extreme views (chemical and physical) of adsorption. At one time the phenomenon was regarded as purely physical and non-specific; adsorption is now shown to depend on a variety of factors, many of which are extremely specific and closely related to chemical phenomena. I. Langmuir and N. K. Adam studied the behaviour of oils spread in unimolecular layers on water, and found that the forces operating were not readily distinguishable from chemical forces or affinity.

**Applications of Adsorption.**—Cocoa-nut charcoal is generally employed at very low temperatures (temperature of liquid air). Adsorption facilitates the separation of the difficultly adsorbed gases hydrogen and helium from the more easily adsorbed, such as nitrogen and oxygen. The effectiveness of gas masks depends on the efficiency of the charcoal which they contain for adsorbing such poisonous gases as chlorine, phosgene, etc. A very active and porous grade of charcoal is also used in an important process for the adsorption of gasolene from natural gas.

Adsorption is of very great importance in chemical reactions, for many of them are accelerated on various solid surfaces, and this has found extensive application in industry. Mention need only be made of the contact process for the manufacture of sulphuric acid (*q.v.*), the synthesis of ammonia (*q.v.*), hydrogenation (*q.v.*) of oils, etc. Catalytic poisoning is also due to adsorption. (*See* CATALYSIS.) In dyeing, adsorption plays a very prominent part in the fixing of the dye on the material, although the formation of compounds may also play a part in some cases. In the photographic plate the silver bromide is in the colloidal form and adsorbs the sensitiser. In brewing, the gas content and taste of the beer depend largely on adsorption of the colloidal particles The growth of crystals from solution or from a molten mass is frequently influenced by the presence of other substances in solution: this rate of growth of the crystals in different directions determines their shape.

Adsorption plays a very important part in the agglutination of bacteria, and in the neutralization of a toxin by an anti-toxin In the field of public health we find adsorption of importance Aluminium hydroxide and ferric hydroxide, which are present in the soil, are very pronounced adsorbents, and filtration through soil is therefore a very efficient means of freeing sewage and other waste water from colloidal organic particles This is also of importance to agriculture as the means whereby the soil is able to retain solvents from solutions which percolate through it

**ADULIS** (mod. *Zula*) —An ancient city of Eritrea. According to Pliny, it was founded by slaves who had fled from their Egyptian masters. Excavations have led to the discovery of a considerable amount of prehistoric pottery, and of various buildings, including an altar of the Sun and two Christian churches The principal periods of its prosperity were the Ptolemaic, Graeco-Roman and Christian The city, as far as can be ascertained, had neither fortifications nor walls.

*See* R. Paribeni in *Monumenti dei Lincei,* xviii. (1907) 437 *sqq.*

**ADULLAM,** a Canaanite city (Gen. xxxviii. 2), fortified by Rehoboam (2 Chron. xi. 7), and still a place of importance at the time of the Maccabees (2 Mac. xii. 38). Its chief interest lies in its connection with David who took refuge in its stronghold ("Cave" is a scribal error) on two occasions (1 Sam. xxii. 1; 2 Sam. v. 17). A site on the eastern edge of the Shephelah in the neighbourhood of Socoh (Shuweikah) seems to be indicated. Conjectural identifications are (1) Khareitun, south-east of Bethlehem, which has a large cave but nothing else to commend it. (2) Deir ed-Dibban, some 6m. east of Shuweikah, where there are caves and (3) Aid el-Ma'ˁ, south of Shuweikah and at no great distance from it The last identification is the one most favoured. The name, which appears to represent an Arabic reconstruction of Adullam, the position and the physical characteristics of the site support it. In modern political history the term "Cave of Adullam" was applied by John Bright to certain Liberals who seceded from their party to oppose the Reform Bill of 1866. But the expression had been used earlier by President Lincoln (1864). From the same usage is derived the shorter political term "Cave" for any body of men who secede from their party on some special subject.

**ADULT EDUCATION,** a phrase originally meaning education of adults who have not been properly educated as children. As the educational system improved, the need for such education diminished, but as democratic government developed, it brought with it the need, felt by everyone, for education in citizenship. Adult education in this sense has been described as "an inseparable aspect of citizenship" and the new movement, which dates from the beginning of this century, has extended to democratic countries all over the world, including such countries as Germany and the United States. Because these countries had early possessed a comprehensive system of elementary and secondary education, they have not felt the need for adult education in its original sense. (*See* Adult Education in the United States, page 185.) It is often also distinguished as non-vocational adult education from the vocational education now given to adults in technical and commercial colleges in many parts of the country.

The new movement has taken many forms and is carried on

by many different organizations which held ideals that were at the same time high and practical. Thus in England the Workers' Educational Association, founded by Albert Mansbridge in 1903, originally aimed at bringing together working-class organizations to provide for an education, designed not to take men out of their class or trade, but to equip them, whatever their occupation in life should be, for the work of citizenship. It was to be a highway and not a ladder. The education it desired to bring into being was to be broad, impartial and scholarly, was to aim at a higher university standard and was to enlist the aid of the universities and of public authorities.

The universities were asked to help in maintaining the standard of education, but the choice of subjects and of tutors was to be with the students. It was recognized that adult students bring an experience of life and an understanding of practical problems which are as important a contribution as the more theoretical knowledge of the teachers, and that adult education, therefore, requires a technique and organization in which both students and university trained teachers have their parts to play

**Tutorial Classes.**—In 1907 the University of Oxford organized the first tutorial class, the characteristic educational instrument of the new movement. These classes were small, between 20 and 30 persons, meeting once a week in the winter over a period of three years. Each class period consisted of an hour's lecture and an hour's discussion, the students undertaking from the start to attend for the full period of three years and to do written work. The classes were under the control of a joint committee consisting of equal numbers of representatives of the university and of working-class organizations The quality of work done in these classes was often of a good university standard. All the other universities of England and Wales followed the example of the University of Oxford, and in 1925 there were over 500 tutorial classes with 12,000 students, while the number of affiliated bodies was 2,500 and of independent members 23,000. The Board of Education has supported this work from the beginning and through its inspectors and the reports of its advisory adult education committee done much to further the standard of the teaching given Most local education authorities now give some support to adult education by grants either to tutorial classes or to the more elementary one-year classes and terminal courses which have greatly increased in numbers

The total amount of education of this kind given in democratic countries is very considerable and is rapidly increasing The movement is still young and its future organization is still uncertain. Its great strength in the past was that it has been run by voluntary associations and has in a real sense been a university controlled in the main by its students. It suffers, however, from the weakness of administration and the fluctuating enthusiasm characteristic of all voluntary organizations. Its success in the future will depend on how far it can be connected more closely with public educational institutions on the one hand and organized labour on the other, without losing its voluntary character. The British Institute of Adult Education attempts to survey and coordinate by the publication of its journal and other literature, and by the holding of conferences, the work of the various organizations in the country which are concerned with adult education. The World Association of Adult Education is working to spread knowledge of adult education in all parts of the world.

See *Final Report* of the Adult Education Committee (Cmd. 321, 1919) and *Journal of the British Institute.* (A. D. L.)

## UNITED STATES

In the United States the term adult education is used to denote an educational movement for men and women, young and old, who no longer are in contact with formalized education and whose primary interest lies in a vocation but who possess a secondary interest in their own educational improvement as a sustained and continuing process. It is sometimes called "continuing education." It [illegible] from any sort of schooling as a commencement [illegible] opportunity extending throughout life.

While the movement was not recognized in the United States under the name "adult education" until 1924, its roots were already deeply imbedded in American life The New England town meeting of the 17th century formed the initial adult education venture of record in the English colonies of North America It was a logical next step to the formation of the first lyceum in Massachusetts in 1826, a voluntary association of farmers and mechanics "for the purpose of self-culture, community instruction and mutual discussion of common public interests." The town lyceums made rapid growth and in 1839 more than 3,000 were in existence. They assumed an educational leadership with the years, Emerson, Thoreau, Lowell and Holmes among others lending them prestige. It was the example of the lyceum which led Bishop John H. Vincent and his colleagues in 1874 to expand a Sunday school association into a general adult education venture. The Chautauqua Institution (*see* LYCEUMS and CHAUTAUQUAS) resulted and in its train numerous imitators, later to be served by the commercial Chautauqua and lyceum circuits. The last quarter of the 19th century saw the beginnings of the university extension movement and with the 20th century impetus to popular education was given through Andrew Carnegie's large benefactions to public libraries. Meanwhile the tax-supported school system, as the compulsory school age was pushed upward, had instituted a series of vocational extensions, soon accompanied by such non-vocational enterprises for adults as the voluntary evening high school.

The increase in public estimation of these agencies gave rise to many other forms of educational activity for adults. Most of them were based on the American tradition of education at cost, less than cost or no cost to the student. In addition there were devised, to meet the recognized educational needs of large numbers of people, certain commercial organizations known as private correspondence schools (*see* CORRESPONDENCE SCHOOLS) operated for profit under modern salesmanship methods. Almost wholly vocational and technical in nature, these courses attracted such numbers that in 1927 the current enrolment was estimated at more than 2,000,000 persons who were annually expending $70,000,000 for the instruction offered

An inquiry into adult education needs and possibilities in England and Scotland, made as a part of the British ministry of reconstruction report of 1919, had resulted in the phenomenal growth of adult classes in those countries. Increasing recognition of the British movement and observance of a considerable American interest in various forms of continuing education led to an inquiry into American conditions, instituted in 1924 by the Carnegie Corporation of New York. Five volumes constituting reports on as many broad phases of the general subject were published, a series of regional and national conferences of teachers and leaders of adults was held and, in March, 1926, there was formed the American Association for Adult Education with headquarters in New York. It serves as a national clearing house for information, sponsors and initiates researches and studies, and supervises and conducts experiments and demonstrations in co-operation with local and national agencies.

**Urban and Rural Community Organization for Adult Education.**—The initial attempt in the United States to organize an entire community's educational facilities with special reference to the adult and his needs was made in Cleveland in 1924. The Cleveland Conference for Educational Co-operation resulted and later a complementary body, the Adult Education Association of Cleveland. In 1925, Buffalo, organized similarly, conducted a self-survey under the auspices of a co-operative group known as the Buffalo Educational council. The survey has since been published and the recommendations of the council are rapidly becoming effective. The Cleveland and Buffalo examples have brought together like groups in Chicago, Detroit, St. Louis and Brooklyn. Plans for organization have been made in eight other cities. In addition, Dallas, Texas, in its Civic Federation and Institute for social education, founded in 1920, furnishes perhaps the best example in the country of a private educational venture for adults. Representatives of the various community enterprises have formed a national community conference which has affiliated

itself with the National Community Foundation. The latter organization is conducting, on an experimental basis, community organization activities and educational programmes in 60 small cities and towns of the Middle Atlantic States. It co-operates with its related organization, the Swarthmore Chautauqua. Michigan state college is experimenting with continuing education for rural areas in two Michigan counties selected for the purpose. A preliminary survey has been made and responsibility has been assumed by local groups. The California State board of education has likewise initiated a rural county demonstration. A privately supported small town circuit in western New York has been formed, initiating programmes in 16 centres.

**Tax-Supported Adult Education.**—Approximately 100,000 men and women are enrolled in public evening schools (*see* CONTINUATION SCHOOLS) annually. They are almost exclusively in urban centres of 25,000 population or more. The work offered is either the same as the day school, designed to meet the needs of those who have had to leave school for economic reasons, or technical courses for vocational preparation, or classes for immigrants desiring to learn English. The last group has diminished rapidly since the revision of the immigration laws, although evidence is at hand that the need for such instruction still is large. The continuation school (*see* CONTINUATION SCHOOLS) is newly established and is found in only half the States of the Union and there only in the larger urban communities. It requires from four to 18 hours of student school time each week. The co-operative school, originating at the University of Cincinnati is still in an experimental stage. It provides for equal division of time between class-room and work in a factory. The usual practice is to alternate weeks. Antioch college, O., is wholly given over to the industrial co-operative idea.

**Private Technical, Commercial and Correspondence Schools.**—Thousands of business schools (*see* COMMERCIAL EDUCATION), trade schools (*see* TECHNICAL EDUCATION; INDUSTRIAL SCHOOL), and technical institutes, conducted for profit and in a relatively small number of cases, philanthropically endowed, operate in cities of all sizes throughout the country. They vary widely in efficiency and in repute. The schools of this type which utilize the correspondence method of instruction have reached large proportions in the United States. Of the 1,500,000 new students enrolled each year, 95% wish to obtain vocational training and pay from $10 to $280 for each course, the average payment being about $40. Extensive advertising methods are employed, from 30% to 80% of all tuition fees received being devoted to course salesmanship. Efforts are being made by the Federal trade commission, by the Better Business bureau of the National advertising clubs and by the National Home Study council, an association of correspondence schools, to improve business ethics and to create instructional standards.

**Schools Operated by Religious Organizations.**—Each of the large associations originally organized for religious and social purposes maintains an educational activity as an auxiliary phase. The Young Men's Christian Association (*q.v.*) enrolls about 90,000 young men, mostly in evening classes which are chiefly of a vocational nature but which recently have shown a trend toward the non-vocational. The Young Womens Christian Association (*q.v.*) has an even more widespread educational programme, though of a much more informal nature than that of the Young Men's Christian Association. Its emphasis is definitely on the side of cultural studies. The Knights of Columbus (*q.v.*) and Young Men's and Young Women's Hebrew associations repeat the patterns of the other associations on a smaller scale.

**Corporation Schools.**—Education for workers is of two general types in the United States: that provided by the workers themselves and that provided by the employers. In the latter group fall some interesting experiments in education for the job-vocational education designed for immediate practical use in the industry which offers it. The larger corporations such as the Standard Oil Company, The Westinghouse Company, the telephone and allied interests, and to a lesser degree the automobile manufacturers, have educational departments which take employés from apprentice courses to the highest technical branches.

**Workers' Education.**—Although sporadic efforts had been made during the preceding quarter century, it was not until after the World War that an organized educational movement of wage-earners assumed sizable proportions in the United States. In 1921 a group of trade unionists and teachers in New York formed the Workers' Education bureau of America as a national organization to serve as a clearing house for information and to establish study classes. The bureau has since become the agency through which the American Federation of Labor carries on its entire adult education programme for its membership. It has not only increased the number of workers' classes, but has published text-books, syllabi and study outlines. Of the dozen or so labour colleges scattered through the country, the residential Brookwood Labor college at Katonah, N.Y., is the best known. It has a two-year course and also conducts special summer institutes. The International Ladies' Garment Workers' union has the most highly developed educational programme among national unions, although those of the United Mine Workers in Illinois and Pennsylvania are worthy of note. In California, the State Federation of Labor and the University of California Extension Division have embarked upon a joint programme for workers.

**Special Summer Schools.**—At Bryn Mawr college, a summer session for women workers in industry is held annually for 100 women workers, equally divided between unionized and non-unionized workers. The Bryn Mawr plan has been successfully adopted at the University of Wisconsin, Barnard college of Columbia university, New York, and at Sweetbriar college, Virginia. The National League of Girls' clubs holds an annual summer session on Long Island for mill girls, stenographers and other industrial workers, initially trained in the league's winter classes in New England and Middle Atlantic States. These summer schools are not to be confused with those conducted in great numbers by the universities and colleges throughout the country (*see* SUMMER SCHOOLS) which, while open to adults generally, are chiefly attended by teachers and college students. The California State board of education in 1927 initiated a series of special summer schools of adult education to be held annually. The first session was held at Mills college, Oakland, with an attendance of 250. The Chautauqua Institution of New York conducts a two months' summer session annually attended by about 12,000 people. This course is comparable with a university summer session. In addition winter reading courses are attended by 10,000 persons.

**University Extension and Adult Education.**—The total enrolment of university extension students in the United States, exclusive of agricultural extension (*see* UNIVERSITY EXTENSION and AGRICULTURAL EDUCATION) may conservatively be estimated at 250,000. The university extension movement (*see* UNIVERSITY EXTENSION), through lectures, visual education media, correspondence courses, exhibits, discussion groups, reading circles, etc., easily reaches five times that number. If the 5,000,000 members of farm families reached by the State agricultural colleges in co-operation with the Federal department of agriculture be added to the general extension total, it will be seen that university and college extension is the most important factor numerically in adult education in the United States.

**Libraries and Museums.**—Through the activities of the board on the library and adult education of the American Library Association, the 4,000 communities in the United States which have their own public library facilities, together with a number of State and regional organizations, have been acquainted with a new conception of the library as a dynamic agency of education. Many of the larger libraries have instituted readers' advisory services providing individual attention for every serious reader, including the preparation of special reading courses. This association has published a "Reading With a Purpose Series" consisting of more than 40 pamphlets, each of which is a short introduction to a given subject together with a list of half a dozen recommended books in the field. Hundreds of thousands of copies of these pamphlets have been sold and distributed. (*See* LIBRARIES and SCHOOL LIBRARIES.) By means of lectures, gallery talks, guidance for visitors, publications for the layman, loan collections, travelling exhibits, consultation hours for students and manufacturers, and

formal classes, a great educational work has also been done by the museums.

**Chautauquas and Lyceums.**—The modern chautauqua and lyceum serve towns of less than 2,500 population almost exclusively. With the exception of one circuit, they are conducted for profit. The competition deriving from the radio, motion pictures and cheap transportation has resulted in large financial loss to the chautauqua and lyceum operators of late years and it is questionable whether this form of combination lecture and entertainment bureau will persist in the U.S. The commercial chautauquas are not to be confused with the Chautauqua Institution of New York.

**Women's Clubs, Parent Groups and Forums.**—Three million women in the United States belong to women's clubs, in towns and cities of all sizes. Study materials are prepared by national and state offices which form the bases of educational programs throughout the year. With the public school as the basic unit, hundreds of thousands of parents, chiefly mothers, are united in parent-teacher associations, child study (*see* CHILD STUDY ASSOCIATIONS), child welfare groups, etc. They are served by several national organizations. Each group is engaged upon an educational program. Certain of the large state universities, notably Iowa, Minnesota and California, have recently assumed responsibilities in relation to the parental education program within their respective areas. Varying greatly in accordance with the communities which they serve, open forums flourish in many parts of the country. They are purely individualistic and autonomous; half of them are conducted by Protestant or Jewish churches.

**Individual Enterprises.**—Certain individual enterprises reflect the best which the nation has to offer in adult educational thought. Among these should be cited the People's Institute of New York, founded in 1897 as a forum for public discussion. Courses of instruction of a high standard and individual lectures are offered. In its school, the institute conducts experimental classes for adults in various parts of New York city. Similarly, the New School for Social Research of New York city may be considered an adult education enterprise. There are others of less note, including at least three Danish folk school experiments which have not yet demonstrated their adaptability to U.S. life.

**ADULTERATION,** the act of debasing a commercial commodity with the object of imitating or counterfeiting a pure or genuine commodity, or of substituting an inferior article for a superior one in order to gain an illegitimate profit. The term adulteration is usually applied to the debasement of foods, drugs or cosmetics; but adulteration may be said to be practised by profiteering contractors who substitute sand for cement in the concrete used for public buildings or by purveyors of woollen goods whose fabric is composed largely of cotton.

Adulteration has been practised by less responsible persons of almost every trade and profession, and its origins are lost in prehistoric times. So widespread and pernicious did this practice become that in ancient and mediaeval times laws were enacted to curb the most flagrant abuses. The common law dealing with fraud is in most cases sufficient to deal with the ordinary forms of adulteration, but all civilized nations found it necessary to enact special legislation to deal with adulteration of foods and drugs.

There are numerous references to adulteration in the classics. Elisha, the biblical prophet, was warned that the herbs of which his pottage was made were poisonous weeds by the cry, "There is death in the pot." Pliny the Elder complained of the "white earth" added to the bread baked in the days before the destruction of Pompeii.

Both Athens and Rome enacted laws to prevent the adulteration of wine with colours and flavouring agents. Because of the economic importance of spices in the middle ages, the temptation to market sophisticated products was great; and in 1316 the pepperers or spicers of London began to regulate the quality of their produce. During the reign of William the Conqueror, brewers were subject to severe fines for adulterating beer. During the reign of John (1203), the first proclamation regarding the adulteration of bread was made The first statute specifically prohibiting the adulteration of human food was enacted during the reign of Henry III. In France and Germany, food control statutes were passed in the 13th century. The artificial colouring of butter was prohibited by the *prevost* of Paris in the 14th century.

## MODERN LEGISLATION

Both Great Britain and the United States enacted laws from time to time widening the control exercised over foods and drugs. The initial laws dealt principally with adulteration and were designed to prevent specific abuses Adulteration of food received the earliest legislative attention, partly because the practice was widespread and affected the greatest number of people and partly because the honest purveyors of foodstuffs were placed at an economic disadvantage from which relief could not be obtained otherwise Increase in legislative control was brought about by technological advances in the food industry such as the development of commercial canning, production of processed foods and the gradual shift of the population from agrarian pursuits to industrial employment with the resultant growth of large cities and the attendant problems of food distribution. This change in character of food production and distribution proceeded most rapidly from about 1865 to 1920 although commercial canning actually began in Europe in 1810, and in 1940 frozen foods were just beginning to become popular in the United States.

**British Legislation.**—One of the earliest acts of the English parliament dealing with food adulteration was directed at the sophistication of tea. The acts of 1725 and 1730 prescribed penalties for adulteration of this commodity. Similar acts were passed dealing with coffee in 1718 and with cocoa in 1803. The addition of extraneous colouring matters to beer and porter was prohibited in 1816. These laws were penal in nature and served the double purpose of ensuring the integrity of the articles subject to them and of furnishing inland revenue. The enforcement was left in the hands of revenue officers.

Dr. Arthur H. Hassall was one of the first to utilize the microscope to detect adulteration. In 1850 he demonstrated that adulteration of coffee with chicory could be determined by this method, and he was commissioned by Thomas Wakley (1795–1862), owner of the *Lancet,* to extend his examination to other articles of food. Hassall's findings were published as reports of the Lancet Analytical Sanitary commission. Adulteration was found to be rampant, and scarcely any common foodstuff was found which was not adulterated. These disclosures and the pressure of public opinion resulted in the appointment of a parliamentary committee in 1855, and in 1860 the first act that dealt directly with the adulteration of food, known as the Adulteration of Food and Drink act, was passed. This act did not provide a clear-cut procedure for its enforcement nor did it provide for a responsible enforcing body. As a result this act, though praiseworthy in intent, was wholly ineffective. The Adulteration of Food and Drugs act (1872) provided for the purchase of samples by inspectors and the analysis of such samples by analysts. Penalties were prescribed: a fine of £50 for the sale of an injurious food and six months' imprisonment at hard labour for a second offense. This act defined an adulterated article as "any article of food or drink or any drug mixed with any other substances, with intent fraudulently to increase its weight or bulk, without declaration of such admixture to any purchaser thereof before delivering the same." In essence this definition is that followed in subsequent acts. Little attention was paid to this act outside of London and a few small towns, but cases which did arise under the act soon revealed weaknesses and defects which occasioned complaints Among the difficulties complained of were the differences in interpretation of the definition of adulteration by various courts

and by different analysts, and the severity of the penalties imposed for minor deviations from the law.

The Sale of Food and Drugs act, 1875, attempted to correct the defects of the earlier law. This act avoided the term "adulteration" and attempted to define with some precision prohibited practices. It provided for the compulsory appointment of analysts in the City of London, the vestries, county quarter sessions and town councils or boroughs having separate police establishments. Conflicting decisions in the courts, lack of uniform regulations with respect to sampling and analysis led to endless disputes and considerable injustice in its operation. Since dairy products constituted one of the principal classes of food subject to adulteration, the bulk of the early cases under this act dealt with these products Furthermore, during the decade following the passage of the act, a multitude of butter substitutes made their appearance, and the anguished cries of the dairy industry resulted in the passage of the Margarine act of 1887, which provided for distinctive labelling of butter substitutes.

The need for precise legal standards or definitions for articles of food was apparent in the conflicting decisions of the courts and varied interpretations placed by different analysts on their findings. In 1894 a select committee was appointed to consider the defects of the act of 1875 and recommend remedial measures Its recommendations resulted in the Sale of Foods and Drugs act of 1899, which, unfortunately, was not comprehensive but merely amended and added to the original statute. Subsequently, various amendments designed to strengthen or clarify the provisions of these various laws were enacted.

The Sale of Food and Drugs act, 1875, was the first comprehensive legislation dealing with adulteration. Many of the older statutes, particularly the Adulteration of Coffee act, 1718, the Adulteration of Tea and Coffee act, 1724, the Adulteration of Tea act, 1730, and the Adulteration of Tea act, 1776, were designed more to protect the revenue than to protect the public from fraud and danger to health. In fact it was not until the Bread act, 1836, that a definite departure was made from revenue protection to the protection of the health of the community.

The multiplicity of acts relating to adulteration and the need for revision of the act of 1875 led to the Food and Drugs act, 1928. This act consolidated and repealed the four principal acts bearing the title Sale of Food and Drugs acts; namely, those of 1875, 1879, 1899 and 1927, and the two Margarine and Butter acts of 1887 and 1907. The 1928 act placed responsibility for administration and enforcement of the law on the local authorities, designated "food and drug authorities," who appointed "sampling officers" and public analysts whose duty was to detect violations and present evidence. The penalties invoked for violation were quasicriminal in nature but did not relieve the offender from his ordinary liabilities at common law or under the law of contract.

Unfortunately, the 1928 act only partially relieved the confusion. Purveyors of foods were still subject to a dozen or more special laws and regulations, some dealing directly with adulteration, others passed as agriculture acts and still others falling in the general category of public health laws. Parliament was again called upon in 1938 to consider additional legislation to consolidate these related laws. In 1938 the Food and Drugs act was passed which consolidated, with certain amendments and additions, a number of miscellaneous acts relating to food and drugs. The acts consolidated were the Food and Drugs (Adulteration) act, 1928; the Knackers acts, 1786 and 1844; the Bread act, 1836; part of the Public Health act, 1875; the Milk and Dairies (Consolidation) act, 1915; the Milk and Dairies (Amendment) act, 1922; the Artificial Cream act, 1929; and part of the Public Health (London) act, 1936.

This act dealt principally with foods and was divided into six parts: part I dealt with the composition of food and drugs, unsound food, measures to prevent the contamination of food, notification of food poisoning and sale of meat from knackers' yards; part II with milk, dairies and artificial cream; part III related to bread, flour, margarine, butter, ice cream, horseflesh and shellfish; part IV to the importation of food; part V dealt with markets, slaughterhouses and cold-air stores and part VI with administration of the act, legal proceedings and other miscellaneous matters.

The Food and Drugs act, 1938, like its predecessors, did not define adulteration *per se,* but prohibited the addition of substances to foods so as to render the food injurious to health and prohibited the addition of any substance to a drug so as to affect injuriously its quality or potency. The act further prohibited the abstraction of any constituent of a food so as to affect injuriously the nature, substance or quality of the food, except that such altered food could be sold if the purchaser was advised of the alteration and the food complied with pertinent regulations governing food standards. Considerable attention was devoted to prescribing sanitary facilities in food-handling establishments and to prohibiting practices which might result in contamination of the food with filth, spoilage or other changes which might adversely affect its quality. Authority was provided for inspection, sampling and analysis of food; and penalties for violations of the statute and regulations were set forth. Medical practitioners were required to report in detail to the local authorities all cases of suspected food poisoning, and the appropriate local medical officers required to make suitable investigations of all such cases, placing the suspected food under an embargo until the investigation was completed

Milk and other dairy products were dealt with at length in the act of 1938. The minister of agriculture and fisheries was empowered to promulgate regulations defining adulteration of milk and the councils of counties and county boroughs to enforce the act, except in London where this power was placed in the hands of the food and drug authorities.

The enforcement of the Food and Drugs act, 1938, rested with the various local authorities and food and drug authorities, as defined in section 64. These authorities were, in general, the local county or borough councils. They were required to appoint qualified public analysts and provide facilities for bacteriological and other examinations of samples of food and drugs. Penalties were provided for violations of the act and legal procedure for prosecutions, appeals and other punitive measures were outlined.

**Legislation in the United States.**—The earliest enactment of the U.S. congress dealing with adulteration was the Flour Inspection Act for the County of Alexandria, in the District of Columbia, passed in 1824. Subsequently, congress enacted other local food and drug laws which applied principally to the District of Columbia and dealt with individual foods or drugs. The first general statute enacted by congress which dealt with adulteration was the Edwards bill of 1848 prohibiting the importation of adulterated drugs. It was not until 1890 that a similar bill, the Edmunds bill, prohibiting the importation of adulterated food, was enacted.

In 1880 a concerted attempt was made to enact legislation regulating interstate traffic in foods and drugs. Between 1880 and 1906 a total of 103 bills were introduced into congress, none of which was passed by both houses; but their various provisions set a pattern for the legislation which culminated in the Food and Drugs act of 1906. The factors responsible for the enactment of this act stemmed from a long series of investigations of adulteration of foods and drugs started by the department of agriculture in 1879. In 1880 Peter Collier, then chief chemist of the division of chemistry of the department of agriculture, recommended the enactment of a national food and drug law. He stated: "A law, carefully framed, is greatly needed in this country, where adulteration and substitution are every day practised." He further observed: "Laws should be made and vigorously enforced making the adulteration of foods and medicines a criminal offense. Where life and health are at stake, no specious arguments should prevent the speedy punishment of those unscrupulous men who are willing, for the sake of gain, to endanger the health of unsuspecting purchasers."

The man whose spectacular investigations so aroused public opinion that legislation was actively considered by congress was Dr. Harvey W. Wiley. Wiley became head of the division of chemistry in 1883 and immediately began a series of investigations on adulteration culminating in a series of reports characterized

by Pres. Grover Cleveland in 1888 as "the most complete treatise on that subject that has ever been published in any country." These investigations included a basic study of the addition of preservatives, colours and other substances to food and a study of methods to analyze foods and determine their adulteration. He organized among members of the bureau of chemistry (formerly the division of chemistry) the "poison squad" to which preservatives and other suspected adulterants were fed in order to determine their dietary value and harmful effects. Wiley also instituted a popular crusade, lecturing and writing for the popular press, organizing national pure food congresses and using every available means to arouse public opinion to promote legislation. So successful were his efforts that the Food and Drugs act was passed by congress by an overwhelming vote and signed by Pres. Theodore Roosevelt on June 30, 1906.

The act of 1906 set forth in rather specific language a statutory definition of adulteration. In the case of drugs recognized in the United States *Pharmacopoeia* or *National Formulary*, the standards set forth in these compendia were made yardsticks whereby the drugs were measured. Unfortunately, the act went on to specify that drugs could differ from these standards and not be deemed adulterated if the standard of strength, quality or purity were plainly stated on the label. Hence, persons ignorant of the significance of the standards could still purchase inferior articles, believing them to be of standard strength or quality. If a drug was not recognized in one of the official compendia, it was deemed to be adulterated if its strength or purity fell below the professed standard or quality under which it was sold. This provision was also open to abuse since it was not illegal to place two, three or more times the stated amounts of the ingredients in a drug preparation. In the case of potent or toxic drugs, serious reactions or poisoning could, and occasionally did, occur.

Confectionery was prohibited from containing terra alba, barytes, talc, chrome yellow or other mineral substances, or poisonous colour, flavour or other ingredients detrimental to health, or any vinous malt, spirituous liquor or compound or narcotic drug. Prior to the enactment of this law, the substances mentioned had been common adulterants of candy, and many children had been harmed or died as a result of consuming adulterated confections.

The adulteration of food was defined to prohibit the addition of substances which might reduce or lower or injuriously affect the quality or strength of the food; prohibit substitution, in whole or in part, of any substance; prohibit the abstraction of valuable constituents; prohibit the use of colour, coatings or other devices designed to conceal damage or inferiority; prohibit the addition of poisonous or deleterious ingredients; and prohibit filth and decomposition in food products.

Although these provisions seemed adequate in 1906, it soon became apparent that unscrupulous manufacturers could circumvent the purpose of the statute. For instance, foods which contained poisons which were natural ones rather than added during the course of production, processing or manufacture were exempt from punitive action. Foods which might become contaminated with dangerous disease organisms could be shipped with impunity if it could be shown that no filth or decomposition were present. One of the most serious loopholes in the law was the so-called "distinctive name" provision which provided that a food not containing an added poisonous or deleterious substance would not be deemed adulterated if sold under its own distinctive name. All an unscrupulous manufacturer needed to do was to adopt a distinctive name for the article; and he could, within limits, formulate any mixture he wished, vary the composition from day to day if he so desired and otherwise defraud the purchaser with impunity. This became a common practice in some quarters of the food industry.

The penalties provided by the statute for violation of its provisions were of two kinds. A criminal provision in section 2 provided a maximum fine of $200 for a first offense for interstate shipment of an adulterated or misbranded food or drug or the receipt thereof and the delivery or offer of delivery in the original unbroken package for pay or otherwise of the adulterated or misbranded article. Subsequent offenses carried a maximum penalty of $300 or a year's imprisonment or both.

Section 10 provided for the seizure of interstate shipments of adulterated or misbranded articles by the United States marshal upon court order issued on a writ of monition attested by the United States attorney. This procedure removed the offending articles from the channels of commerce pending litigation of the issues involved. The seizure provisions were directed against the offending goods, and the responsible person or persons could ignore the entire procedure if they so chose. No penalty, other than loss of the goods by condemnation and such unfavourable publicity as might occur, was assessed against the person or firm responsible for the violation. The penalty provided by the criminal statute was nominal in character, and some firms regarded it in the light of a license fee to do an illegal business.

Although the Food and Drugs act was amended several times during the 32 years it was in force, these amendments did not alter materially the provisions dealing with adulteration. The defects already mentioned and others relating to the misbranding provisions of the law became more serious as technological developments in the food industry and the pharmaceutical industry created problems not contemplated by the framers of the original act. The development of a wide variety of packaged, prepared, preserved and canned foods created numerous opportunities for fraudulent practices not covered by the existing laws; and these opportunities were quickly seized upon and exploited by the less scrupulous dealers. New and more potent drugs were discovered and their control required greater technical skill; their potentialities for harm, if improperly prepared, labelled or distributed, increased enormously. The act of 1906 was found to be inadequate to cope with these modern developments.

Beginning about 1933 a series of bills was introduced in congress under the sponsorship of Sen. Royal S. Copeland of New York, providing an entirely new food and drug law. Although considerable support for new legislation was received from consumer groups and the department of agriculture, a powerful lobby prevented the passage of any bill to alter the Food and Drugs act, and it was not until a major tragedy occurred in 1937 that public opinion became sufficiently aroused to force congress to enact remedial legislation.

During Sept. and Oct. 1937 at least 73 persons died after taking a drug known as "Elixir Sulfanilamide." According to the U.S. *Pharmacopoeia*, an elixir is an alcoholic solution, but the product distributed as "Elixir Sulfanilamide" consisted of sulfanilamide dissolved in diethylene glycol, a poison which produces profound kidney and liver damage. The Food and Drugs act contained no provisions prohibiting the distribution of poisonous or dangerous drugs. The definition of adulteration did not encompass the sophistication of this product, and it was only because the manufacturer chose to call this mixture an "elixir" rather than a "solution" that the Food and Drug administration could remove the offending article from the channels of commerce. This tragedy was widely publicized and was one of the important factors in securing enactment of the Federal Food, Drug and Cosmetic act which became law on June 25, 1938.

The Federal Food, Drug and Cosmetic act contained many provisions not found in its predecessor. It prohibited foods dangerous to health; it also prohibited foods, drugs or cosmetics in insanitary containers or contaminated because of insanitary conditions of preparation. Under the old law dangerous foods were prohibited only when the danger came from an added ingredient. Under the new law the food was prohibited if the dangerous ingredient was contained in the food.

Added poisons in food were permitted if addition was necessary in good manufacturing practice, and if the amount added was within tolerances established by the federal security administrator. Metallic trinkets and nonnutritive substances in confectionery were forbidden. The distinctive name and "compound" exemption of the 1906 act were omitted; hence foods with distinctive names were not exempt from adulteration or misbranding provisions of the act. Drugs purporting to be among those officially recognized under [illegible] of the U.S. *Pharmacopoeia*,

*Homeopathic Pharmacopoeia* or *National Formulary* had to have listed on their labels any differences of strength, quality or purity from the official standards laid down by these compendia. Slack filling of containers was prohibited and deceptive containers were prohibited.

The penalties for violation of the provisions of the new act were substantially increased over the old law and included seizure of the offending article, criminal prosecution of the responsible shipper with maximum penalties of a fine of $1,000 or a year in jail, or both, for each violation charged; and in the case of intentional fraud or a second offense, a fine as high as $10,000 or a jail sentence of three years or both could be imposed. In addition, the courts were empowered to issue injunctions restraining persons from further violations of the act.

The enforcement of the Federal Food, Drug and Cosmetic act rested with the administrator of the Federal Security agency. An integral part of this organization is the Food and Drug administration, headed by a commissioner, an associate commissioner and one or more assistant commissioners. In order to detect violations and to enforce the law more effectively, the United States was divided into three inspection districts with offices in New York city, Chicago and San Francisco. These districts were abandoned in 1948 and their administrative functions transferred to Washington Inspection stations consisting of offices and laboratories with a staff of inspectors, chemists and administrative personnel were set up in Atlanta, Baltimore, Boston, Buffalo, New York, Philadelphia, Chicago, Cincinnati, Kansas City, St. Louis, Minneapolis, New Orleans, Denver, Los Angeles, San Francisco and Seattle. In Washington, D.C., were located the administrative offices and certain technical divisions and their laboratories, comprising the cosmetic division, food division, chemistry division, medical division, microbiological division, division of antibiotics control, division of pharmacology, division of state co-operation and the vitamin division. These divisions were established to supply technical information needed for the enforcement of the law and for the promulgation of regulations.

When a violation of the act is suspected, samples of the offending goods, together with documentary records showing the interstate character of the shipment, are collected by the inspectors and transmitted to the station in the territory in which the shipment originated. Analysis of the sample may be made at the station or by a technical division in Washington. If a violation is detected, a recommendation for appropriate action is forwarded by the station to the administrative headquarters in Washington. If punitive action is warranted, a statement of the facts and a recommendation is forwarded to the appropriate U.S. attorney, whose duty is to prosecute the case in the district court of the United States. Trial by jury may be had upon election by the defendant. Appeal from an adverse decision may be made in appropriate circumstances to the higher courts by either party.

## ADULTERANTS

The oldest and most widely used adulterant is water. It is cheap, easily procurable and one of the most difficult substances to detect, particularly in food products whose natural composition is largely water. Milk, in particular, lends itself to adulteration with water; and in most countries local statutes or ordinances have been drafted to prohibit this type of adulteration, usually by providing for a minimum butter-fat content of whole milk.

**Preservatives.**—The use of preservatives in foods has been practised since time immemorial. Smoking, salting or drying of foodstuffs in order to preserve them was practised by ancient man and is still in use today. The use of chemical preservatives received an impetus during the last quarter of the 19th century when the growth of large cities necessitated the transportation of perishable foods over considerable distances. Modern methods of packing and canning removed the need for preservatives in most foods, but certain foods still require the addition of some substance to retard or prevent natural spoilage.

The use of harmless preservatives to prevent natural decomposition of certain foods may usually be regarded as a legitimate trade practice and does not result in an adulterated product. Nevertheless, the use of preservatives has been grossly abused, to the detriment of both the consumer and the legitimate producer The use of preservatives to conceal damage or inferiority is condemned by most statutes dealing with adulteration The use of toxic or potentially harmful chemicals as preserving agents is also subject to legal restrictions in most countries. Furthermore, quantities of chemical preservatives in one food may be harmless to the consumer but when added to the quantities found in other foods may lead to serious impairment of health. The presence of a fluorine-containing spray residue on apples may not be injurious if the quantity is less than five milligrams per pound, but if the consumer of the apples lives in an area where the water supply contains one milligram of fluorine in the average daily quantity of water consumed, mottling of the tooth enamel may occur In this instance drinking the water without consuming the apples would have no deleterious effect.

Good manufacturing practice may still require the use of preservatives. Thus, even the most rigid inspection of tomatoes used for catsup cannot prevent the introduction of mould spores into the product. It is necessary to use a preservative such as sodium benzoate to prevent the development of mouldy decomposition In most areas of the United States apples and pears cannot be grown successfully without the use of insecticidal sprays. Washing procedures which do not harm the harvested fruit do not remove all of the spray residue. Hence, it was necessary for the federal security administrator to establish maximum tolerances for the presence of certain potentially harmful ingredients of insecticidal sprays on these products.

In considering, therefore, whether the presence of a preservative results in the article's becoming adulterated, one must consider the nature of the preservative, the amount present, whether the use of the preservative could be avoided by good manufacturing practice and the purpose for which the preservative was added.

**Boric Acid.**—Formerly widely used, boric acid has been largely abandoned as a preservative in both the United States and Great Britain. Its use is deleterious to the consumer, and it has been used in foods for which no preservative was needed if satisfactory manufacturing procedures were followed. Boric acid or borax has been used as a preservative in butter, cream, ham, sausages, potted meats, cured fish and in home-canned fruits and vegetables. It is not an especially effective preservative and will not hide any traces of decomposition which have already taken place. Its use is unnecessary since the foods to which it has been added can be adequately protected from decomposition by careful preparation and adequate processing during manufacture.

Although large single doses of boric acid or borax may be ingested with impunity, smaller doses taken over a long period of time may produce deleterious effects. Amounts of one-half gram of boric acid are harmless, but larger doses, from two to five grams or more, may produce a gastroenteritis, kidney damage and collapse. The continued daily consumption of amounts as low as one-half gram, amounts which could conceivably be ingested during the winter months by a person subsisting on preserved foods, may lead to digestive disturbances, loss of weight and interference with absorption of protein and fat. The action of boric acid is cumulative and the symptoms are insidious. Doubtless many cases of chronic boric acid poisoning have gone undetected because of the vague nature of the symptoms. In persons with gastrointestinal disease or kidney disease, the effects of boric acid are intensified.

**Formaldehyde.**—Although wholly unsuited for food preservation, formaldehyde was at one time used as a preservative for milk. By mid-20th century, its use had been prohibited in most countries. Although it is an efficient antiseptic, it is quite irritant to mucous membranes and ingestion; even small quantities may lead to severe burning, gastritis and diarrhoea.

**Salicylic Acid.**—Salicylic acid in a concentration of 1 to 1,000 will inhibit the growth of moulds and yeasts. It has been used mainly in foods and beverages containing sugar and was used more extensively in Great Britain than in the United States, where benzoic acid or sodium benzoate became more popular. In the

quantities usually employed—namely 120 mg per pound in jams and 0 5 g per gallon in beverages—deleterious effects were not observed In large quantities, salicylic acid and its derivatives produce sedation and analgesia; but, unfortunately, nearly 60% of the persons to whom it is administered may show signs of salicylism which consist of tinnitis, deafness, headache, nausea and cardiovascular disturbances. Furthermore, many individuals show an idiosyncrasy to the salicylates which is often manifested by an urticaria and digestive disturbances, even following small amounts. Free salicylic acid may produce a mild gastritis because of its irritant properties

**Benzoic Acid.**—Closely related chemically to salicylic acid, benzoic acid, sodium benzoate and organic esters of benzoic acid have been employed extensively in the United States as preservatives Jams, jellies and catsup are the principal foods in which these preservatives are used. The amounts usually employed are innocuous, and these substances are considerably less harmful than the salicylates.

**Propionic Acid.**—The discovery that certain fatty acids are effective fungicidal agents led to their employment as mould inhibitors in food products. Because of its occurrence in natural foods and because of its innocuousness, propionic acid and its salt, sodium propionate, have been employed in the baking industry to inhibit mould growth in bread and pastries. Although this preservative is relatively harmless, its use may permit the unscrupulous dealer to sell old bread as fresh. It is principally on economic grounds that the use of propionic acid is frowned upon by regulatory authorities.

**Sulphurous Acid.**—Sulphurous acid, applied in the form of sulphur dioxide, was formerly used to preserve meat, beer, juices and dried fruits. Except in preserving dried fruits, the use of sulphurous acid or sulphur dioxide was superseded by other more efficient methods of preservation. In large quantities sulphurous acid or the sulphites may produce nephritis, but such quantities would not ordinarily be found in preserved foods and beverages.

**Monochloracetic Acid.**—About 1943 the citrus fruit growers of the United States discovered that monochloracetic acid in relatively small amounts would serve as an efficient preservative and stabilizer for citrus juices. Overripened fruit and fruit otherwise unfit for use could be converted into juice and its inferiority concealed to some extent by the use of preservatives Monochloracetic acid was found to be deleterious, and in 1945 an epidemic of vomiting and diarrhoea occurred which was associated with the drinking of an orange-type beverage containing this preservative. Its use in the United States was prohibited by the federal Food and Drug administration.

**Thiourea.**—Thiourea is an effective antioxidant and has been employed in pharmaceutical preparations, particularly in ampuled solutions of readily oxidizable drugs as a stabilizer. In 1944 and 1945 experiments by the citrus industry showed that dipping the fruit or spraying it with solutions containing 1% or 2% thiourea would prevent deterioration and preserve the vitamin C content. Unfortunately, it was discovered that the thiourea penetrated the skin of the fruit and, since it is a potentially toxic substance which inhibits bodily oxidation processes and decreases the functional activity of the thyroid, its use was proscribed by the Food and Drug administration.

**Spray Residues.**—The economical production of certain fruits such as apples, pears and peaches requires the use of insecticidal sprays to prevent damage to the crop by insect pests. Under optimum conditions it is not possible to remove all traces of the spray by washing or other means. However, it is possible, by proper procedures, to reduce the quantity of spray residue to levels which will not be injurious to the consumer. The principal substances used as insecticidal sprays are lead and arsenic in the form of lead arsenate, fluorine in the form of cryolite, DDT and other organic compounds such as parathion and benzene hexachloride. All these substances are poisonous if ingested; extraordinary precautions must be taken to keep the concentrations in foods below toxic levels; and, in most cases, none should be present in the finished product. The administrator of the Federal Security agency was empowered under the Federal Food, Drug and Cosmetic act to establish tolerances for poisonous substances when such substances cannot be avoided by good manufacturing practice In 1944 an order was issued by the administrator establishing a tolerance for fluorine remaining as a spray residue on apples and pears of seven milligrams per kilogram of fruit.

Informal tolerances for lead and arsenic spray residues were announced by the Food and Drug administration in 1940. The administration stated that it would not take action against products in which the concentration of lead was 0 025 gr. per pound or less and in which the concentration of arsenic was 0 01 gr. per pound or less. In 1945 the Food and Drug administration announced that no action would be taken against products containing DDT as a spray residue, provided the concentration of DDT did not exceed seven milligrams per kilogram of fruit.

**Other Adulterants.**—Although a wide variety of substances have been used by the unscrupulous to adulterate or debase foods, those employed successfully to any great extent are limited in number because of the ease with which many adulterants may be detected. During World War I and World War II, shortages of many essential foodstuffs developed, particularly sugar, fats and oils. The demand for these substances was met by profiteering manufacturers with a variety of cheap substitutes

Mineral oil was used to replace vegetable oil in salad dressings and other products in which the consumer would have difficulty in detecting the substitution. Some dealers sought to escape the penalties of the law by offering the products for special dietary use and extolling their virtues as nonfattening or as aids in reducing. The two principal objections to the substitution of mineral oil for vegetable oil are the nonnutritious nature of the mineral oil and the interference with the absorption of fat-soluble vitamins, particularly vitamins A and K, from the digestive tract. The use of mineral oil in foods was banned by the federal Food and Drug administration

Saccharin or other nonnutritive sweetening agents have been substituted for sugar in beverages, jams and other naturally sweet products. Although there is no evidence that small quantities of saccharin used are harmful, the loss of food value of sugar is of course economically and nutritionally harmful to the consumer.

Coffee became scarce during World War II, and a variety of substances were substituted in whole or in part for this material. Ground chick peas or ground cereals were the most frequent substitutes, often mixed with a little genuine coffee to provide a faint coffee-like aroma. Tea also has been subject to adulteration. In the United States during World War II, green tea was occasionally found to be nothing but dried grass. Other weeds, barks and plants were used to substitute for or "extend" the short supplies of tea. Shortages of chocolate and cocoa resulted in the adulteration of these products with ground cocoa shells and crude fibre. Starch was also used as an extender.

Drugs do not lend themselves readily to the same type of adulteration as does food. The usual complaint against drugs lies in deviations from standards of strength, quality or purity. Substitution of ingredients seldom occurs. However, in 1944 and 1945 it was discovered that a group of manufacturers of female sex hormones in New York city had devised a method of exploiting the premium price paid for natural estrogens. Natural estrogens consist largely of estrone with very small amounts of estradiol. Estradiol has from five to ten times the estrogenic activity of estrone and may be obtained from estrone by chemical reduction. Manufacturers were selling as natural estrogens, estradiol, made by reducing estrone, to which had been added an inert substance, cholesterol, to reduce the potency to that expected for natural estrogens. A given batch of natural estrogens then supplied from five to ten times as much of the adulterated product, and the substitution was extremely difficult to detect because of the close chemical and physiologic similarities of the products. This fraud was discovered and stopped by legal action of the Food and Drug administration.

**Colouring Matter.**—Artificial colours have both legitimate and illegitimate uses. Harmless colours are frequently used in confections, pastries and ice cream; and if their presence is declared, no deception of the consumer results. However, when an artificial

colour is used to mask inferiority or to imitate a superior and more costly article, the product must be considered adulterated.

Before modern methods of canning and quick freezing, fruits and vegetables were often treated with dyes or similar substances to restore the natural colour lost in processing. Such practices became rare, however, and are usually condemned by the authorities Milk has been coloured with annatto, tumeric and carrot juice to give it a creamy appearance, but most state laws prohibit this practice

Vegetable dyes are usually harmless, but their colours are often impermanent and may be altered by processing. Coal tar or aniline dyes are most frequently used for food colouring Many of these dyes are harmless; but some are potentially toxic, and their use is prohibited by law. Among the toxic dyes may be mentioned the paraphenylene diamine derivatives which may cause oedema of the face, throat and chest as well as severe skin rashes, and certain carcinogenic dyes such as butter yellow which was shown to cause cancer of the liver in experimental animals. In the United States all coal tar dyes must be certified as harmless by the Food and Drug administration before use.

## ARTICLES ADULTERATED

Although almost all foods lend themselves to some form of adulteration, certain foods, because of their economic importance, have been subject to this practice to a greater extent than others. A few typical modern examples are mentioned below.

**Milk.**—Four principal types of adulteration have been practised with respect to milk—addition of water, abstraction of butter fat in the form of cream, addition of a preservative and addition of colouring matter. The composition of whole milk is usually established by local authorities, and these forms of adulteration are universally prohibited. Addition of water and abstraction of butter fat may be readily detected by determinations of butter fat. Most localities require milk to contain at least 3% butter fat, although during certain seasons of the year some cows will give milk of a lower fat content. Large dairies make it a practice to blend milk so that the resultant product always has the same butter-fat content. Thus, rich creamy milk may be added to a milk low in fat to raise it to standard.

**Butter.**—Butter, like milk, is most often adulterated by abstraction of fat In the United States, butter is required to have a minimum fat content of 80%. Butter is also subject to adulteration with mould and filth. This occurs when dirty, partially decomposed or otherwise unfit cream is used in making butter. Such adulteration can usually only be detected by microscopic examination.

**Fats and Oils.**—Lard was subject to widespread adulteration between 1880 and 1890 when U.S. lard imported into England was found to consist largely of a mixture of real lard with cottonseed oil and beef-stearine. Other vegetable fats, such as maize oil, have been used to adulterate lard. Olive oil was frequently found to be adulterated during World War II, and products sold as olive oil often contained nothing but cottonseed or corn oil. Occasionally, even mineral oil was substituted in part for the vegetable oil. Salad dressings and other products composed chiefly of fats and oils have been the subject of fraudulent substitutions, such as the substitution of mineral oil for vegetable oils in these products.

**Flour and Bread.**—Bread is rarely adulterated in either the United States or England. Flour is often bleached by chemical means, the chief agents used being nitrogen peroxide, benzoyl peroxide, chlorine, bromine, nitrogen trichloride, acid calcium phosphate, acid ammonium phosphate and persulphates. Certain of these agents are objectionable because of the poisonous residues which may be left in the flour and because of their marked destruction of essential nutriments. Chlorine, nitrogen peroxide and benzoyl peroxide are among the bleaching agents to which objection has been made.

Because the production of white flour results in the loss of certain vitamins and minerals, encouragement has been given producers to restore the lost constituents. Under authority of the food standards section of the Federal Food, Drug and Cosmetic act, the federal security administrator established standards for the enrichment of wheat flour providing for the addition of the following substances in the amounts indicated.

| | Milligrams per Pound | |
|---|---|---|
| | Minimum | Maximum |
| Thiamin | 2 0 | 2 5 |
| Riboflavin | 1 2 | 1 5 |
| Niacin or niacin amide | 16.0 | 20 0 |
| Iron | 13 0 | 16 5 |
| Calcium | 500 0 | 1,500 0 |

"Enriched" flour must contain these ingredients in the quantities stated; but the addition of other ingredients, not mentioned in the standards, is prohibited even though they may be nutritious

**Tea.**—Instances of adulteration of tea have already been cited In the United States all tea is examined at the time of import and adulterated tea is refused entry. Although common at the turn of the 20th century, adulteration of tea later became rare.

**Coffee.**—Coffee beans are seldom adulterated, but ground coffee lends itself to the fraudulent addition of extenders, substitutes or other adulterants. Chicory, dried peas, caramel and other substances were used to stretch rationed supplies during World War II

**Cocoa and Chocolate.**—Starch in the form of sago flour or arrowroot has been used to adulterate cocoa powder. Red oxide of iron is added to colour the adulterated product and make it appear genuine. Cocoa shells, finely ground or pulverized fibre, are also used to adulterate cocoa.

**Beer.**—Beer was the subject of a famous instance of adulteration which resulted in important legislation in England. In June 1900 there occurred, mainly in the Midlands but also in other parts of England and Wales, an outbreak of an illness variously described as alcoholism, peripheral neuritis or multiple neuritis About 6,000 persons were affected, of whom about 70 died All were beer drinkers; and, after considerable time, Dr E. S. Reynolds of Manchester discovered dangerous quantities of arsenic in the beer. The brewing sugars used by the affected breweries all came from a single source This supplier used sulphuric acid made from highly arsenical iron pyrites during the manufacture of the sugar, and the resultant product was often contaminated with as much as four grains of arsenic per pound.

**Vinegar.**—The principal adulterant of vinegar is acetic acid. Vinegars may be malt or cider vinegars and may be flavoured with herbs such as tarragon. Formerly, much cider vinegar was merely dilute acetic acid, but such forms of adulteration are no longer widely practised.

**Baby Foods.**—Fruits and vegetables intended for infant feeding are chopped and passed through strainers. This so alters their appearance that adulteration by substitution of an inferior grade of produce is difficult to detect. In the case of string beans, carrots, beets and certain other vegetables, microscopic examination may reveal a high proportion of fibrous material, indicating overripe or inferior grades of produce. Bacteriologic and other tests may occasionally reveal the presence of mould or other contamination. Fortunately, vigilance on the part of food and drug authorities keeps this form of adulteration to a minimum.

**Confections.**—Candy has been subject to several forms of adulteration. The chocolate of chocolate coatings is frequently adulterated with paraffin, gelatin or some other cheap extender. Beet sugar or corn syrup is frequently substituted for cane sugar. Starch, gelatin and other substances may be added to fillers in excessive quantities.

Although not strictly a confection, popcorn was the subject of a novel form of adulteration in 1945. A brand of popcorn, widely distributed in the middle western United States, was found to have as much as half its weight made up of mineral oil. Seizure of the product and prosecution of the shipper effectively halted this form of adulteration.

**Nonalcoholic Beverages.**—Soda water, fruit drinks and similar beverages have been the subject of fraudulent adulteration. Grape juice preparations that have never seen a grape, orange drinks that are orange only in colour and beverages in which

saccharin has been substituted for sugar have found their way on the market. Fortunately, however, the instances of such fraudulent acts decreased because of effective law enforcement.

**Other Foods.**—Maple syrups have frequently been adulterated in two different fashions. Pure maple syrup may contain lead derived from the containers used in processing. Modern methods of preparation have largely overcome this dangerous form of adulteration. On the other hand, not infrequently has a mixture of cane or corn syrup with artificial maple flavouring been passed off as "pure Vermont Maple Syrup."

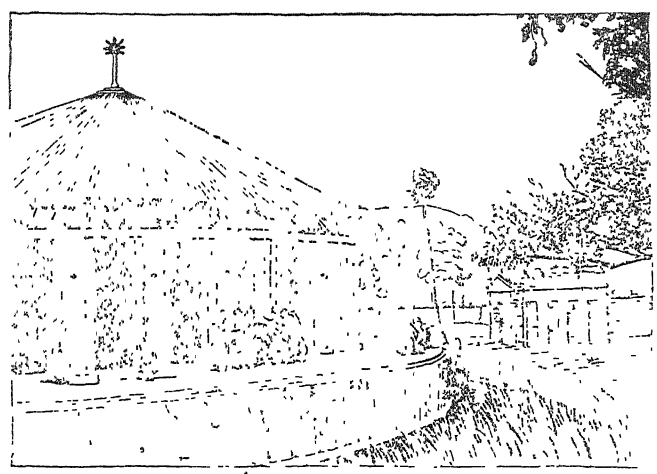
Spices have been subject to adulteration since ancient times and unfortunately, this practice continued In 1946, for example, shipments of black pepper were found to contain large quantities of buckwheat, cottonseed hulls and soybean meal. Horse-radish has been found to contain ground parsnips, and cinnamon bark derived from anything but cinnamon trees resembled the genuine article only in appearance. A shortage of Dutch blue poppy seeds in 1945 resulted in the marketing of India white poppy seed artificially coloured to simulate the more valuable article

**Drugs.**—Drugs are rarely the subject of deliberate adulteration although prior to the passage of the Food and Drugs act of 1906, the United States was flooded with fraudulent cures for the "dope habit" which contained large quantities of morphine or heroin, and with "liquor cures" which were notable for their high alcoholic content. Most cases of adulteration in modern times result from accident and are infrequent One or two such accidents may be cited to illustrate the importance of proper manufacturing controls to prevent accidental contamination.

In late 1940 and early 1941 a large pharmaceutical firm in the United States distributed tablets of sulfathiazole which had become contaminated with phenobarbital, a powerful sleeping drug. At least five persons died directly or indirectly as a result of the administration of these tablets. The accident occurred through the accidental introduction of several scoops of phenobarbital, which was being manufactured simultaneously with the sulfathiazole, into the machine compressing the sulfathiazole tablets. As a result of this accident the firm redesigned its manufacturing quarters so that it would be physically impossible for such an accident to reoccur.

In 1943 a large chemical house inadvertently labelled a drum of cadmium chloride, a poisonous chemical, as calcium chloride. This drum was shipped to a bakery which used calcium chloride for enriching bread. Fortunately, this mislabelling was discovered in time to prevent a serious adulteration.

During World War II a serious shortage of quinine developed since most of the world supply had fallen into the hands of the Japanese. Efforts were made to secure cinchona bark from South America In an effort to capitalize on the demand, unscrupulous South American dealers shipped bark from any tree available, labelling it "cinchona bark." It became necessary for the U.S. government to send analysts to South America to do spot assays on bark submitted for shipment.



Imported crude botanical drugs may be adulterated. Senna, aloes and similar products are sometimes extended by admixture with seeds, straw, fibre, leaves and roots from other plants. Since such shipments are usually inspected and assayed before being passed through customs, the adulteration is detected and entry denied.

For the first time the act of 1938 provided control over adulterated cosmetics. Serious injury to users had occurred in the late 1920s and early 1930s from eyelash dyes containing coal tar dyes. The act of 1938 provided, among other things, that coal tar hair dyes bear a conspicuous statement on the label warning against use in or around the eyes. Poisonous or deleterious ingredients in cosmetics were also prohibited.

V. W.)

**ADULTERY**, the sexual intercourse of a married person with another than the offender's husband or wife (from Lat *adulterium*). Among the Greeks, and in the earlier period of Roman law, it was not adultery unless a married woman was the offender. The foundation of the later Roman law with regard to adultery was the *lex Iulia de adulteriis coercendis* passed by Augustus about 17 B.C (See *Dig.* 48, 5; Paull. *Rec. Sent.* II. 26; Brisson, *Ad Leg. Iul de Adult.*) (*See* DIVORCE.)

**ADUWA** (also called Adowa), in the province of Tigré, Ethiopia, 145 mi. northeast of Gondar and 17 mi. east by north of Aksum, the ancient capital of Ethiopia. Aduwa, a hill slope at an elevation of 6,500 ft., in a rich agricultural district, is an important market centre Pop. 6,500 (est.). On a hill about 2½ mi. northwest of Aduwa are the ruins of Fremona, the headquarters of the Portuguese Jesuits who lived in Ethiopia during the 16th and 17th centuries.

ADUWA, CAPITAL OF TIGRÉ, IS THE CHIEF CENTRE OF TRADE BETWEEN CENTRAL ETHIOPIA AND THE COAST HERE IS SHOWN THE CHURCH OF THE SAVIOUR OF THE WORLD

An Italian invading force was crushed near Aduwa on March 1, 1896. In Oct. 1935 the Italians evened the score by bombing and then capturing the town. It was recaptured by British and Ethiopian troops in April 1941. (*See* ITALY: *Hist.*; ABYSSINIA. *Hist.*)

**AD VALOREM.** The term appropriately used in commerce for a duty which is levied by customs authorities on goods or commodities "according to value." An ad valorem duty is the opposite of a "specific" duty, which is chargeable on the measure or weight of goods. The early English customs tax called "poundage" was an ad valorem duty levied at the rate of one shilling in the pound, or five per cent. In Great Britain in 1927 the duties, commonly called "McKenna Duties," on motor cars, musical instruments, etc., and most of those under the Safeguarding of Industries act, were on an ad valorem basis, and duties of this description were also levied in several British overseas dominions and in the United States of America; in some cases a combined specific and ad valorem duty was leviable, particularly in the United States.

The general practice in the United States is that duty is levied on the foreign export value, *i.e.*, the actual cost at the place of purchase, or the home consumption value in the exporting country, whichever is the greater. It is usual to require at the port of entry the production of an invoice with full particulars of the place where, time when, and the person from whom the goods were purchased, and the actual cost of the goods and any charges on them. Such invoice has to be countersigned by the U.S. consular officer for the district from which the goods are actually destined for the U.S., *i.e.*, place of consignment, not place of shipment. On arrival at the U.S. port of entry the invoice is sworn to by the importer. The definite establishment of the dutiable value is then decided upon by the appraisers at the port of entry, appeal lying to the customs court, formerly the board of general appraisers.

In the British overseas dominions ad valorem duties are usually assessed on the value of the goods in the home trade of the exporting country. In some countries, although nominally ad valorem duties are imposed by the tariff, in practice arbitrary unit values are fixed, either periodically as in the case of Egypt or permanently as in the case of Argentina; the prescribed ad valorem duty is levied on these arbitrary valuations, thus in effect making the duties specific.

It has been argued that, theoretically, an ad valorem duty is preferable to a specific duty, inasmuch as it falls in proper proportion alike on the high-priced and low-priced grades of a commodity, and no matter how the value of any article fluctuates the rate of taxation automatically adjusts itself to the new value. This adjustment has been of particular importance in countries where the currency has been subject to violent fluctuations or where prices have been notably unstable. In practice, however, ad valorem duties may lead to great inequalities and are also difficult to assess equitably; while the relative value of two commodities may remain relatively unchanged under an ad valorem duty, yet owing to the difference in the cost of production, or through the different proportions of fixed and circulating capital employed in their manufacture, an ad valorem tax will be felt much more severely by one commodity than another, from the exporter's point of view. Again, there is always a difficulty in obtaining a true valuation of the exported goods, for values from their very nature are variable.

Ad valorem fees are imposed by some countries (mostly Latin American) on the consular certification of invoices, which are necessary for the clearance of goods through the customs on arrival at the port of destination. These range from 2% to 10%.

The term ad valorem is also used for British stamp duties. By the Stamp Act of 1891, certain classes of instruments, *e g*, bills of exchange, conveyances or transfers, leases, mortgages, etc, must be stamped in England with the proper ad valorem duty, that is, the duty chargeable according to the value of the subject-matter of the particular instrument or writing. (*See* SAFEGUARDING OF INDUSTRY; STAMP DUTY; TARIFFS.)

**ADVANCED GUARD,** the protective detachment pushed forward in advance of an army, or smaller force, moving towards the enemy. Although protective in purpose, its action is largely offensive in order to fulfil its duties. These are to gain information of the position and strength of the enemy's main forces, to deny similar information to the enemy's reconnoitring troops, to brush aside his advanced detachments and so prevent delay to the march of the main body. When the advanced guard eventually comes to grips with the real strength of the enemy, it should fix him securely in order to allow its own main force to deploy and manoeuvre. Gaining time is then as vital as saving time in the earlier phase, and for this purpose the advanced guard may have to resort to attack, defence, or an alternation of both.

The rôle of an advanced guard may be likened to that of an outstretched arm of a man moving in the dark. Flank guards and rear guards are variations of an advanced guard whose names explain their rôles. Outposts are a protective detachment to a force halted.

**ADVANCEMENT,** a term used in English law to describe a sum of money or other benefit conferred by a father or a person *in loco parentis* upon a child by blood or adoption for the purpose of establishing such child in life. It may be considered thus:

1. Advancements during a father's life when the father dies intestate. The law as to this is of very ancient origin but is now summed up for our purpose in ss. 47 1 (iii.) and 49 (a) of the Administration of Estates Act 1925. By the former, when a person who dies intestate has during his life paid money or transferred property to a child of his by way of advancement, or has settled money or property on a child of his on such child's marriage, then, if on the parent's death intestate the child is entitled to a share of the parent's estate, the money or property advanced or settled is to be taken *prima facie* as being so paid or settled in and towards the satisfaction of such child's share of the estate as one of the next of kin, and must be taken into account in apportionating the estate among the issue of the intestate. The value of the advancement is what it is worth at the death of the intestate. By s. 49 (a), where a testator dies partially intestate, any benefits given to the issue of the testator by the will are to be brought into account as if they were advancements in distributing the undisposed of estate among such issue.

2. Double portions. The provisions of s. 49 (a) are really an adaptation of the equitable rule against double portions to cases of partial intestacy. By that rule, where a father or person *in loco parentis* by his will leaves a legacy to a child by blood or adoption and afterwards gives an advancement to such child, then if the advancement was of property of a similar description to that given by the will, the advancement is *prima facie* to be taken as an ademption, total or *pro tanto*, of the legacy. In the same way if the deceased has before he made his will covenanted to advance a certain sum to the child, then if not having made the advancement during his life, he by his will leaves a legacy to the child, or if he dies intestate and the child is entitled to a share of his estate as next of kin, the legacy or the share of the estate is to be taken into account in total or *pro tanto* satisfaction of the debt due by the covenant.

3. Formerly advancements out of the capital of property held in trust for sale for persons absolutely or contingently entitled could only be made by direction of the court. Now they may be made by the trustees at their absolute discretion, provided that no more than one half part of the cestui que trust's actual and prospective share is so advanced, that if the person advanced becomes absolutely entitled to a share of the trust property the amount advanced shall be taken into account, and that no interest in the trust property taking precedence of his share shall be prejudiced by such advancement without the owner's consent in writing (*see* the Trustee Act 1925, s. 32).

**ADVANTAGE,** that which gives gain or helps forward in any way (Fr. *avant*, before). It is often contracted to "vantage." In some games (*e.g.*, lawn tennis) the term "vantage" is used technically in scoring. A position which gives a better chance of success than its surroundings is called a "vantage ground." The term "point of vantage" is used in sport, also generally, to set forth the occupancy, or attainment, of a favourable position for competitive operations of whatever sort.

**ADVANTAGE, MECHANICAL.** Mechanical advantage is obtained by using a machine which exerts a *force* greater than the force applied, and is expressed by the ratio $\frac{\text{force obtained}}{\text{force applied}}$. "Machine" is here used in its widest sense, the simplest form being the lever. (*See* MECHANICS.)

**ADVENT** (Lat. *Adventus*, sc. *Redemptoris*, "the coming of the Saviour"), a holy season of the Christian Church, the period of preparation for the celebration of the nativity or Christmas. In the Ethiopic Church it lasts from Nov. 11, in other churches from the Sunday nearest to Nov. 30, till Christmas. It is uncertain at what date the season began to be observed. A council at Saragossa in 380 forbade the faithful to be absent from church from Dec. 17 to Epiphany; but the first unquestionable mention of Advent is at the Council of Tours (567). It has long been recognized in the West as the beginning of the ecclesiastical year. The Roman Catholic Church forbids the solemnization of marriage during Advent. In many countries Advent was marked by diverse popular observances, some of which still survive. In some parts of England poor women used to carry round the "Advent images," two dolls dressed to represent Christ and the Virgin Mary, visiting every household and demanding halfpence. In Normandy the farmers still employ children under 12 to run with torches through the fields and orchards setting fire to bundles of straw to drive out vermin. In Italy the last days of Advent are marked by the entry into Rome of the Calabrian pifferari who play bagpipes before the shrines of the Holy Mother (as the shepherds of Bethlehem are believed to have done before the infant Saviour).

**ADVENTISTS, SECOND,** members of religious bodies whose distinctive feature is a belief in the imminent physical return of Jesus Christ. (*See* also ESCHATOLOGY.)

**ADVENTITIOUS,** coming from outside, in no sense part of the substance or circumstance (Lat. *adventicius*, coming from

abroad). Carlyle called a man's clothes, or condition of life "adventitious wrappages," as being superadded and not a natural part of him. In botany the word means "out of the usual place," as a root or a bud arising at a point not normal for it.

**ADVENTURE,** a hazardous enterprise. Thus an "adventurer," from meaning one who takes part in some speculative course of action, came to mean one who lived by his wits and a person of no character. The word is also used in certain restricted legal connections. *Joint adventure,* for instance, may be distinguished from partnership (*q.v.*). The *bill of gross adventure* in French maritime law is an instrument making a loan on maritime security. The word was freely used of mercantile enterprises during the colonizing period: hence the title of "Merchant Adventurers." (*See* CHARTERED COMPANIES.)

**ADVERB,** a part of speech modifying or qualifying an adjective, verb or other adverb. According to their function they are divided into adverbs of time, place, quantity, manner, etc.

**ADVERTISING,** the process of disseminating information for commercial purposes. Advertisement has existed from early times. Traders made themselves known and called attention to their products by mural inscriptions before the age of printing: a papyrus, discovered at Thebes offering a reward for a runaway slave, is reputed to be 3,000 years old

The public crier, a civic institution in ancient Greece, is not yet extinct. In the middle ages the spoken word was almost the only mode of publicity in use. The invention of printing ushered in the modern period of advertising. The Bodleian library has a small poster or broadside by William Caxton, 7in. by 5in., advertising a service-book, "The Pyes of Salisbury Use" for sale at the Red Pole in the almonry of Westminster. It was issued in 1480. Printing alone made possible the transition from simple announcement to the system of argument and suggestion which constitutes modern advertising, and the medium of this development was the newspaper. The *Mercuries* or weekly papers sometimes carried a few advertisements, including the first offerings of coffee (1652), chocolate (1657) and tea (1658).

In June 1666 the *London Gazette,* No. 62, announced the first advertisement-supplement, as follows: "An Advertisement—Being daily prest to the publication of Books, Medicines, and other things not properly the business of a Paper of Intelligence. This is to notifie once for all, that we will not charge the *Gazette* with Advertisements, unless they be matter of state; but that a Paper of Advertisements will be forthwith printed apart, and recommended to the Publick by another hand."

In No. 94 of the same journal, published in Oct. 1666, there appeared a suggestion that sufferers from the Great Fire of London should avail themselves of this means of publicity: "Such as have settled in new habitations since the late Fire and desire for the convenience of their correspondence to publish the place of their present abode, or to give Notice of Goods lost or found, may repair to the corner House in Bloomsbury on the East Side of the Great Square, before the House of the Right Honourable of the Lord Treasurer, where there is care taken for the Receipt and Publication of such Advertisements."

Clearly, the restriction of the word "advertisement," which for Shakespeare and the translators of the Authorized Version had meant information of any kind, to a business announcement was in *The Tatler* of Sept. 14, 1710:

"It is my custom, in a dearth of News, to entertain myself with those Collections of Advertisements that appear at the end of all our Publick Prints. . . . Advertisements are of great use to the vulgar. First of all, as they are instruments of ambition. A man that is by no means big enough for the *Gazette* may easily creep into the advertisements. . . . A second use which this sort of writings have been turned to of late Years, has been the management of Controversy. . . . The inventors of *Strops for Razors* have written against one another in this way for several years. The third and last of these writings is to inform the World where they may be furnished with almost everything that is necessary for Life. If a Man has Pains in His head, Cholic in his Bowels, or spots in his Cloathes, he may here meet with proper Cures and Remedies If a Man would recover a Wife or a Horse that is stolen or strayed, if he wants new Sermons, Electuaries, Asses' milk, or anything else, either for his Body or his Mind, this is the place to look for them in."

By the middle of the century, advertising began to be complained of, and the stains which the practice of that age left upon its reputation are not yet quite obliterated. In *The Idler* Jan. 20, 1758, Dr. Johnson has:

"Advertisements are now so numerous that they are very negligently perused, and it is therefore become necessary to gain attention by magnificence of promises and by eloquence sometimes sublime and sometimes pathetick. Promise, large promise, is the soul of an advertisement. I remember a washball that had a quality truly wonderful—it gave *an exquisite edge to the razor!* . . . The trade of advertising is now so near to perfection that it is not easy to propose any improvement."

## PSYCHOLOGY OF ADVERTISING

The psychology of advertising embraces the application of modern psychology to the problems of advertising. Every effect has a cause: human behaviour is just as susceptible of interpretation in terms of cause and effect as are the movements of the heavenly bodies. To understand behaviour one needs to understand its causes, and to control behaviour one needs to get control of its causes. The control of human behaviour in the purchase of goods is the ultimate aim of the advertiser.

**Dynamic Psychology** has disclosed the driving forces of the human machine to be motives, desires, needs and wants. Thus, human beings want food and drink, rest and comfort, protection from danger, comradeship with their fellows, superiority over their rivals, etc. The universal presence of these needs or desires guarantees that only relatively slight stimuli need be applied to set the human being into action in order to satisfy them. The advertiser, knowing these facts, attempts not only to engender action by playing upon these motives, but also to show that his own product will satisfy a fundamental need *more effectively* than any other competing product. We find, therefore, that such a commodity as a tooth paste will be offered as a means of satisfying the desire for cleanliness, for beauty, for protection from disease, for prestige, for success in love, or in business. Other things being equal, that commodity which stimulates into action the most powerful motive will win the market. The use of argument and logic plays a minor role in successful present-day advertising in comparison with the direct appeal to desire.

After the proper appeal is chosen the advertiser is faced with the necessity of presenting it to his readers most effectively. At every step in this process psychological problems are encountered. For instance, in order to attract and hold attention the advertisement must be different from its neighbours; it must be *distinctive.* Now, distinction of a given amount may be attained in a variety of ways and at varying cost, for example, by the use of a large space or by associating it with a novel radio program. But when full-page advertisements are too common, and the use of a given radio technique is too nearly universal, both these devices lose their power of grasping the attention. Many other psychological ways of making the appeal effective are known, such as the influence of a pleasant state of mind, however it may be created, upon the memory; the dependence of the comprehension of a message upon the intelligence level of its readers; the dependence of the effectiveness of the trade names and trade marks of commodities, of packages and other containers upon the ability of the reader to discriminate between them and those of competitors and imitators. All these matters of attention value, of aesthetic quality, of ease of comprehension, of freedom from confusion with imitations and many others have been measured by methods developed in the psychological laboratory. For instance, an adaptation of the familiar free association test has been employed to measure the influence of years of advertising upon the familiarity of certain commodities, trade names and slogans in the minds of the public. By presenting a series of commodity names to a sampling of consumers with the request that they report the first thing suggested

by each, it has been possible not only to determine the relative familiarity of products in the minds of people, but to analyze some of the most important factors that determined their status. On the basis of the intelligence surveys that have been made of the population of the U.S., the advertiser can adjust his story so as to be intelligible to any desired proportion of the population. Any advertising message that is to reach as many as three-fourths of the people of the United States must be expressed in the simplest possible words, with short uncomplicated sentences and, if printed, with the use of pictures whenever feasible.

**Choice of a Medium and a Product.**—The choice of the medium in which the advertisement shall appear, whether it be radio or television, billboard, newspaper, magazine or handbill, and the place where it shall appear in that medium are dependent upon such psychological factors as attitude and interest Is the hurried reader of a morning newspaper in the attitude favourable to the purchase of an article, or is the television viewer sitting in a comfortable chair at home in the evening in a more appropriate attitude? What is the most appropriate time and place to make a favourable impression upon the professional man, the financier, the merchant or the labourer?

More fundamental than all of these matters of the choice of an appeal and its presentation is the part that psychology may play in determining the nature of the actual product to be sold. It is, indeed, no longer necessary to guess at the popular taste. It may be measured upon a sampling of the buying public. The pleasingness of a proposed brand of coffee, a pattern of linoleum, a musical composition or a perfume, as well as the name that shall be given to it, can be, and occasionally is, determined before it is put upon the market through the simple process of taking a census of preferences.

The technique of measuring such subjective data as preferences, likes and dislikes, as developed in the psychological laboratory, is simple and applicable to an almost unlimited range of practical business problems.

**Experimental Studies of Advertising Psychology.**—The earliest studies of advertising problems dealt with attention and how to attract it, as this was considered the primary requisite of successful advertising. Such questions as how big an advertisement should be, how frequently it should be repeated, what colours had proven attention value, and what part of the printed page attracted the most attention were examined in the psychological laboratory (H. Gale, *On the Psychology of Advertising; Psychological Studies,* University of Minnesota, 1900). Problems of the memory value of advertising were then attacked as second only in importance to attention value. For this purpose the laboratory methods for measuring recall, recognition and retention were adopted outright, or in slightly modified form (W. D. Scott, *The Theory of Advertising,* 1903, and H. L. Hollingworth, *Advertising and Selling,* 1913). The application of the "order of merit method" of James Cattell for measuring the value of a whole advertisement introduced a long series of researches of this nature, which have had a profound effect upon the content of the psychology of advertising (E. K. Strong, *The Relative Merit of Advertisements,* 1911).

In later years more complex and less tangible factors affecting advertising success were subjected to experiment. For example, the power of the reader to discriminate among various commodities, advertisements, trade names, etc., was tested with interesting results (R. H. Paynter, *A Psychological Study of Trade-Mark Infringement,* 1920). The feelings and faint emotional states aroused by advertisements and their various components together with the factors that create and strengthen belief, such as positive and negative suggestion, were also measured and evaluated. (*See* A. T. Poffenberger, *Psychology in Advertising,* 1925.) Radio and television advertising was intensively studied by the above techniques or slight modifications of them. Such problems as the measurement of entertainment value of a program, its effectiveness in making a product known, the measurement of value of special features of a program, and the determination of listening habits were partially solved.

## COLOUR IN ADVERTISING

Colour in advertising is as old as the painted signs of inns and shops. Commercial signs and business announcements created by the artist's brush go back several centuries The lithographed poster for advertising purposes, as used in the modern sense, started with Jules Cheret about 1867. In printing (q.v.) the first colour advertisement was for a rug, and was prepared by one of the large mail-order houses. The coloured electric sign followed close on the development of the incandescent lamp about the beginning of the 20th century. The coloured tube lighting (the neon vacuum coloured tube) came into vogue about 1925, and largely revolutionized electrical display signs.

It was the half-tone engraving, when developed into process printing, that made the use of colour practical for periodicals, catalogues, and other forms of printing, but because of mechanical difficulties it was not until about 1910 that the use of colour became common in publication advertising. New iridescent inks that would fuse without blotting out certain tones, highly surfaced papers, and printing presses that would register perfectly all had to be developed before colour advertising became practical About 1920 the first rotary printing press was perfected for process coloured productions. Not until 1937 were the mechanical difficulties overcome to such an extent that it was economically practical to print fractional page magazine advertisements in colour Thereafter it was not unusual to find fully one-half of the advertising space in periodicals printed in colour.

Posters and car and bus (or tram) advertising is more than 90% coloured. Owing to the fact that most poster printing is done by lithography, and that lithography developed colour processing long before it was practical on the letterpress, that form of advertising has practically always been in colour

The first use of colour in advertising was to attract the attention of the reader, but laboratory tests have indicated that adding colour increases the attention value of a display on a magazine page only 13%. As the extra cost of printing in colour is more than 13%, that was unprofitable.

Colour advertising has been strikingly successful: (1) in portraying goods in their actual colours, (2) in giving various articles a setting of richness and a refined atmosphere, (3) in showing the appearance of the package or container, (4) in reproducing trade marks or other distinguishing features.

Colour in advertising is probably a cause as well as an effect of the greatly increased use of colour in dress, in furnishing and decorating the home, in the variety of tones in which automobiles are painted, and even in the selection of finishing materials by architects. New colours in all these applications were so attractively displayed in advertising that the vogue for colour was sped and spread by their vivid illustrations.

As colour advertising became an important commercial factor, psychologists carried on extensive investigations to determine colour preferences, but without much success, in so far as their researches could be applied to advertising. That cool colours—blues and greens—are more attractive for such displays as window trimming in hot weather than reds, yellows and oranges has been shown. That the reverse is true only to a slight degree is something of an anomaly. This same principle has been successful in advertising for summer and winter resorts.

That women once preferred red and men blue was demonstrated for wearing apparel, but it is probably true that tastes have changed. As many red neckties as blue are sold by haberdashers, and more blue than red hats by milliners.

That there is a physiological as well as psychological effect of colour, seems to be established by such popular expressions as "feeling blue," a "gray day," "dark hours," "a drab existence." Also there is the acknowledgment adopted by accountants centuries ago of using blue for the debtor side of the ledger and red for the credit side, as those tones were supposed to be symptomatic of the feelings when incurring and discharging debt.

Psychologists have established helpful combinations of colours in producing the maximum luminosity. The two colours which stand at the top for legibility for the greatest distance are black and yellow; the latter as background. Black on white is the next

most luminous combination.

Also the cool colours used for tinting the walls of a room make it look larger than if in white. Red or yellow make it seem smaller than white. (H. E. A.; X.)

## UNITED STATES

In the United States, the first newspaper was entitled *Publick Occurrences both Foreign and Domestick*, published in Boston in 1690. This was succeeded in 1704 by *The Boston News Letter*, a weekly publication. The first issue of *The Boston News Letter*, published April 26, 1704, contained advertisements. It was 40 years before this publication reached a circulation of 300 copies per issue The early history of advertising, together with numerous sample advertisements of this early period, is well presented in Henry Sampson's *History of Advertising from the Earliest Times* (London, 1875).

The modern period may be dated from about 1850. The reason for putting the dividing point between the early and modern periods at 1850 is the rapid appearance of newspapers and magazines, which made possible the development of modern advertising on a large scale. Advertising was impossible until printing developed and until people generally learned to read One reason for the rapid increase in the number and distribution of advertising media at this time is probably to be found in the development of transportation systems—railways and waterways. Prior to that time railway lines were limited to restricted areas. There was no national transportation system. To illustrate the difficulties of transportation before that time, and even up to 1870 or 1875, we may quote the following announcement of the *Kenosha Telegraph* (Wis.) in Rowell's *Directory* in 1869:

> The town is renowned for the manufacture of wagons, which find a market all the way to the Rocky Mountains, and even to Oregon, being shipped by way of New York.

This shows how difficult it was to distribute goods generally over the country. It is obvious, then, that without the possibility of transporting goods there was no need of advertising media of wide circulation, and furthermore media could not develop a wide circulation because they could not be distributed conveniently or rapidly. During the middle and latter part of the 19th century the development of a national transportation system made possible the ready distribution of goods and publications. About this time also advertising agencies arose whose primary purpose was to serve as brokers of advertising space. They were rather different in this respect from the modern advertising agency, which, in addition to contracting for space, is, in its best form, an organization giving expert counsel and service regarding marketing and advertising plans and methods.

During this period the number of magazines and newspapers grew very rapidly, so that in 1861 there were 5,203 magazines, papers and periodicals of all kinds in the United States. Yet advertising was relatively limited as compared with the modern day. *Harper's Magazine* had its first advertisement in 1864; *Scribner's* in 1872. Magazine advertising on a large scale did not begin until about 1860 to 1870. It was stated in 1926 that *Harper's Magazine* had approximately as many pages of advertising in one year as it had in its first 24 years. At first it was used chiefly as a medium for advertising the Harper publications. Advertising rates at that time began to assume real proportions. *Harper's Weekly* was receiving $35 an inch for its back page in the 1860s.

The first advertising agency was established in Philadelphia in about 1840 by Volney B. Palmer. Later, offices were established in Boston and New York. Rates and contracts were not standardized at that time. The agent contracted for a certain amount of space with a publication and then sold it for whatever he could, receiving sometimes as high as 50% of the cost of the space as his commission. Among the better known early advertising agents were V. B. Palmer, S. M. Pettengill and George P. Rowell. In 1948, according to the U.S. census of business, the United States had 3,279 advertising agencies. About 255, including most of the larger ones, were members of the American Association of Advertising Agencies. (*See* ADVERTISING AGENT or AGENCY.)

**Development of Higher Standards.**—After 1911 advertising developed most rapidly as a standardized business. It was in that year that definite organized steps were taken to forward the movement of truth in advertising In 1911 counsel for *Printers' Ink*, a leading advertising journal in the United States, formulated what became known as "The Printers' Ink Model Statute," which was adopted in a large number of states. This statute made dishonest advertising a misdemeanour.

It (1) placed the responsibility for deception upon the advertiser, (2) dealt with questions of facts about goods rather than opinions, and (3) designated the making of untruthful, deceptive or misleading statements a misdemeanour. By Dec. 1951 this statute had been adopted in 26 states and the District of Columbia in substantially the form in which it was originally prepared by counsel for *Printers' Ink*, and in 17 states in modified form.

The adoption of this statute was a powerful force in bringing deception, misrepresentation and dishonesty in advertising under legal control. The Advertising Federation of America and local advertising clubs and other organizations became active in pushing the adoption of this or similar legislation, which exerted a powerful influence toward the remedying of objectionable practices. In addition to state legislation a number of larger cities adopted ordinances to check certain undesirable advertising practices.

About 1912, the Associated Advertising Clubs of the World at their annual convention adopted the motto "truth in advertising," and established a National Vigilance committee in the United States, later renamed the National Better Business bureau, with the purpose of forwarding higher standards of honesty and reliability in advertising. This committee organized, in connection with the various local clubs throughout the United States, local vigilance committees or Better Business bureaus to eliminate objectionable and untruthful advertising. The purpose of these bureaus has been to carry on locally in each city active efforts, similar to those of the national bureau, toward the elimination of dishonest and objectionable advertising and related business methods. Up to 1952, such bureaus had been established in 85 cities in the United States, including Boston, St. Louis, Cleveland, Indianapolis, Kansas City, Des Moines, Minneapolis, St. Paul, Spokane, Portland, Ore., and New York city. Six cities in Hawaii and Canada had also established bureaus.

An International Advertising conference was held in London in the summer of 1951, at which there was reaffirmed the principle of truth in advertising proclaimed at the first International Advertising conference held at Wembley, Eng., in 1924. The 1951 conference also resolved that advertising must be used increasingly to promote world trade and better international understanding, and that it must "seek its primary justification in service to the consumer by promoting knowledge, helping to reduce the costs of production and distribution, and helping to raise the standards of living."

**Facts About Circulations.**—In 1914 there was organized the Audit Bureau of Circulations. This became the leading agency for securing reliable information about the circulation and distribution of publications. The work of this bureau came about as the result of several organizations which were interested in the endeavour to develop a generally acceptable means of obtaining reliable, standardized statements of circulation. It was felt that the time was ripe for devising such means, and that the advertiser had a right to know what he was buying when he bought space in publications. It was desirable to know not only the total circulation but also something about the various aspects of this circulation, facts which are as important as the statement of the total amount of the circulation.

About 1870 the only facts generally available regarding circulation were the statements in George P. Rowell's *Directory;* and after that time the Ayer *Directory* was the chief source of information. In order to bring about a somewhat more reliable statement of circulations at that time, Rowell added a gold mark to the name of the publication if the publisher made an affidavit concerning his circulation. This was accompanied by an offer of $100 to anyone who could disprove the claim made. In general, the audit bureau reports attempt to answer three main questions:

(1) How large is the circulation? (2) Where does it go? and (3) How was it obtained? The bureau operates by requiring from its publisher members a so-called publisher's statement every six months. The bureau itself makes an audited report once a year.

The Audit Bureau of Circulations became of great value to advertising because it made available reliable statements of circulation covering many different phases. In case of error, either intentional or unintentional, the bureau established certain rules. A publisher or advertiser member of the bureau could ask for a reaudit of any publication, if he so desired. If the reaudit proved that the publisher had misrepresented the facts, the expense was to be borne by the publisher. This fact being then bulletined to the other members of the bureau, the publisher became subject to suspension and expulsion from the bureau. By Aug. 1951, 270 general magazines and periodicals, 72 farm publications, 370 business publications and 1,974 newspapers were members of the bureau. In addition to publications, 485 advertisers and 180 advertising agencies were members.

About 1913 there was organized in the United States the Association of National Advertisers, another important influence in the study and development of advertising practices. Likewise, during that period publishers developed a distinct consciousness of censorship of advertising. A considerable number of publishers took a definite stand with regard to the advertising which they would or would not accept. The announced or stated policy might not be fully lived up to in practice in all instances, but the best evidence of actual progress made in this regard lay in a comparison of mid-century issues of leading magazines and newspapers with issues of the early years of the century. The improvement was marked. In addition to the elimination of objectionable and doubtful advertising, a considerable number of media went a step further by guaranteeing their advertising in the sense that they would either themselves make good on any misrepresentation or deception which appeared in connection with an advertisement, or would see that the advertiser in question made good. With most of the high-grade media a policy of guaranteeing is substantially implied, and is almost unnecessary in view of the commendable care which is exercised in rejecting questionable commodities or irresponsible business houses.

In 1917 the American Association of Advertising Agencies was organized. It contributed materially toward the establishment of standards of practices and uniform methods of procedure. In 1925 it inaugurated a department of research for studying fundamental problems of advertising and marketing. Finally, and perhaps most important, an increasing use of research methods developed. Following World War II the association concentrated on four programs: development of better personnel for advertising; promotion of better research; advocacy of better ethics; and the support of better relations between the public and advertising.

## SUMMARY OF DEVELOPMENTS AFTER 1850

Considering the period from mid-19th to mid-20th centuries as a whole, the chief developments, in addition to those mentioned, may be designated as follows:

**Growth in Quantity.**—There was a tremendous growth in the number of firms employing advertising in one form or another. In 1951 there were about 14,000 firms doing some national advertising. A study by *Printers' Ink* in 1951 listed 222 advertisers spending more than $1,000,000 annually. There was likewise an enormous growth in the number of media. In 1830, it is estimated that there were approximately 800 magazines and newspapers in the United States, of which about 50 were daily publications. Their combined annual circulation was estimated at about 60,000,000 copies, or a circulation of approximately 950,000 copies per issue. In 1830 the total population of the United States was 23,500,000.

In 1861 there were 5,203 papers and magazines for a population of approximately 30,000,000. In 1950 there were 13,492 magazines and newspapers in the United States for a population of about 150,000,000. In other words, there had been an increase of magazines and newspapers since 1861 of approximately 2½ times, whereas the population during the same period of time had increased approximately 5 times; but since 1830 the population had increased more than 6 times, while the number of magazines and newspapers had increased almost 17 times. A more striking increase took place in the total combined circulation. The estimated combined circulation per issue of 270 magazines was (1951) 150,600,000 copies, and the total combined circulation of the newspapers approximately 114,230,000. Thus since 1830 there had been a growth in total combined circulation of all magazines and newspapers from less than 1,000,000 to approximately 265,000,000 per issue.

During that period, also, there developed entirely new media of advertising, including bus and car cards, posters, direct-mail, motion-pictures and radio and television advertising. Street-car advertising did not come into general use until about 1890, when the change was made from horse-drawn cars to electric cars. The mail-order field developed rapidly. Not only did mail-order houses spring up in large numbers during the period, but also business firms of all kinds developed a very extensive use of direct-mail material in the form of circulars, catalogues, letters and so on. The large mail-order houses commonly sent out twice a year more than 14,000,000 large catalogues, in addition to numerous smaller departmental catalogues issued. Figures obtained in 1951 estimated the total approximate amount spent in direct-mail advertising to be $878,754,000.

From the time that commercial radio started in the early 1920s it spread until at the beginning of 1952 there were 42,700,000 homes with radio sets. At the same time, there were about 105,700,000 receivers in use in the United States, a figure that included extra sets in homes, those in automobiles, hotels, bars, stores and institutions, and portable sets. Expenditures for time on the four major networks amounted to approximately $175,000,000 in 1951.

Television had an even more spectacular growth. Sets in use by the public on Jan. 1, 1952, were estimated at 14,500,000, compared with 10,000,000 at the beginning of 1951; 3,950,000 in 1950; 1,000,000 in 1949; 189,000 in 1948, and 16,476 in 1947. From a few television stations on the air in 1947 the number had risen to 108 by the start of 1952. Time charges on the four major television networks were estimated at $125,000,000 for 1951.

**Advance in Quality and Scope.**—During the period under consideration there was a distinct improvement in the quality of advertising. Methods of printing, typography, colour printing, art work and the like greatly advanced. Besides the mechanical improvements there were distinct advances in such essential qualities as accuracy of statement and descriptions, reliability and truthfulness. A widening of the scope of advertising developed rapidly. There was a marked increase in the variety of advertising used. Perhaps the dominating types of advertising which flourished originally—that is, about the middle and latter half of the 19th century—were patent-medicine advertising and circus bills and in general much unreliable, dishonest and objectionable advertising. As developed there is hardly a business or type of commodity for which the printed word is not used as a means of selling. Banks and financial institutions of high grade turned to advertising, finding it profitable to employ in a dependable manner the methods which had been found profitable by unreliable financial houses. Advertising suffered because of the objectionable features which were so prominent in its earlier development. For this reason, undoubtedly, high-grade financial houses and to some extent other types of business were slow to take advantage of the possibilities which it offered, but later they adopted the modern techniques of general advertising.

Public service institutions use advertising to place themselves before the public, to secure the co-operation of the community, and to offer their securities to customers and to others. What is termed institutional or good-will advertising is widely used, not only by banking or similar institutions, but by large firms of all kinds, retail stores and manufacturers. Causes of one kind or another—local, national and international—use advertising to secure publicity and to gain adherents. Churches, charitable institutions, schools, educational endowments, public health bureaus, political parties, candidates and even governments find advertis-

ing a suitable and dignified means of publicity. In industrial disputes, employers and employees alike use advertising to influence public opinion and secure sympathy and moral support.

The development of trade-marks was likewise a conspicuous characteristic of the periods mentioned, particularly of the first half of the 20th century. A large proportion of the trade-marks known throughout the United States and all over the world developed during this time. The development of national and international business made trade-marks virtually a necessity; and advertising became an important means, perhaps the chief means, of making them known to the public. The Lanham Trade-mark act of July 5, 1946, effective in July 1947, established important new principles in the federal legal protection of trade-marks.

**Volume of Advertising.**—Some notion of the immense proportions of advertising may be gained from the amount of money expended and from the amount of space and time used each year for advertising in the United States. It was estimated that in the neighbourhood of $6,500,000,000 was being spent annually for this purpose at mid-20th century. Approximately $1,000,000 was spent annually for advertising any one of a score or more of well-known commodities, as high as $5,000,000 and $8,000,000 being spent in some cases. Or we may gain a concrete idea of the immensity of advertising from the cost of space for single advertisements in some of the leading media. Thus, for example, a page in a well-known monthly magazine in a single issue may cost $18,500 and the back outside cover about $24,000. A page in a well-known weekly publication would run to $18,800, and the back outside cover $24,300. A page in the large metropolitan newspapers costs as high as $4,200. From still another angle the immensity of advertising is indicated by the fact that approximately three-fourths of the cost of maintaining a newspaper or a magazine comes from its advertising space.

The outsider naturally wonders whether advertising with such high rates for space can really be a profitable aid in selling; or whether it may not be an expensive luxury indulged in by large business concerns. The extent to which advertising plays a justifiable role in the distribution of goods is an important and intricate problem which must be dealt with in any important consideration of the subject.

## ARGUMENTS FOR AND AGAINST ADVERTISING

There are wastes in advertising, but there are wastes everywhere in production, in distribution, in personal selling. Economy in the distribution side of business has lagged behind, but distinct advances have been made. Probably the chief sources of waste in advertising are:

(1) The lack of proper co-ordination between advertising and the other phases of a business—lack of co-ordination with distribution, personal sales, plans and production—advertising where there is no distribution, and the like.

(2) The use of inefficient methods—weak, unconvincing and ineffective appeals, poor presentation, ineffective technique, the use of too large space or too small space as the result of guessing instead of finding the facts on which to build and plan. It has been estimated that if every advertising message were made 10% more effective it would mean a saving of $500,000,000 to the business interests of the United States.

(3) The use of advertising for commodities in circumstances in which returns are highly uncertain, or for business ventures which are too hazardous.

(4) The excessive use of advertising in over-keen competition.

(5) The failure to make all advertising literally truthful and dependable. Even if 96% or 97% of advertising were in the main trustworthy and meritorious, the remaining 3% or 4% would weaken the effectiveness of the rest.

(6) The use of advertising for illegitimate business, highly speculative investments, financial frauds or for commodities of doubtful value or actually injurious to mankind.

Improvements are proceeding in all these directions. Fundamentally, these sources of waste are not peculiar to advertising, but are due to the waste and inefficiency in business as a whole. The same sources of waste exist in oral selling—making plans on guesses instead of on facts, not being literally truthful and dependable in every instance, a lack of proper co-ordination with other phases of a business, the waste of time on the part of salesmen, and excessive personal expenditure. Preliminary time studies show that the average salesman uses only about 15% to 50% of his working time in actual selling. Fundamentally these wastes in oral as well as in printed selling are not to be laid upon these two aspects of business, but are due to conditions in business as a whole, to mistaken judgment, to ignorance and moral weakness.

**The Case Against Advertising.**—The actual total amount of money spent on advertising is large. The estimated amount spent in the United States in 1951, for example, was approximately $6,500,000,000.

The questions are: (1) Who pays for it? (2) How far different would be the price of commodities if this expenditure were entirely eliminated? and (3) In what way would the methods of distribution and the cost of distribution be different? The critic assumes that this money is an economic waste and that prices are higher because of it

A second argument is that advertising considerably increased the demand for, and the purchase of, luxuries and semiluxuries such as cameras, beverages, automobiles, radio and television sets, vacuum cleaners and so on.

A third argument is that advertising was responsible to a considerable extent for the increasing and widespread use of packages, cartons, wrappers and labels for a large variety of products. Advertising was responsible to a very large extent for the development of standardized brands and trade-marked articles These wrappers and containers cost money which supposedly is not a part of the price paid for commodities bought in bulk. The argument is that all of this expenditure is added to the price of the product.

**Relative Cost.**—It is found that the amount actually spent for advertising specific commodities differs widely from the amount which the average person thinks is spent. Almost every person who makes a general statement that the prices of commodities are higher because of the advertising, or that the money expended for advertising is wasted, knows little about the actual facts of the relative amount of money expended for advertising a specific commodity. People quite generally have a greatly exaggerated notion of the amount of money spent for printed advertising. An investigation was made to determine the amount which people think is spent for advertising certain commodities. The results of the investigation showed that people generally overestimate from four to five times the amount spent for advertising specific products. For example, the amount spent for advertising a package of a leading food retailing at ten cents was estimated by this representative group of persons as two cents, whereas the actual amount spent by the manufacturer of this food for advertising a single package was three-tenths of a cent, an overestimation of about eight times.

Averages of expenditures for advertising by 119 member companies of the Association of National Advertisers were studied in both 1939 and 1951. The reported advertising expenditures in all industries represented increased substantially between these years, but the increase in sales during the same period was substantially greater. In most cases the proportion of advertising expenditures to sales was small, although in the drugs and cosmetics industry it is traditionally large.

TABLE I.—*Advertising Expenditures as Percentages of Sales*

| Industry classification | 1939 | 1951 |
|---|---|---|
| Agricultural equipment | 2.6 | 0.9 |
| Alcoholic beverages | 6.1 | 5.2 |
| Automotive | 3.4 | 1.4 |
| Building materials | 1.7 | 1.4 |
| Drugs and cosmetics | 28.0 | 28.0 |
| Electrical appliances | 3.0 | 4.7 |
| Food and groceries | 5.0 | 4.3 |
| Home furnishings | 2.9 | 3.8 |
| Industrial | 1.3 | 0.9 |
| Insurance | 0.3 | 0.2 |
| Office equipment | 2.1 | 2.4 |
| Paper manufacturers | 0.9 | 0.8 |
| Petroleum | 1.8 | 1.0 |
| Textiles and clothing | 4.2 | 3.3 |
| Other industries | 4.8 | 5.0 |

The average expenditure for advertising on the part of retailers at mid-20th century was probably less than 3%. Figures showing the average ratio of advertising to sales in small and medium-sized stores for various years between 1943 and 1950 were published by Dun & Bradstreet, Inc., who pointed out that these percentages should not be considered an exact reflection of advertising costs, because of the wide variance among retailers in defining advertising and advertising costs. It is therefore evident

TABLE II.—*Average Ratio of Advertising to Sales for Small and Medium-Sized Retailers*

| Type of store | Percentage |
|---|---|
| Appliance-radio-television dealers | 2 8 |
| Auto accessory and parts stores | 1 2 |
| [illegible] | 1.0 |
| Bakeries (retail) | 1.1 |
| Book stores | 1.6 |
| Camera and photographic supply stores | 1 9 |
| Department stores | 1 8 |
| Drug stores | 0 6 |
| Dry goods and general merchandise stores | 0 8 |
| Farm equipment dealers | 0 7 |
| Furniture stores | 1 9 |
| Hardware stores | 1 1 |
| Meat markets | 0 2 |
| Jewelry stores | 3 6 |
| Liquor stores (package) | 0 3 |
| Men's clothing stores | 3 3 |
| Men's furnishings stores | 0 6 |
| Paint [illegible] stores | 1 8 |
| Sporting goods stores | 2 0 |
| Stationers (commercial) | 1.3 |
| Tire dealers | 1 4 |
| Variety stores | 0 7 |
| Women's accessory and specialty stores | 1.0 |
| Women's ready-to-wear stores | 3 0 |

that while the total expenditure for advertising runs into large figures, the relative expenditure in proportion to the cost of a commodity is small. In other words, if advertising played no part whatever in stimulating the sale of commodities, and if the cost of advertising were therefore directly added to the price of a commodity to the consumer, the price of an article would be almost inappreciably higher. An article selling at $1 00 would have to be sold at $1.04 or $1.05 if advertising were purely a dead expenditure of money. Although the actual expenditure for advertising is relatively small—probably not more than 4% to 5% in the aggregate—even this expenditure would be a serious waste if it produced no economic or social value. The 1% to 3% spent by retailers, or the 2% to 3% spent by manufacturers, would in many instances serve to make the difference between success and failure.

**Effects of Advertising.**—In 1925 a National Distribution conference was held in Washington, D.C., under the auspices of the Chamber of Commerce of the United States. The report of the committee appointed to investigate "Market Analysis—Advertising and Advertising Mediums" gives some information with regard to the point just brought up. The investigation consisted of a survey of articles which had appeared in publications, giving specific data about the effects of advertising on costs and prices to the ultimate consumer; and in addition of a questionnaire which was sent out to a group of national advertisers, requesting specific data showing the effects of their advertising on their costs and prices. The results were tabulated and summarized in part as follows:

From the data available it is hardly possible to make a non-disputative demonstration. Nevertheless, we believe that it can safely be said that the use of effective advertising by national distributors as a general rule produces one or more of the following results:—

(1) Decreases the cost of selling.

(2) Lowers the cost of production on account of increased volume.

(3) Lowers prices to the consumer and thereby raises the standard of living.

(4) As a by-product, aids in the education of the general public.

Data have been obtained from a number of national advertisers to show the effects advertising has had upon the cost of production and the cost of selling, and prices to the consumer. It is realized that changes in business conditions during the past few years and changes in distribution policies within the individual companies make it very difficult to eliminate the variable factors and to prove the effects of advertising. The data which have been collected, however, seemed to indicate conclusively that the first three results named above are brought about by advertising.

In addition to the four results obtained by advertising which have been mentioned above, advertising often has the following beneficial effects for the manufacturer, dealer or consumer.—

(1) Advertising aids in stabilizing production

(2) Advertising aids in [illegible] and quality.

(3) Advertising aids in the simplification of products. (Elimination of unnecessary items in the line)

(4) Advertising helps to prevent fluctuation in prices.

Advertising's outstanding contribution consists of its part in promoting a dynamic, expanding economy, it was concluded by Neil H Borden, professor of advertising in the Harvard Graduate School of Business Administration, in an exhaustive study of *The Economic Effects of Advertising* published in 1942. He said that from a social standpoint advertising's chief task was to encourage the development of new products, and that from the resulting enterprises had come a flow of income that raised the level of material welfare to a point never before known He maintained that since advertising had been largely associated with the promotion of new and differentiated merchandise, a substantial part of advertising costs should be regarded as growth costs incurred in raising the economy from one level to another.

**Summary of Advantages.**—A beneficial effect of advertising has been the reduction of seasonal fluctuation in the volume of business. In certain fields of business, the seasonal fluctuation, if not entirely eliminated, was greatly reduced. The two seasons of buying men's clothing were greatly extended, and the sale of toys, formerly largely confined to the holiday season, became more evenly distributed throughout the entire year. The same was true of fountain pens, millinery, oranges and lemons and other products The result was a reduction in the cost of doing business.

Advertising also aided materially in the standardization of products and quality of goods. This was brought about through the establishment of brand names and trade-marks, which became associated with uniform quantities and qualities in the mind of the public, until the recollection of a brand name of any number of specific products calls up the picture of a certain definite quantity and a certain recognized standard of quality, which the public has been educated to receive when it calls for a product by a specific trade name. Although the establishment of standard packages probably added to the cost of commodities to some extent, it had certain other advantages. It facilitated retailing, requiring less time on the part of assistants in the preparation of products for delivery to the consumer, and it secured a more hygienic handling of goods, particularly foods

The noteworthy advances made in the general level of living, in public taste, in personal and domestic conveniences, and in the general use of cultural agencies, must be attributed in part to the use of the printed word in the form of advertising. Such products as automobiles, radios, vacuum cleaners, better-fitting clothes, better-constructed and designed houses, better-painted houses, evidence the advance made in the level of living, largely as a result of the insistent and continuous force of advertising. There is no doubt that we should very likely have most if not all of these improvements and conveniences without advertising, but probably not so many people would have had them so soon. Printed publicity and radio and television no doubt helped to educate people to want more and better things in food, clothing, housing, personal comfort and enjoyment.

The almost universal reading of magazines and newspapers was made possible largely, if not solely, through advertising, since more than three-fourths of the income of a periodical is ordinarily derived from its advertising space. In this sense, the newspaper or magazine is practically a by-product of advertising. The comparatively small sum charged for a newspaper or magazine —in comparison with the large sum which such magazine or newspaper would cost if it were not for the advertising which it carries —made some form of reading matter available to even the poorest classes of people. Advertising revenue made possible the large-scale production of newspapers, magazines and periodicals of all kinds, the social and educational value of which is beyond esti-

mate. The whole cost of radio and television programs is paid for by advertisers.

It seems to have been found from experience that some products may be sold most economically primarily through personal salesmanship, that some products may be sold to certain classes of people most economically primarily through printed salesmanship, but that probably the great majority of products may be distributed most economically by varied proportions of personal and printed selling and the judicious use of radio's spoken word and television's mass demonstrations. So long as competition is believed to be a desirable factor in human welfare, just so long will competitive means be used. Critics of advertising perhaps may neglect the fact that if advertising were eliminated or abolished, other competitive methods would necessarily be substituted for it. If the use of advertising were eliminated, it is quite likely that its place would be taken in most instances by some form of personal selling, with its accompanying expense. The fact that numerous firms which consistently and continuously used advertising over a long period of years survived from early periods of business activity may be taken as some indication that advertising has been found to be a fairly effective agency of business progress.

## GREAT BRITAIN

Advertising's principal function is to assist in the sale of goods and services and, particularly where it is employed by the state, in the inculcation of ideas. To this end, according to the *Statistical Review of Press Advertising,* about £36,913,899 was spent on the purchase of displayed advertising space in Britain's newspapers, magazines and trade publications in 1950; of the total it is estimated that government advertising alone accounted for £1,209,496. These figures took no account of the cost of filling the columns thus acquired. The Select Committee on Estimates in its 1950 report noted that, in the years 1948–51, an average of £15,000,000 annually was expended on the government information services, covering all forms of official advertising, publicity and promotion through such diverse agencies as the central office of information, the foreign office and the British council.

On the basis of test and experience it is possible to forecast what a particular promotional effort is likely to yield in terms of sales. Market research methods employed by advertising men also enable a manufacturer to estimate the limits of his market, so that he may plan his factory's production. The A. C. Nielson method of retail shop auditing provides manufacturers with information about the movement of their own and competitors' goods from the shops. Where in any specific field of manufacture public preference is seen to be moving in the direction of certain brands, rival manufacturers can adjust their advertising, their packaging or the characteristics of their products accordingly. Over an extensive range of consumer goods (notably packaged foods, drugs and toilet products) sales are continually affected by the fickleness of public taste.

The case for advertising by the state rests on different grounds. If it is to intervene regularly in the day-to-day lives of adult citizens in a democracy, a government must employ all the methods of mass communication available to it to secure their co-operation. This is the argument used to justify large-scale advertising by the state to encourage saving, to persuade parents to have their children immunized against diphtheria, to promote road safety and fuel economy, and so on. There have also been drives, aided by modern publicity, to secure recruits for the armed services and for the police and, through the ministry of food, to explain how to make the best use of rationed foodstuffs. Moreover, the nationalized airways, railways and gas and electricity boards in Great Britain continue the use of advertising for selling and informative purposes started under private ownership. Although the need for advertising by monopolies such as the post office is sometimes questioned it is argued that a monopoly no less than a private organization must create confidence among its clients. The pioneer work of the London Passenger Transport board has been widely commended in this connection Although there had earlier been a limited amount of "official" advertising, notably on behalf of the post office, the British Industries fair and the old Empire Marketing board, it was World War II that provided the greatest impetus for the large-scale use of advertising for government ends.

As a result of the nationalization of Britain's transport after World War II the state became actively interested in the disposal by hire of advertising sites on railway property, inside railway coaches and in and on buses and trams. In 1949 the British Transport commission's net receipts from the sale of advertising space amounted to £2,207,610, its biggest single source on "noncarrying" revenue.

**Agencies and Managers.**—The bulk of the commercial advertising in Britain is placed by specialist firms of advertising agents, who are appointed by advertisers to handle their accounts. Normally no fee is paid by the advertiser for this work, the agent receiving a commission (varying from 10% to 15%) on the cost of the advertising from the newspaper or magazine with which it is placed. In practice agencies charge the client directly for special work, and frequently an extra "service fee" of about 2½% is imposed. The service of a first-class advertising agency to its clients includes direct examination of markets and elaborate research; the designing of packages and wrappings for new articles; the invention of selling plans; the formulation of an advertising policy and its embodiment in press advertisements, posters and other forms of advertising; the preparation of window-dressing designs and materials and of showcards; and contracting with newspapers, periodicals and hoarding-owners for the supply of space. The bulk of the agencies are members of the Institute of Incorporated Practitioners in Advertising, which enforces standards of practice designed to eliminate such unprofessional conduct as the active solicitation of other agencies' accounts.

The agency system enables the owners of advertising media to do business conveniently with thousands of advertisers through about 500 offices centred in the big cities. Also, the agent in his own interests must encourage businesses that may not have used advertising to discover how it can be of value to them. The advertiser likewise gains because, through the agency, he has a call on the services of expert teams whom he could not afford to employ on his own staff.

Nevertheless many bigger advertisers and those operating in technical and specialist fields do run advertising departments of their own which, while working in co-operation with the appointed agents, frequently carry out the bulk of the planning and creative work. The large advertising department is the exception rather than the rule, but regular advertisers nearly always appoint one executive, sometimes a director, known as the advertising manager to act as a liaison between the board and the agency. The Incorporated Advertising Managers' association, to which the leading managers belong, works to secure full recognition of its members' importance.

**Media.**—There are six main methods by which the advertising message can be delivered to the public in Great Britain. These are: the press, which includes newspapers and magazines of all kinds; outdoor advertising, which includes hoardings, *solus* sites, advertising on transport systems, and electric signs; direct mail, which is the professional term for advertising material addressed individually and sent through the post; exhibitions and displays; films and slides in cinemas, theatres and elsewhere; and radio. (In 1951 there was no advertising on the British television service which is controlled by the British Broadcasting corporation. Agitation to secure facilities for advertising programs was being conducted both in parliament and outside.)

Of these the most important is the press. The *Statistical Review of Press Advertising* gives the following figures for the value of space bought in the various departments of newspaper and magazine publishing during 1950: London mornings £10,516,697, London evenings £2,480,810, national Sundays £4,350,572, pro-

vincial dailies £4,810.829, provincial and suburban weeklies £1.417,614, magazines £10,887,276, technical £1,038,719 and trade £1,357,382. In 1950 more than 50 British advertisers spent £75,000 or more apiece on press advertising alone. In some cases individual sums were more than £200,000. for example, Oxydol £299,000, British Railways £240,000, British Electricity authority £225,000, Dreft £213,000 and Wisk Detergent £201,000.

Although the London morning newspapers, sometimes called the "national" dailies, have long been recognized as the major mediums for advertising in Great Britain, they lost something of their pre-eminence after World War II through the vastly extended influence of the mass circulation magazines In the first place the paper or "newsprint" available to newspapers was more severely rationed than was that supplied to magazine publishers; in the second, the exploitation of new printing techniques, especially colour, enabled the magazines to improve their standing with the public. Whereas it had only 17.18% in 1935, the general magazine press had 34 59% of the annual advertising expenditure recorded for 180 different sorts of product in 1949. In the same period the London mornings' share declined from 36.52% to 23.86%.

It has been alleged that, because of their vast expenditure in the press, advertisers exert an influence on editorial policy. However, the report of the Royal Commission on the Press which sat between 1947 and 1949 stated that although individual advertisers occasionally sought to influence newspaper policy or to obtain the omission or insertion of particular news, such attempts appeared to be infrequent and unsuccessful. The same report pointed out that as long as newspapers were sold for less than what they cost to produce they would need a supplementary income and that the sale of their space to advertisers appeared to be one of the least harmful of the possible sources, but that the publication of advertisements was in any case an essential part of the service which newspapers rendered to the community.

The majority of publishers belong to the Audit Bureau of Circulations, which makes available authenticated half-yearly records of individual newspaper and magazine sales. Some publishers issue their own audited certificates. After World War II considerable attention was paid to "readership." Circulation is a vague term, and one purchased copy of a paper may have several readers. The annual *Hulton Readership Survey* charts the extent to which various newspapers and magazines are seen by other readers than the purchaser of each copy. Hulton's study of "advertisement attention values" was an attempt to show what proportion of the readers of a particular publication read the average advertisements therein.

Outdoor advertising is less amenable to analysis, but valuable work was published by Mills and Rockley's, a big firm of British provincial outdoor advertising contractors, and by the London Transport executive. The latter, in *London's Travelling Public* (1950) gave details of the age-composition and the income levels of those whom advertisements on their properties were likely to reach.

More than any other form of publicity, outdoor advertising has been criticized by the general public and in official quarters. Many charges of disfigurement were undoubtedly true in the past; however, as a result of the enlightenment of owners of regular hoardings and sites and, from 1949, the operations of the Town and Country Planning act, such complaints became considerably less valid. Furthermore, town planning authorities have admitted that outdoor advertising has a legitimate commercial function to perform and can be incorporated within planning programs to the advantage of the community. The way in which the modern, soundly constructed hoarding can even make a contribution to local planning arrangements, was demonstrated in the neighbourhood of the South Bank exhibition during the Festival of Britain (1951): a number of unsightly views exposed by rerouting of roads and other reconstruction work around the site were hidden by judiciously placed advertisement hoardings, in some cases set amid miniature gardens and floodlit.

Whereas advertisements in the press are frequently designed to present long and persuasive arguments on the advertisers' behalf, outdoor media, whether posters or signs, are for the most part used to drive home what advertisers call "reminder messages" These consist of the name of the product or service being advertised together with a brief and telling slogan Nicholas Kaldor and Rodney Silverman in *A Statistical Analysis of Advertising Expenditure and of the Revenue of the Press* (1948) estimated that in 1935 approximately £6,500,000 was spent on outdoor publicity.

The poster, by reason of its size and the facilities which it affords for the use of colour, has a powerful effect on the public mind. Announcements can be displayed before more people for a longer time by means of a poster than by the same expenditure of money in the press If, however, more is desired than an instantaneous impression on the mind, the advertising value of the poster falls sharply

Large painted signs on gable ends; sky signs on the roofs of houses; a variety of illuminated signs; mobile devices for shop windows; posters on buses, trams and carriers' vans; the rather antiquated expedient of sandwich-sign men; and motor delivery-vans modelled on the shape of the owner's specialty, enormously magnified, are among other forms of outdoor publicity

A development which, following World War II, added to the attention value of posters of all kinds was the introduction of luminous inks. In electric signs, the continued extension of the neon principle resulted in the remarkable nighttime advertising effects which are such a feature of the entertainment and shopping centres of Britain's big cities, particularly at Piccadilly Circus in London. Equal progress was made in the production of smaller electrical units for use in local shop windows and on counters.

An increasingly popular method of marketing is to advertise for direct orders from the public through the post, and a feature of the popular national newspapers is the space, sometimes as much as a full page, given over to what are called "bargain squares" A typical collection of "bargain squares" will carry offers of clothing and household goods, all of which can be obtained either on the cash-on-delivery principle or by forwarding a cash or postal order for the stated amount to the advertiser, when the line requested will be dispatched to the customer by post. Because this form of trading would lend itself to sharp practice if not strictly supervised, newspapers are at pains to ensure that only reputable dealers are permitted to ply their trade in the paid-for columns.

A variant of the "mail-order" system described above is the unsolicited approach through the post, known as "direct mail." Certain classes of advertising agents specialize in direct mail and devote considerable attention to the compilation of selective mailing lists. In this way an advertiser who wishes to reach certain small groups of people can forward advertising matter direct to any special group, *e.g.*, clergymen, chemists, etc.

Advertising by means of exhibitions and displays called into being a whole range of specialist artists and craftsmen whose talents may be seen at such events as the Motor show and the Radio exhibition or in the windows of the local store. What is known as "point of sale advertising," comprising the window bills, cut-outs, display cards and other forms of promotion supplied by the advertiser to the retailer, may also be included under this heading. The British Display association, representing individuals occupied in the craft of display, and the Display Producers' and Screen Printers' association, representing the majority of the firms engaged in the production of display material, are the moving professional bodies behind this section of the industry.

The possibilities of the newly discovered "magic lantern" as a medium for advertising were recognized at the end of the 19th century when slides were first shown on screens in theatres and music halls. The introduction of the cinematograph led to the production of short moving-pictures, incorporating an advertising message, displayed during the intervals of regular entertainment programs. After the arrival of the sound film this process was further accelerated, and with the increasing use of the portable 16-mm. projector the production of lengthy specialized instructional and documentary films for showing to selected audiences at clubs, canteens and women's institutes—the so-called "non-theatrical" screening—became a favourite weapon in the advertiser's armoury.

At mid-20th century there were approximately 4,800 cinemas in the United Kingdom, with a total seating-capacity of 4,200,000; on an average each seat was being used seven times a week. Of these 4,800 cinemas about 4,300, with a seating-capacity of 3,500,000, were prepared to show advertising films To speak broadly, there are only two types of advertising films shown on British cinema screens. the individual two-minute film and those which run for 12-18 sec. together with others of the same length. For his share in the latter type of production the advertiser might pay approximately £2,500 and for this would be guaranteed 26 weeks' showing in 100 cinemas.

Advertising by means of radio or television—that is, commercial or sponsored broadcasting—has been the subject of severe limitations in Great Britain because of the setup of the broadcasting arrangements These preclude both the use of the British Broadcasting corporation's transmitters for the purpose and the establishment of rival broadcasting stations on British soil In these circumstances before World War II a considerable business had grown up in the use of private broadcasting stations in France, which devoted much of their program time to the transmission of whole sessions recorded in London at British advertisers' expense and intended for listeners in Britain. But all such activity ceased after 1939, and after World War II France abandoned its system of joint state and private enterprise in broadcasting in favour of an official monopoly like the B.B.C's. Radio Luxembourg, however, in the grand duchy of Luxembourg, had also carried British sponsored programs up to 1939 and reverted to this system at the end of hostilities: a powerful new transmitter, beamed on Britain, was opened up in 1951 and began to radiate popular entertainment programs interspersed with advertisers' messages for six hours every night. In Nov. 1951 it was calculated that about 15% of the adult population of the United Kingdom were regularly hearing Luxembourg's broadcasts in [illegible] Broadcasting committee headed by Lord Beveridge, in its report on the future of British radio and television issued in 1951, recommended against the introduction of the sponsoring system in Britain, although Lord Beveridge himself and one other member of the committee thought that there would be no objection to allowing it provided that it was subject to suitable controls.

Usually classified under advertising is the type of activity variously known as press or public relations. In its simpler, earlier form this was undertaken by so-called press agents, generally employed on behalf of entertainment interests, who by means of prearranged stunts sought to get inserted into the non-advertising columns of the press stories and pictures of the activities of film and stage performers—an operation calculated to develop their box-office value. Exploitation of the individual in this fashion continued to go on, but commercial firms, professional organizations and governments also came to use the press, the cinema and the radio to present their views and activities to the world. A public relations officer working for a firm of motor-car manufacturers sees that newspaper motoring correspondents have every facility for reporting on the firm's new models. Similarly the British foreign office through its own press department arranges ministers' press conferences. There is an Institute of Public Relations to which the higher public relations officers belong.

As well as helping to sell goods *en masse* to the consuming public, advertising performs certain less obvious but no less valuable functions Thus there is a considerable amount of "internal" advertising undertaken by manufacturers and aimed at others in the business, generally the retailers and wholesalers. Examples are to be seen in the extensive trade and specialised press, which serves every section of industry, every occupation and every profession. This advertising is often an important adjunct to the consumer campaign: in creating sales among the public a manufacturer must win the favour of those who are to pass his product "over the counter" to the ultimate buyer.

**Organization.**—The central professional body of the advertising industry in Great Britain is the Advertising association. It groups together all the interests—advertisers, advertising agencies and media owners. The majority of the other specialist organizations, such as the Institute of Incorporated Practitioners in Advertising and the Incorporated Advertising Managers' association are affiliated to the Advertising association and thus have a common meeting ground on which to discuss problems. Among the association's objectives are the promotion of public confidence in advertising and advertised goods through the correction or suppression of abuses which undermine that confidence; encouragement of the study of the theory and practice of advertising and the improvement of its technique by the institution of courses of study, holding of examinations and the awarding of diplomas; establishment of the fact that efficient advertising is an essential factor in the marketing of produce and manufactured goods and in the economic life of the country; demonstration of the efficiency of the service that advertising and its associated interests can give to industry and the public; and furtherance of the adoption of standards of practice in the business relations between publishers, agents and advertisers.

One of the most important aspects of the Advertising association's work is to be found in its Advertisement Investigation department, which undertakes to check abuses in the wording and presentation of advertisements. The department regularly issues to the association's members reports on advertising which it considers to be undesirable, and in this way a great many appeals to public cupidity, seemingly innocent to the unpracticed eye but thoroughly disreputable in intent, have been refused admission to the advertisement columns of the serious press.

One instrument whereby the advertising business seeks to keep its house in order is the *British Code of Standards in Relation to the Advertising of Medicine and Treatments,* which has the support of the following organizations: the Newspaper Proprietors Association, Ltd., the Newspaper society, the Periodical Proprietors Association, Ltd., the Proprietary Association of Great Britain, the Advertising association, the Incorporated Society of British Advertisers, Ltd. and the Institute of Incorporated Practitioners in Advertising. The code declares that no advertisement should contain a claim to cure any ailment or symptoms of ill-health and that no advertisement should contain a word or expression used in such form or context as to mean, in the positive sense, the extirpation of any ailment, illness or disease. Treatments or medicines for illnesses which properly require medical attention, misleading or exaggerated claims, appeals to fear, diagnosis or treatment by correspondence, and "money back" offers are all dealt with in the code's recommendations. More specifically the code emphasizes that no advertisement should refer to any medicine, product, appliance or advice in terms calculated to lead to its use for the treatment of a number of specially enumerated illnesses or conditions These "illnesses or conditions" range from alopecia to varicose veins and include many familiar "conditions" such as baldness, arthritis and obesity. There are nine other codes operated by specialist sections of advertising, including the *Code of Standards* subscribed to by members of the Association of Specialized Film Producers (the trade body of the advertising and documentary film makers) the *Code of Standards of Advertising Practice* of the International Chamber of Commerce and the *Standards of Practice* of the Market Research society. A censorship committee of the British Poster Advertising association and the Solus Outdoor Advertising association—two associations of owners of outdoor advertising sites—is powerful enough to suppress any poster calculated to offend public taste or morality.

Representing exclusively the interests of advertisers as such is the Incorporated Society of British Advertisers, Ltd. which, while not affiliated to the Advertising association, frequently co-operates with it on matters of common concern. The I.S.B.A., founded in 1900, is the oldest body of advertisers (as opposed to publishers) and defends the interest of advertisers when they conflict with those of the agencies and the media owners. The I.S.B.A. works to ensure, among other things, that advertisement charges are not pushed up to uneconomical levels. It was the I.S.B.A. that in 1931 secured the establishment of the Audit Bureau of Circulations.

Indicative of the tendency for advertising to assume professional status is the growing reliance placed on examination in the

selection and promotion of staff. Two sets of examinations are conducted: a broad-based paper set by the Advertising association; and a paper concentrating more on agency practice set by the Institute of Incorporated Practitioners in Advertising. Facilities for study are provided by various commercial colleges and also through some of the 32 local advertising and publicity clubs affiliated to the Advertising association. These clubs, in addition to their social activities, arrange talks and debates on advertising subjects and seek to stimulate a sense of co-operation and unity among advertising people of the same neighbourhood. They are autonomous, but most of them send two delegates to the quarterly meetings of the Advertising association's Club Development committee.

**Advertisements in English Law.**—Apart from the provisions for formal notification by advertisement in the *London Gazette* and local papers of a large variety of matters of which the public should be informed, acts of parliament relating to advertisements have generally been restrictive. Nevertheless the principle of the spending of public moneys by government departments, local authorities and public corporations finds widespread acceptance.

Legislation affecting advertising is of two types: (1) that which protects the amenities of the countryside and certain urban areas; and (2) that which protects the public from excessive claims in advertisements.

In the first group the most important piece of legislation is the Control of Advertisements regulations, 1948, made under the authority of the Town and Country Planning act, 1947. Legislation in this field, however, began with the Advertisements Regulations act, 1907, which authorized bylaws by local authorities for the regulation and control of hoardings more than 12 ft. in height and for regulating, restricting or preventing the exhibition of advertisements calculated to affect injuriously the amenities of a public park or pleasure promenade or to disfigure the natural beauty of a landscape. In 1925 the powers were extended to include advertisements that would disfigure or injuriously affect the view of rural scenery from a highway or railway or from any public place or water, or the amenities of any village or of any historic public building or monument, or any place frequented by the public chiefly on account of its beauty or historic interest. The home office prepared model forms of bylaws, and by mid-century more than 100 local authorities in Great Britain had exercised their statutory powers.

Subsequently a series of provisions under various town and country planning acts developed further control of outdoor advertising. Then the Town and Country Planning act, 1947, gave the local authorities full control over all outdoor advertising, except minor groups of it, within their territories. In the special areas that appear to the minister to require special protection on grounds of amenity (*e.g.*, rural), express consent from the local planning authority normally has to be obtained before an advertisement site can be located or constructed; but in certain cases—for instance for advertisements on business premises or for functional advertisements by the other local authorities—consent is deemed, that is, not required express. Such advertisements, however, are strictly regulated, both in special areas and in nonspecial areas, and the local planning authority has the right to challenge them. For instance, advertisements on business premises must relate to the business carried on and to the person carrying it on, including advertisements of the goods sold or the services rendered on the premises. In a special area they must not contain letters or figures exceeding 1 ft. in height and may not be more than 12 ft. above ground level. In nonspecial areas they must not be more than 2 ft. 6 in. in height, or more than 15 ft. above ground level.

A further important provision in the regulations is that outdoor advertisements cannot be displayed without the consent of the owner of the land or building on which it is being displayed. This provision has almost stopped "fly-posting," *i.e.*, posting without consideration of the amenities.

In congested areas further restrictions are often imposed for the greater safety or convenience of those using the streets. Thus, under the London Traffic act, 1924, the minister of transport may within the London traffic area restrict the use of sandwich-sign men and other persons in the street for the purpose of advertisement if they are likely to be a source of danger or to cause obstruction to traffic; and in 1927 the minister, Col. Wilfrid Ashley, forbade the use of displayed vehicles for advertising purposes in certain streets Within the City of London and the metropolitan police district no person may carry on foot or horseback or any carriage in any thoroughfare or public place any advertisement to the obstruction or annoyance of the inhabitants or passengers (London Hackney Carriage act, 1853); and by the Metropolitan Streets acts, 1867 and 1885, no advertisement, except in such form and manner as may be approved by the commissioner of police having jurisdiction in the area, may, within six miles of Charing cross, be exhibited or distributed in any street by any person on foot or riding in any vehicle or on horseback. In the County of London, by the London Building act, 1894, and in areas in which the Public Health Acts Amendment act, 1907, applies, sky signs as defined by those acts are prohibited. By a bylaw made in 1900 under general statutory powers for the suppression of nuisances, the London County council, in great measure as a result of observation made at coroners' inquests, prohibited advertisement by searchlight or flashlight causing danger to traffic in any street "Flashlight" is defined as a light which alters suddenly either in intensity, colour or direction. A large number of bylaws for the regulation of advertisements have been passed in different parts of Great Britain.

Other advertisements are prohibited by statute because they are themselves an evil or because they are incidental to evils which the legislature wishes to suppress. Although moneylending is a legitimate trade, it tends to create abuses unless it is severely restricted. In 1892 the sending of an advertisement to any person under legal age inviting him to borrow money was prohibited Much more drastic restrictions were imposed by the Moneylenders act, 1927. No person might send to any person, except in response to that person's written request, any advertisement containing the name, address or telephone number of a moneylender or inviting him to borrow money from a moneylender or to enter into any transaction involving such borrowing or to apply for information as to such borrowing. A moneylender may, however, advertise in newspapers and at an authorized address by poster or placard, but in each case the act severely limits the contents of the advertisement. Moreover, an advertisement or document sent in response to a written request must show with due prominence the moneylender's authorized name and any other name in which he or a partner was registered under the Moneylenders act, 1900, and must not contain expressions which might reasonably be held to imply that the moneylender carries on a banking business. If the terms of interest are indicated they must be stated at the rate per cent. per annum, or, if otherwise stated, the rate per cent. per annum represented by the interest proposed must also be shown.

By the Larceny act, 1861, advertisements of reward for the return of property stolen or lost must neither indicate that no questions will be asked or inquiries made nor promise to repay the purchaser or pledgee of stolen property. A number of statutes prohibit advertisements relating to betting and lotteries. Prize schemes used for advertising are often illegal, as being lotteries. But if skill contributes to the winning of a prize in a competition, the competition is not a lottery. Indecent and obscene advertisements were penalized by the Indecent Advertisements act, 1889.

The Cancer act, 1939, made it an offense for any person to take part in the publication of an advertisement containing an offer to treat a person for cancer, to prescribe any remedy for it or to give any advice in connection with its treatment. The Pharmacy and Medicines act, 1941, made it an offense to advertise treatments for Bright's disease, cataract, diabetes, epilepsy or fits, glaucoma, locomotor ataxia, paralysis or tuberculosis, or to advertise any article in terms calculated to lead to its use for procuring a miscarriage.

The general law also affects advertisements. False representations, offers to contract, defamatory statements, incitements to crime, contempt of court, breach of copyright and infringement of trade-marks may be contained in advertisements and will be

governed by the ordinary rules relating to deceit, contract, libel, crime and infringement of rights. The courts, however, firmly refused to allow puffing advertisements to become the basis of lawsuits between rival traders and will give a remedy for the disparagement of goods by advertisement only when false statements are made with specific reference to the plaintiff's goods, with intent to injure the plaintiff—and then only when the plaintiff has actually been involved in financial loss.

The law recognizes the value of advertisements to advertisers. Hence for breach of a contract to insert advertisements, damages will be given for the loss of business due to the failure to insert the advertisements. Similarly, where advertisement can be shown to be one of the objects of a contract—as, for instance, where an actor is engaged for a theatre of high repute—loss of publicity may be a substantial element in the damages recoverable for breach of the contract.

A summary of laws and regulations dealing with advertisements in certain other countries is contained in an official return issued by the home office in 1903.

**ADVERTISING AGENT** or **AGENCY,** an individual or an organization engaged primarily in the preparation of advertising and also in giving counsel and assistance in the advertising and merchandising of commodities, securities and services.

Although an advertising agency, Reynell and Son, was founded as early as 1812 in London, Eng., the advertising agent first became a recognized factor in business in the United States. The *Boston Chronotype,* Oct. 16, 1846, wrote, "The newspaper advertising agency of Mr. V. B. Palmer we look upon as just the thing. You have only to step into his office with the notice which you wish to have given the whole people of the United States, and it is done." By 1849 Volney B. Palmer, who had been an editorial writer and later member of the advertising department of the *Pottsville Miner's Journal* (Pa.), had opened offices as an advertising agent in Philadelphia, New York, Baltimore and Boston. He acted as the agent for a number of publishers who paid him a commission of 25% for selling space, although he did not assume liability for the credit extended to advertisers. Palmer pioneered advertising on a national scale. His early competitors included S. M. Pettengill, a former clerk for Palmer, and John L. Hooper, who established the precedent of the agent's assuming the responsibility for paying the publisher.

In 1865 George P. Rowell, who had been a bill collector for the *Boston Post,* inaugurated his "list system." Having bought space on contract wholesale from a number of weekly newspapers, he offered space to advertisers in smaller units at retail rates which were below competitors' rates. He advertised "an-inch-of-space-a-month-in-one-hundred-papers-for-one-hundred-dollars." Although the plan proved successful for Rowell and other agents, it did not survive.

As a result of competition among agents and publishers and the flexibility of advertising rates and contracts, the agents became, in effect, expert space traders and brokers.

As late as 1880, the advertising agents relied upon the advertisers to prepare the text of their advertisements; however, in 1914 the Audit Bureau of Circulations was established, and expert and secret knowledge of circulation figures and bargaining for favourable rates were no longer the principal services offered to clients. National advertisers turned to the agencies for assistance in market research, planning of advertising campaigns and preparation of copy. By 1917, when the American Association of Advertising Agencies was founded, agencies had begun to use, in addition to publications, other media such as direct-mail soliciting and outdoor advertising. They later utilized radio and television.

Services which U.S. advertising agents generally undertook included: (1) conducting marketing researches; (2) making suggestions concerning the most saleable form of a product, including the design of the package and determination of price; (3) assisting in the organization and direction of the advertiser's sales force; (4) preparing the advertising, including copy, catalogues, mailing pieces, radio or television programs, etc., and suggesting the amount of money to be expended, the space or broadcasting time required, and the media to be used; (5) making contracts with publishers or purveyors of advertising space or time; and (6) assisting the advertiser to cultivate the good will of the trade and of the public.

As an organization, serving any number of advertisers, the agency (or agent) usually divides itself into departments as follows: (1) executive, which includes the securing of business and its development; (2) research and plans, which conducts marketing inquiries and investigations, and plans the extent and character of an advertising campaign; and (3) production, which provides for the writing and illustration of advertising copy, and the preparation of the engraving cuts and mats necessary to mechanical reproduction and other details. In addition, many agencies became responsible for the production of radio and television programs, which were designed to appeal to a given market for a product, service or, in some cases, idea.

Although U S. agencies received fees from clients for special services or materials provided, they derived most of their income at mid-20th century from the generally established commission, 15% of the standard rates, which the media voluntarily allowed. Only agencies which met the requirements for "recognition" by various publishers and publishers' associations were awarded the commission by the media owners. Requirements for recognition included agency financial responsibility for obligations to the media owners, which had to be contracted in the name of the agent or agency, and a prohibition against the agency's rebating part of the commission to the advertiser. (*See* also ADVERTISING.)

**ADVICE,** counsel given after consideration, or information from a distance giving particulars of something prospective (*e.g.*, "advice" of an imminent battle, or of a cargo due). In commerce it is a common word for a formal notice from one person concerned in a transaction to another.

**ADVOCATE,** a person called in to plead the cause of another; especially one entitled, as having the right of audience, to plead the cause of another in a court of law. In Scotland the word is used particularly to designate a member of the bar of Scotland (*see* ADVOCATES, FACULTY OF). The lord advocate is the chief law officer of the crown in Scotland. As chief public prosecutor he appoints six members of the bar to be his deputies in the conduct of criminal prosecutions, and they are termed advocate-deputies.

The lawyers who practised in the English courts of common law were never officially known as advocates, the word being reserved for those who practised in the courts of the civil and canon law (*see* DOCTORS' COMMONS). There was formerly an important official termed his majesty's advocate-general, or more shortly, the king's advocate, who was the principal law officer of the crown in the College of Advocates or Doctors' Commons, and in the admiralty and ecclesiastical courts. He discharged for these courts the duties which correspond to those of the solicitor of the treasury (*see* SOLICITOR). His opinion was taken by the foreign office on international matters, and on high ecclesiastical matters he was also consulted; all orders in council were submitted to him for approval. The office may now be said to be obsolete, for after the resignation of Sir Travers Twiss, the last holder, in 1872, it was not filled. Advocate is also the title still in use in some of the British colonies for the chief law officer of the crown.

In the United States the term advocate has no special significance but is used synonymously with such terms as attorney, counsel or lawyer.

In France, the *avocats,* as a body, were reorganized under the First Empire by a decree of Dec. 15, 1810. There is, however, a distinction between *avocats* and *avoués.* The latter, limited in number, act as procurators or agents, representing the parties before the tribunals, draft and prepare all formal acts and writings, and prepare lawsuits for the oral debates. The office of the *avocat,* on the other hand, consists in giving advice as to the law, and con-

ducting the causes of his clients by written and oral pleadings The number of *avocats* is not limited.

In Germany the *advocat* no longer forms a distinct class of lawyer. Since 1879, when a sweeping judicature act (*Deutsche Justizgesetzgebung*) reconstituted the judicial system, the *advocat* in his character of adviser, as distinguished from the *procurator*, who formerly represented the client in the courts, has become merged in the *rechtsanwalt*, who has the dual character of counsellor and pleader.

**Advocatus Ecclesiae.**—In the middle ages the word *advocatus* was used on the continent as the title of the lay lord charged with the protection and representation in secular matters of an abbey. The office is traceable as early as the beginning of the 5th century in the Roman empire, the churches being allowed to choose *defensores* from the body of advocates to represent them in the courts. In the Frankish kingdom, under the Merovingians, these lay representatives of the churches appear as *agentes, defensores* and *advocati;* and under the Carolingians it was made obligatory on bishops, abbots and abbesses to appoint such officials in every county where they held property. The office was not hereditary, the *advocatus* being chosen, either by the abbot alone, or by the abbot and bishop concurrently with the count The same causes that led to the development of the feudal system also affected the *advocatus*. In times of confusion churches and abbeys needed not so much a legal representative as an armed protector, while as feudal immunities were conceded to the ecclesiastical foundations, these required a representative to defend their rights and to fulfil their secular obligations to the state, *e g.*, to lead the ecclesiastical levies to war. A new class of *advocatus* thus arose, whose office, commonly rewarded by a grant of land, crystallized into a fief which, like other fiefs, had by the beginning of the 11th century become hereditary.

In France the *advocati* (*avoués*) were of two classes—(1) great barons, who held the advocateship of an abbey or abbeys rather as an office than a fief, though they were indemnified for the protection they afforded by a domain and revenues granted by the abbey: thus the duke of Normandy was *advocatus* of nearly all the abbeys in the duchy; (2) petty seigneurs, who held their *avoueries* as hereditary fiefs and often as their sole means of subsistence. The *avoué* of an abbey, of this class, corresponded to the *vidame* (*q.v.*) of a bishop. Their function was generally to represent the abbot in his capacity as feudal lord; to act as his representative in the courts of his superior lord; to exercise secular justice in the abbot's name in the abbatial court; to lead the retainers of the abbey to battle under the banner of the patron saint.

The *advocatus* played a more important part in the feudal polity of the Empire and of the Low [illegible] han in France, where his functions, confined to the protection of the interests of religious houses, were superseded from the 13th century onwards by the growth of the central power and the increasing efficiency of the royal administration. They had, indeed, long ceased to be effective for their original purpose; and from the time when their office became a fief they had taken advantage of their position to pillage and suppress those whom it was their function to defend. The mediaeval records, not in France only, are full of complaints by abbots of their usurpations, exactions and acts of violence.

In England *advocatus* was never used to denote the representative of an abbot; but in some of the larger abbeys there were hereditary stewards whose functions and privileges were not dissimilar to those of the continental *advocati.* The word *advocatus,* however, was in constant use in England to denote the patron of an ecclesiastical benefice, whose sole right of any importance was an hereditary one of presenting a parson to the bishop for institution. In this way the hereditary right of presentation to a benefice came to be called in English an "advowson" (*advocatio*).

In Germany the title of *advocatus* (*Vogt*) was given not only to the *advocati* of churches and abbeys, but to the officials appointed, early in the middle ages, by the emperor to administer their immediate domains, in contradistinction to the counts, who had become hereditary princes of the empire. The territory so administered was known as Vogtland (*terra advocatorum*), a name still sometimes employed to designate the strip of country which embraces the principalities of Reuss and adjacent portions of Saxony, Prussia and Bavaria These imperial *advocati* tended in their turn to become hereditary Sometimes the emperor himself assumed the title of *Vogt* of some particular part of his immediate domain. In the Netherlands as well as in Germany *advocati* were often appointed in the cities, by the overlord or by the emperor, sometimes to take the place of the bailiff (Ger *Schultheiss,* Dutch *schout,* Lat *scultetus*), sometimes alongside this official.

*See* Du Cange, *Glossarium* (ed. 1882–87, Niort), s. "Advocati", A Luchaire, *Manuel des institutions françaises* (1892). [illegible] *Realencyklopadie* (ed Leipzig, 1896), s. "Advocatus [illegible] further references will be found.

**ADVOCATES, FACULTY OF,** the collective term employed to designate the members of the bar of Scotland The faculty has grown out of the Scots act of 1532, which established the College of Justice, or Court of Session, in Scotland The advocates had, and still have, the sole right of audience in the Court of Session and High Court of Justiciary. By immemorial custom, they have formed themselves into a self-governing faculty under annually elected office-bearers consisting of the dean of faculty and his council, the vice-dean, the treasurer and the clerk. When properly instructed by a law agent an advocate is, under pain of deprivation of office, bound and entitled to plead in any court in Scotland, civil or criminal, superior or inferior. He is also entitled to plead before the House of Lords, the judicial committee of the privy council and parliamentary committees. The magnificent library collected by the faculty has now been formed into the National Library of Scotland.

**ADVOCATUS DIABOLI,** devil's advocate, the popular name for the promoter of the Faith (*promotor fidei*), an officer of the Sacred Congregation of Rites at Rome, whose duty is to prepare all possible arguments against the beatification or canonization of an alleged saint. This functionary first occurs in connection with the beatification of St. Lorenzo Giustiniani under Leo X. (1513–21). (*See* CANONIZATION.)

**ADVOWSON,** the right of presentation to a vacant ecclesiastical benefice, so called because the patron defends or advocates the claims of the person whom he presents, or because he is the advocate, patron or defender of the church and benefice and is as such given the right to name the priest. At what period the right of advowson arose is uncertain; it was probably the result of gradual growth. The earliest trace of the practice is found in the decree of the council of Orange, A.D. 441, which allowed a bishop, who had built a church in the diocese of another bishop, to nominate the clerk, but not to consecrate the church. The 123rd Novel of Justinian, promulgated about the end of the 5th century, decreed "that if any man should erect an oratory, and desire to present a clerk thereto by himself or his heirs, if they furnish a competency for his livelihood, and nominate to the bishop such as are worthy, they may be ordained." The 57th Novel empowered the bishop to examine them and judge of their qualifications, and, where those were sufficient, obliged him to admit the clerk. In England, for quite two centuries after its conversion, the clergy administered only *pro tempore* in the parochial churches, receiving their maintenance from the cathedral church, all the appointments within the diocese lying with the bishop. But in order to promote the building and endowment of parochial churches, those who had contributed to their erection either by a grant of land, by building or by endowment, became entitled to present a clerk of their own choice to the bishop, who was invested with the revenues derived from such contribution. After the Norman Conquest, it became quite usual for patrons to appoint to livings not only without the consent, but even against the will, of the bishops.

Advowsons are divided into two kinds, *appendant* and *in gross.* The right of presenting, originally given to the person who built or endowed the church, gradually became annexed to the manor in which it was built, and where the right of advowson remains attached to the manor, it is called an advowson *appendant,* and passes with the estate by inheritance or sale without any special conveyance. But where, as is now generally the case, the right of presentation has been sold by itself, and so separated from the

manor, it is called an advowson *in gross*. An advowson may also be partly *appendant*, and partly *in gross; e g*, if an owner granted to another every second presentment, the advowson would be *appendant* for the grantor's turn and *in gross* for the grantee's.

Advowsons are further distinguished into *presentative* and *collative*. In a *presentative* advowson, the patron presents a clergyman to the bishop, with the petition that he be instituted into the vacant living, and the bishop then, if the presentee be a fit clerk, admits and institutes him. In a *collative* advowson the bishop is himself the patron, either in his own right or in the right of the proper patron, which has lapsed to him through not being exercised within the statutory period of six months after the vacancy occurred Collation takes the place of presentation, admission and institution. Before 1898 there were also *donative* advowsons, but the Benefices Act, 1898, made all donations with cure of souls *presentative*. In a *donative* advowson, the patron conferred the benefice by a simple letter of gift, without any reference to the bishop.

The Benefices Act of 1898 did not make any substantial change in the legal character of advowsons, which remain practically the same as before the act. Briefly, it prevents the dealing with the right of presentation as a thing apart from the advowson itself; increases the power of the bishops to refuse the presentation of unfit persons, and removes various abuses. An advowson may, still, be sold during a vacancy, but that will not carry the right to present on the vacancy. But under the Benefices Act, advowsons may not be sold by public auction except in conjunction with landed property adjacent to the benefice; transfers of patronage must be registered in the registry of the diocese, and no such transfers can be made within 12 months after the last admission or institution to the benefice. Restrictions have also been imposed on the transfer of patronage of churches built under the Church Building acts and New Parishes acts, and on that of benefices in the gift of the lord chancellor, and sold by him in order to augment others; but agreements may be made as to the patronage of such churches in favour of persons who have contributed to their building or enlargement without being void for simony.

The Benefices Act, 1898 (Amendment) Measure, 1923, provides that after two further vacancies of the benefice subsequent to the passing of the measure, the right of patronage shall become incapable of sale, and that a patron may anticipate the two avoidances by a registered declaration, and declare the patronage shall from the date of declaration be without power of sale. The measure further provides that if a right of patronage becomes after the date of the measure vested in a clergyman or his wife, or in someone on his or her behalf, that clergyman shall not be presented to the living. There is a further provision in the measure, repealing the act called the Clergy Resignation Bonds Act, 1828, which sanctioned the giving by presentees of a bond to a patron that he would resign the benefice in favour of any one named person, or either of two named persons, if both were related to the patron within certain limited degrees.

The right of presentation may be exercised by the owners, whether they be infants, executors, trustees, coparceners (who, if they cannot agree, present in turn in order of age) or mortgagees (who must present the nominee[1] of the mortgagor), or a bankrupt (*who*, although the advowson belongs to his *creditors*, yet has the right to *present to* a vacancy). Certain owners of advowsons are temporarily or permanently disabled from exercising the right, which devolves upon other persons; and the Crown as patron paramount of all benefices can fill all churches not regularly filled by other patrons. It thus presents to all vacancies caused by simoniacal presentations, or by the incumbent having been presented to a bishopric or in benefices belonging to a bishopric when the see is vacant by the bishop's death, translation or deprivation. Where a presentation belongs to a lunatic, the lord chancellor presents for him. Where it belongs to a Roman Catholic the right is exercised in his behalf by the University of Oxford if the benefice be situate south of the River Trent, and by that of Cambridge if it be north of that river. (For the conditions which make a fit clerk *see* the article BENEFICE.) If the bishop refuses to admit and institute, the patron has his remedy by an action called after the words in the ancient writ *Quare impedit;* that is, the bishop is called upon to show "why he hinders" the patron in the exercise of his right. If the bishop's refusal be due to the fact that there is another claimant to the patronage, that person is also made defendant. If the refusal be because the clerk is alleged to be unfit, the clerk can himself appeal to the court of the metropolitan by a process known as *duplex querela*. The Benefices act also gives to both patron and presentee an alternative mode of appeal against a bishop's refusal to institute or admit, except on a ground of doctrine or ritual, to a court composed of the archbishop of the province and a judge of the high court nominated for that purpose by the lord chancellor, a course which, however, bars resort being had to the ordinary suits of *duplex querela* or action of *quare impedit*.

In case of refusal of one presentee, the patron may present another so long as he does it before lapse.

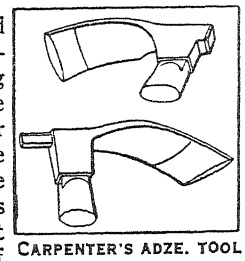
Upon institution the church is full against everybody except the Crown, and after six months' peaceable possession the clerk is secured in possession of the benefice, even though he may have been presented by a person who is not the proper patron. The true patron can, however, exercise his right to present at the next vacancy, and can recover the advowson from an usurper at any time within three successive incumbencies so created adversely to his right, or within 60 years. Collation, which otherwise corresponds to institution, does not make the church full, and the true patron can dispossess the clerk. Possession of the benefice is completed by induction, which makes the church full against any one, including the Crown. If the proper patron fails to exercise his right within six calendar months from the vacancy, the right devolves or lapses to the next superior patron; *e.g.*, from an ordinary patron to the bishop, and if he makes similar default to the archbishop, and from him on similar default to the Crown. If a bishopric becomes vacant after a lapse has accrued to it, the right goes to the metropolitan; but in case of a vacancy of a benefice during the vacancy of the see the Crown presents. Until the right of presentation so accruing to a bishop or archbishop is exercised, the patron can still effectually present but not if lapse has gone to the Crown. (*See* also BENEFICE; GLEBE; INCUMBENT; RECTOR; VICAR.)

*See* J. Mirehouse, *On Advowson* (1824); Phillimore, *Ecclesiastical Law;* J. Bingham, *Origines Ecclesiasticae, or, the Antiquities of the English Church* (1838–40). (P.)

[1] A *nomination* is to be distinguished from a *presentation*. The latter is the legal act, which alone will be recognized by the bishop. But if the legal patron be not entitled, in equity, the true patron nominates him.

**ADWAN,** a Moabite tribe claiming an Arabian origin. They declare that ten generations ago they formed part of a settled population in a fertile district of Arabia and were driven out by invaders much stronger in numbers.

See *The Cambridge Ancient History,* vol. i., 2nd ed. (1924).



**ADY, ENDRE** (1877–1919), Hungarian poet, was born Nov. 21, 1877, at Ermindszent, Transylvania. He was a leader of the modern school and one of the greatest lyrical poets of Hungary. During his youth he became intimate with the publicists and politicians of the Radical and Socialist parties. When he settled down in Budapest he turned his attention towards revolutionary politics and contributed to several Radical papers. He also made prolonged visits to Paris and the Riviera but returned finally to Hungary owing to ill-health, and lived there quietly until his death on Jan. 27, 1919. During the World War he adopted a pacifist attitude, and prophesied the Karolyi revolution of 1918.

**ADYE, SIR JOHN MILLER** (1819–1900), British general, son of Major James P. Adye, was born at Sevenoaks, Kent, on Nov. 1, 1819, and died on Aug. 26, 1900. Sir John Adye served in the Crimean War, in the Indian Mutiny, on the North-West frontier in India in 1863 and subsequently in important commands at home. In 1882 he was chief of staff and second in command of the expedition to Egypt and served throughout the

campaign (G. C. B. and thanks of parliament) He held the government of Gibraltar from 1883 to 1886. Promoted general and colonel commandant of the Royal Artillery in 1884, he retired in 1886. He unsuccessfully contested Bath in the Liberal interest in 1892. He was author of *Recollections of a Military Life* (1895) and other works.

**ADYTUM,** the most sacred part of a shrine, temple or church such as the Holy of Holies of the Temple at Jerusalem, or the cave of the Oracle of Apollo at Delphi, occasionally used for the chancel (*q.v.*) of a Christian church.

CARPENTER'S ADZE. TOOL WITH RAZOR-LIKE EDGE WHICH IS USED FOR CUTTING AND PLANING

**ADZE,** a tool used for cutting and planing. It is somewhat like an axe reversed, the edge of the blade curving inward and placed at right angles to the handle. This shape is most suitable for planing uneven timber, as inequalities are "hooked off" by the curved blade. At the same time, each cut of the adze leaves its own facet, giving a peculiarly wrought effect to work so finished. The beams of old houses, or of new ones finished in an old-fashioned way, show most pleasantly the marks of the adze. *See* TOOL.

**ADZHARIA** (Georgian *Achara,* Turkish *Ajaristan*), an autonomous socialist soviet republic, a zone under the protection of the Georgian S.S.R. Its boundaries are, on the west, the Black sea, on the south, Turkey, on the north and east, the Georgian S S R. Area 1,081.1 sq.mi.; pop. (1933) 153,800: urban 56,365 and rural 97,435. It consists mainly of the former military government of Batum with Ardvin, *i.e.,* the slopes and a portion of the Armenian highlands, drained by the Chorokh river and its tributary, the Acharis-Tsqali, forming deep, picturesque ravines. It is divided for administrative purposes into the following provinces: Adzhar-Tskalsk, pop. 5,524, entirely rural; Kedsk, pop. 10,307, entirely rural; Kobuletsk, pop. 16,996: urban, 1,791, rural, 15,205; Khylosk, pop. 27,172, entirely rural; Chorokh, pop. 59,199: urban, 45,450, rural, 13,749. The climate is "west coast Mediterranean" in type, with southerly and southeasterly rain-bearing winter winds from the low pressure systems over the Black sea. The Caucasus shelters it from north and northeast winds. Rainfall averages 60 in. per annum or more—at Batum 93 3 in. (maximum in November); average temperature January, 43.0° F.; August, 73.8° F. Malaria is prevalent and insect pests, *e.g.,* mosquitoes and locusts, abound. Along the coastal plains from Batum northward are cultivated vine, peach, pomegranate, fig, olive (up to 1,500 ft. above sea level), chestnut, apricot, citrus fruits, apple, pear, plum, cherry, melon and tea, maize (the staple food), wheat (up to 5,000 ft.), potatoes, peas, currants, cotton, rice, colza, tobacco, sunflower seeds and barley. The eucalyptus, mulberry (with silk cultivation), bamboo and ramie are also produced. Much of the republic is forested, the mountain slopes bearing dense forests with a great variety of timber, interspersed with climbing and twining plants and along the plains and lower slopes flowering shrubs bloom, *e g.,* magnolia, azalea, camellia japonica, begonia. Petroleum exists north of Batum, but is not worked much. Batum (*q.v.*), chief city and port, is linked by rail with Baku (on Caspian) and with Kutais and Poti. Pipes convey petroleum from Baku to Batum. Achara was at first a part of the Georgian duchy (after 1463 sovereign principality) of Guria, under the house of Gurieli. After the 16th century it became a part of the Ottoman, and after 1878 a part of the Russian, empire. In 1921 it became an A.S.S.R. (*See* GEORGIA.)

**A. E.:** *see* RUSSELL, GEORGE WILLIAM.

**AEACUS,** in Greek legend, was the son of Zeus and of Aegina, daughter of the river-god Asopus. His mother was carried off by Zeus to the island of Oenone, afterwards called by her name. The island having been depopulated by a pestilence, Zeus changed the ants upon it into human beings (Ovid, *Met.,* vii. 520), who were called Myrmidones (*murmēkes* = ants). Aeacus ruled so impartially that after his death he was made judge of the lower world, together with Minos and Rhadamanthus. His successful prayer to Zeus for rain at a time of drought was commemorated by a temple at Aegina (Pausanias ii. 29), where a festival (*Aiakeia*) was held in his honour

**AECLANUM,** an ancient town of Samnium, Italy, 15 mi E.-S E of Beneventum, on the Via Appia (near modern Mirabella). It became the chief town of the Hirpini after Beneventum had become a Roman colony Sulla captured it in 89 B C. by setting on fire its wooden breastwork, and new fortifications were erected. Hadrian, who repaired the Via Appia from Beneventum to this point, made it a colony; it has ruins of city walls, aqueduct, baths and amphitheatre; nearly 400 inscriptions have been found Two different routes to Apulia diverged at this point, one (Via Aurelia Aeclanensis) leading through the modern Ariano to Herdonie, the other (the Via Appia of the Empire) passing the Lacus Ampsanctus and going on to Aquilonia and Venusia. *See* Ashby and Gardner, *Papers of the British School at Rome,* viii 108 *sqq.*

**AEDESIUS** (d. A.D. 355), Neoplatonist philosopher, was born of a noble Cappadocian family. He went to Syria, attracted by the lectures of Iamblichus, whose disciple he became He taught at Pergamum, his chief disciples being Eusebius and Maximus

*See* Ritter and Preller, 552; Ritter's *Geschichte der Philosophie;* T. Whittaker, *The Neoplatonists* (1901).

**AEDICULA,** a small house or temple, especially the Roman household shrine of the Lares and Penates.

**AEDILES,** the magistrates at Rome who had care of the temples (*aedes*). Created in the same year as the tribunes of the people (494 B C.), they were plebeians, elected, two in number, by the *Concilium Plebis.* Intended as assistants to the tribunes, they exercised police functions and had power to inflict fines. They also managed the plebeian and Roman games. In 367 B.C. an extra day was added to the Roman games. The patricians offered to bear the expense if admitted to the aedileship. Accordingly two "curule" aediles (*see* CURULE) were appointed by the *Comitia Tributa,* at first patricians, then patricians and plebeians in turn and lastly from either class. They managed the Roman and Megalesian games, cared for the patrician temples and issued edicts for the markets. The curule aediles ranked higher than the plebeian, but in time their functions became practically identical These functions fell under three heads: (1) Care of the city—repair, etc., of temples, sewers and aqueducts; traffic regulation and precautions against fire; control of baths and taverns, and general supervision of public morals. (2) Care of provisions—testing of quality and of weights and measures; purchase of corn for disposal in emergencies at a low price. (3) Care of the games—organization of the public games and control of those given by private individuals (*e.g.,* at funerals). These were often used by ambitious persons as a means of gaining popularity. In 44 B.C. Caesar added two patrician aediles, called *Cereales,* for the care of the corn supply. Under Augustus the juridical functions of the office and the care of the games were transferred to the praetor, while its city responsibilities were limited by the appointment of a *praefectus urbi.* In the 3rd century A.D. it disappeared altogether.

**AEDUI** (ī-dŏŏ-ē), HAEDUI or HEDUI, a Gallic people of Gallia Lugdunensis, who inhabited the country between the Arar (Saône) and Liger (Loire). Their territory thus included the greater part of the modern departments of Saône-et-Loire, Côte d'Or and Nièvre. According to Livy (v. 34), they took part in the expedition of Bellovesus into Italy in the 6th century B.C. Before Caesar's time they had attached themselves to the Romans, and were honoured with the title of brothers and kinsmen of the Roman people. When the Sequani (*q.v.*), their neighbours on the other side of the Arar, subjugated them, the Aedui sent Divitiacus, the druid, to Rome to appeal for help, but his mission was unsuccessful. On his arrival in Gaul (58 B.C.), Caesar restored their independence. In spite of this, the Aedui joined the Gallic coalition against Caesar (*B.G.* vii. 42), but after the surrender of Vercingetorix at Alesia (*q.v.*) were glad to return to their allegiance. Augustus dismantled their native capital Bibracte (*q.v.*) on Mont Beuvray, and substituted a new town with a

SKETCH MAP OF THE AREA OF AEGEAN CIVILIZATION

The map shows both modern and classical names. The chief centres of Aegean civilization were in Crete and in the Peloponnese, but its influence extended over a much greater area, including the Aegean islands and parts of the coast of Asia Minor. Its middle period may, with some confidence, be placed 2,000 years before Christ, and its duration covered at least 3,000 years

half-Roman, half-Gaulish name, Augustodunum (mod. Autun). During the reign of Tiberius (A.D. 21), they revolted and seized Augustodunum, but were soon put down (Tacitus, *Ann.* iii. 43–46). The Aedui were the first of the Gauls to receive from the Emperor Claudius the distinction of the *ius honorum*.

*See* A. E. Desjardins, *Géographie de la Gaule* ii. (1876–93); T R. Holmes, *Caesar's Conquest of Gaul* (1899).

**AEGADIAN ISLANDS** (Ital. ISOLE EGADI; anc. AEGATES INSULAE), small mountainous islands off the west coast of Sicily, scene of the defeat of the Carthaginian fleet by G. Lutatius Catulus in 241 B.C., which ended the First Punic War. Favignana (Aegusa), the largest (pop. 6,186 in 1936), lies 10 mi S.W. of Trapani; Levanzo (Phorbantia) 8 mi. W. (pop. 330); Marettimo, (pop. 1,103), the ancient *ἱερὰ νῆσος*, 15 mi. W. of Trapani, is now reckoned in the group

**AEGEAN CIVILIZATION**, the general term for the prehistoric civilization, previously called "Mycenaean" because its existence was first brought to popular notice by Heinrich Schliemann's excavations at Mycenae in 1876, or "Minoan" when Sir Arthur Evans' explorations in Crete from 1899 onwards showed its main source. Subsequent discoveries, however, have made it clear that Crete was its chief centre in its earlier stages, and Mycenae, or the mainland at least, in its later stages; and, accordingly, it is more usual now to adopt a wider geographical title for this culture, which is that of Greece and the Aegean basin in the bronze age.

## I. HISTORY OF DISCOVERY AND DISTRIBUTION OF REMAINS

Mycenae and Tiryns are the two principal sites on which evidence of a prehistoric civilization was remarked by the classical Greeks. The Cyclopean walls of the citadel of Mycenae, its gate with heraldic lions, the great "treasury of Atreus" and the galleries of Tiryns had borne silent witness for ages before Schliemann's time; but they were supposed only to speak to the Homeric, or at farthest a rude Heroic beginning of purely Hellenic, civilization. Only when Schliemann exposed the contents of the graves which lay just inside the gate (*see* MYCENAE), scholars recognized the advanced stage of art to which prehistoric dwellers in the Mycenaean citadel had attained. A good deal of other evidence was available before 1876, but had not been collated and seriously studied. Although it was recognized that certain tributaries, represented, *e.g.*, in the 18th dynasty tomb of Rekhmara at Egyptian Thebes as bearing vases of peculiar forms, were of some Mediterranean race, neither their precise habitat nor the degree of their civilization could be determined while so few actual prehistoric remains were known in the Mediterranean lands. Nor did the Aegean objects which were lying obscurely in museums in 1870, or thereabouts, provide a sufficient test of the real basis underlying the Hellenic myths of the Argolid, the Troad and Crete, to cause these to be taken seriously. Both at Sèvres and Neuchâtel Aegean vases had been exhibited since about 1840, the provenance being in the one case Phylacope in Melos, in the other Cephalonia. Ludwig Ross, by his explorations in the Greek islands from 1835 onwards, called attention to certain early intaglios, since known as "island gems"; but it was not till 1878 that C. T. Newton demonstrated these to be no strayed Phoenician products. In 1866 primitive structures were discovered in the island of Therasia by quarrymen extracting pozzolana for the Suez canal works; and when this discovery was followed up on the neighbouring Santorin (Thera), by representatives of the French school at Athens, much pottery of a class now known to belong to the transition from the middle to the late bronze age, and many stone and metal objects, were found and dated by the geologist Fouqué, somewhat arbitrarily, to 2000 B.C., by consideration of the superincumbent eruptive stratum. Meanwhile, in 1868, tombs at Ialysus in Rhodes had yielded to M. A. Biliotti many fine painted vases of styles which were called later the 3rd and 4th "Mycenaean"; but these, bought by John Ruskin, and presented to the British Museum, were supposed to be of some local Asiatic fabric of uncertain date.

**Schliemann's Excavations.**—Even H. Schliemann's first excavations at Hissarlik in the Troad did not excite astonishment. But the "Burnt City" of his second stratum, revealed in 1873, with its fortifications and vases, and a hoard of gold, silver and bronze objects, which the discoverer connected with it, began to arouse a curiosity which was destined to spread far. As soon as Schliemann came on the royal "shaft graves" at Mycenae three years later, light poured from all sides on the prehistoric period of Greece. The character of both the fabric and the decoration of the Mycenaean objects was not that of any well-known art. A wide range in space was proved by the identification of the island gems and the Ialysus vases with the new style, and a wide range in time by collation of the earlier Theraean and Hissarlik discoveries. A relation between objects of art described by Homer and the Mycenaean treasures was generally allowed, and a correct opinion prevailed that, while certainly posterior, the civilization

of the *Iliad* was reminiscent of the Mycenaean Schliemann got to work again at Hissarlik in 1878, and greatly increased our knowledge of the lower strata, but did not recognize the Aegean remains in his "Lydian" city of the 6th stratum, which were not to be fully revealed till Dörpfeld resumed the work at Hissarlik in 1892 after the first explorer's death. But by laying bare in 1884 the upper stratum of remains on the rock of Tiryns (*q.v.*), Schliemann made a contribution to our knowledge of prehistoric domestic life which was amplified two years later by Chr. Tsountas's discovery of a similar palace at Mycenae. Work at Tiryns was not resumed till 1905, when it was proved, as had long been suspected, that earlier strata dating back to the beginning of the bronze age lie below the palace cleared by Schliemann From 1877 dates the finding of Mycenaean sepulchres outside the Argolid, from which, and from the continuation of Tsountas's exploration of the buildings and lesser graves at Mycenae, a large treasure, independent of Schliemann's princely gift, has been gathered into the National museum at Athens.

Between this date and the end of the century many isolated tombs of the beehive type and cemeteries of rectangular rock-cut chamber tombs were explored in different districts of Greece. Chamber tombs were found in Attica, at Spata, Markopoulo and Alyke, and in Argolis at Nauplia, and near the Argive Heraeum, and some late graves in Salamis. Beehive tombs, already rifled, but retaining some of their furniture, were excavated at Dimeni in Thessaly, Menidi and Thoricus in Attica, Orchomenus in Boeotia, and Kampos in Laconia. The richest tomb of all was cleared at Vaphio in Laconia in 1889, and this produced, in addition to a fine series of engraved gems and miscellaneous goldsmith's work, two splendid golden cups chased with scenes of bull hunting, and fragments of large vases painted in a bold florid style. These latter, with similar fragments from the Argive Heraeum, Thoricus, and Mycenae itself, remained an enigma till the excavation of Cnossus revealed the "Palace" style. The exploration of famous classical sites showed too that many of these, with the notable exception of Olympia, had been important centres of culture in Aegean times. Thus the sanctuary at Delphi, the Heraeum by Argos and the Acropolis of Athens all yielded their quota of what were still called Mycenaean objects and the last site boasts a fortification wall similar in style to those of Mycenae and Tiryns with column bases and foundations of a "palace." A Cyclopean acropolis and "palace" were explored on the island of Goulas in Lake Copais, the prehistoric dykes of which were now surveyed. Mycenaean remains came to light in most parts of Greece, but except for Eleusis, Aegina and Thoricus, where little was done, no inhabited sites were touched. At these last three sites pottery of new types was found which we now know to be pre-Mycenaean; but this and the discovery by Wide in 1894 in a barrow at Aphidna of burials containing similar wares remained almost unnoticed. Similarly some early rock-cut tombs with peculiar hand-made pottery found in the American excavations at Corinth in 1896 did not fall into their right context till the discoveries at Korakou, near Corinth, almost 20 years later.

**Excavation Outside Greece.**—Meanwhile prehistoric research had begun to extend beyond the Greek mainland. Certain central Aegean islands, Antiparos, Ios, Amorgos, Syros and Siphnos, were all found to be singularly rich in evidence of the early Aegean period. The series of Syran-built graves, containing crouching corpses, is the most representative known in the Aegean. Exceptionally rich cemeteries of the same date have been explored in Naxos, and Paros has yielded in addition to early graves some remains of the middle period. Delos too has proved an unexpected source of early Aegean culture. Melos, long marked as a source of early objects, but not systematically excavated till taken in hand by the British school at Athens in 1896, yielded at Phylacope remains of all the Aegean periods, except the Neolithic. Numerous cemeteries with late Aegean pottery have been found in Rhodes. A map of Cyprus in the later Bronze Age (such as is given by J. L. Myres and M. O. Richter in *Catalogue of the Cyprus Museum*) shows more than 25 settlements in and about the Mesaorea district alone, of which one, that at Enkomi, near the site of Salamis, has yielded the richest Aegean treasure in precious metal found outside Argolis E Gjerstad (*Studies on Prehistoric Cyprus*) has since added to the number of prehistoric sites in the island, the relationship of which to the general Aegean culture is gradually becoming clearer. In Asia Minor a cemetery at Yortan in Mysia and Korte's excavations at Gordium in Phrygia have yielded pottery similar to that from the early strata of Hissarlik Exploration of south-western Asia Minor has also brought to light remains of the prehistoric age; but though pottery of late Aegean style is found along the coast and ceramic specimens of Aegean appearance have often been brought back from many districts of Anatolia, the connections of Asia Minor and of Hissarlik (Troy) still seem, so far as the early and middle Aegean periods are concerned, to lie outside the Aegean area proper (*see* TROY). In Egypt in 1887 W. M. F. Petrie found painted sherds of Cretan style at Kahun in the Fayum, and farther up the Nile, at Tell el-Amarna, chanced on bits of no fewer than 800 Aegean vases in 1889. Much material from subsequent excavations has accumulated to demonstrate that Egypt and the Aegean were in contact from early dynastic times. There have now been recognized in the collections at Cairo, Florence, London, Paris and Bologna several Egyptian imitations of the Aegean style which can be set off against the many debts which the centres of Aegean culture owed to Egypt. Two Aegean vases were found at Sidon in 1885, and many fragments of Aegean and especially Cypriote pottery have been turned up during recent excavations of sites in Philistia and Palestine. Indeed the typical Philistine pottery is derived from the latest Aegean fabric. South-eastern Sicily, ever since P. Orsi excavated the Sicel cemetery near Lentini in 1877, has proved a mine of early remains, among which appear in regular succession Aegean decorative motives from the period of the second stratum at Hissarlik. Vases of the last Aegean period have also been found. Aegean objects too have been reported from Sardinia, although the Aegean influence formerly thought to have been observed in Spain, is now discredited or at least considered much overrated.

One land, however, has eclipsed all others in the Aegean by the wealth of its remains of all the prehistoric ages; viz., Crete, so much so that, for the present, we must regard it as the fountain-head of Aegean civilization, and probably for long its political and social centre. The island first attracted the notice of archaeologists by the remarkable archaic Greek bronzes found in a cave on Mt. Ida in 1885, as well as by epigraphic monuments such as the famous law of Gortyna; but the first undoubted Aegean remains reported from it were a few objects extracted from Cnossus by Minos Kalokairinos of Candia in 1878. These were followed by important discoveries made in the southern plain (Messará) by F. Halbherr. W. J. Stillman and H. Schliemann both made unsuccessful attempts at Cnossus, and A. J. Evans, coming on the scene in 1893, travelled in succeeding years about the island picking up trifles of unconsidered evidence, which gradually convinced him that greater things would eventually be found. He obtained enough to enable him to forecast the discovery of written characters, till then not suspected in Aegean civilization. The revolution of 1897–98 opened the door to wider knowledge, and much exploration has ensued, for which *see* CRETE.

**Further Mycenaean Investigations.**—The success of the excavations in Crete naturally caused fresh attention to be paid to Mycenaean remains on the mainland. At Thebes the ruins of the "House of Cadmus" were found by Keramopoullos and yielded many fragments of brilliant frescoes and a store of inscribed vases of the latest period; while close to the city, chamber tombs, stored with vases and other funeral furniture, were excavated. At Orchomenos the Mycenaean stratum was explored by Furtwängler and the underlying strata, which reach down to the neolithic deposits, began to reveal for the first time the pre-Mycenaean history of the mainland. Wares of the early and middle Aegean periods were unearthed at Aegina and the later continuance of the work there has much enlarged our knowledge and shown that the town was protected by a wall. Imported Cretan ware of the middle period has also come to light. At Tiryns many fragments of frescoes from the palace were found, and in the strata beneath the palace floor, reaching down to bed rock,

remains of the middle and early periods appeared Further beehive tombs were excavated at Kakovatos at the Messenian Pylos and at Tiryns, but the last had unfortunately been completely plundered at least by Roman times. More evidence for the last period came in from Argos, where the middle period also appeared, Achaea, Aetolia, Locris, and Cephalonia showing that culture all over Greece in the late bronze age had been more or less uniform.

Meanwhile in Thessaly discoveries were being made which were to give a new aspect to the pre-history of Greece. Here rich deposits of painted neolithic pottery were found at Dimini and Seskio by Tsountas, who cleared some small beehive tombs of the transitional period between the bronze and iron ages at Marmariane. Further systematic excavation of other sites in Thessaly by British archaeologists and researches by Soteriades in Boeotia and Phocis showed that the neolithic pottery of the Greek mainland was totally different from that of Crete and therefore that the underlying basis for the bronze age in these two main spheres of Aegean culture was by no means the same. This was supported by the results obtained by Dörpfeld in Leucas, where he found wares of all three periods (early, middle and late) and neolithic pottery with painted decoration closely akin to the Thessalian. Euboea produced tombs of the early bronze age, showing a [illegible] both to the wares of the Cyclades and to those of [illegible] and more tombs of the late period which indicate that the results obtained in this island coincide with those from elsewhere. Even before the war the American excavators had obtained hints that Corinth was likely to prove fertile in pre-historic remains, but not till 1915 was any great success won. Since that year the Americans under the leadership mainly of Blegen and Miss Walker have rewritten the early history of the mainland. A series of discoveries and excavations has shown that neolithic wares similar to those of Thessaly are to be found in the Peloponnese, where Corinth, Nemea, the Argive Heraeum and Arcadia have all yielded relics of this period. Further, largely as the result of the excavation of Korakou, a prehistoric port on the Gulf of Corinth near Lechaeum, supported by fruitful work at Zygouries (near Cleonae), Nemea and the Argive Heraeum, it has been possible to obtain a clear view of the three stages of the bronze age on the mainland.

**The Aegean Area.**—Traces of the early and middle bronze ages have also appeared in Laconia, and the German work at Amyclae has yielded many relics of the late period. At Asine, near Nauplia, a Swedish expedition under Persson has achieved brilliant results and recovered remains of all three periods. The same expedition at Dendra, near Midea, has excavated an unplundered beehive tomb which shows the burial ritual and found treasures richer than those of Vaphio. There is a splendid gold cup chased with a design of octopuses and dolphins, a gold and silver cup adorned with bulls' heads, silver cups, weapons of bronze, engraved sealstones of wondrous size, and pottery which dates the tomb to about 1350 B.C., the last period. Nearby is a chamber tomb, with a hoard of 33 bronze vessels, which, though empty of human remains, seems to have been a cenotaph and throws much light on the cult of the dead. At Mycenae the British work directed by Wace has found remains of all three periods of the bronze age, including a rich series of tombs of the last period, and established the history of the shaft graves found by Schliemann. The palace has been re-explored and, with the Lion Gate and walls, been found to date from the latter part of the last period, from 1400 B.C. The beehive tombs, also re-examined, can be dated with some degree of probability, and the finest, such as the Treasury of Atreus are seen to be contemporary with the Lion Gate. These results are confirmed by the renewed work of the Germans at Tiryns under Karo and Kurt Müller, who find that the palace and the walls, with three stages at least, are approximately contemporary with those of Mycenae. The Swedish finds at Dendra and in the beehive tombs of Bodia, in Messenia, agree with these conclusions, which all tend to show that after the fall of Cnossus, about 1400 B.C., Mycenae as the chief stronghold of the mainland succeeded to the Aegean empire and spread Aegean culture far and wide.

Further work in Boeotia at Eutresis and other sites has extended our knowledge of the houses and culture of the two first periods, and on the Acropolis of Athens itself neolithic pottery of the Thessalian type has come to light as well as pottery of the early bronze age. The latest revelation comes from Samos, where bronze age pottery of the middle and late periods, it is said, has been discovered. Thus on the one hand new discoveries have emphasized the uniform and widespread character of the Aegean culture throughout the area, and on the other hand the latest finds on the mainland indicate considerable divergence between it and Crete. The last point is of vital importance in considering the historical and ethnological problems of Greece in the Aegean or prehistoric age. The "Aegean Area" now covers the Archipelago with Crete and Cyprus, the Hellenic peninsula with the Ionian isles, and western Anatolia. Evidence is also coming in from the Macedonian coast Offshoots are found in the western Mediterranean, in Sicily, Italy, Sardinia, and in the East in Palestine and Egypt. About the Cyrenaica we are still insufficiently informed.

## II. GENERAL NATURE OF THE EVIDENCE

For details of monumental evidence the articles on CRETE, MYCENAE, TIRYNS, TROY, CYPRUS, etc., must be consulted. The most representative site explored up to now is Cnossus, which has yielded the most various and the most continuous evidence from the Neolithic age to the twilight of classical civilization. Next in importance are in Crete, Phaestus, Agia Triada, Mochlos, Vasilike, Tylissus, Gournia, Mallia and the tombs of Mesara; on the mainland, after Mycenae, Tiryns, Thebes, Asine, Korakou and the other sites already mentioned, are Agia Marina, Lianokladi and Tsangli; in the islands, Phylacope in Melos, and on the Anatolian littoral Hissarlik (Troy).

A. The *internal* evidence at present available comprises:—

(1) *Structures.*—Ruins of palaces, palatial villas, houses, built dome- or cist-graves and fortifications (Aegean isles, Greek mainland and north-west Anatolia), but not distinct temples; small shrines, however, and *temenê* (religious enclosures, remains of one of which were probably found at Petsofa, near Palaikastro, by J. L. Myres in 1904) are represented on intaglios and frescoes. From like sources and from inlay-work we have also representations of palaces and houses.

(2) *Structural Dècoration.*—Architectural features, such as columns, friezes and various mouldings; mural decoration, such as fresco-paintings, coloured reliefs and mosaic inlay.

(3) *Furniture.*—(*a*) *Domestic,* such as vessels of all sorts and in many materials, from huge store-jars down to tiny unguent pots; culinary and other implements; thrones, seats, tables, etc , these all in stone or plastered terra-cotta; (*b*) *Sacred,* such as models or actual examples of ritual objects; of these we have also numerous pictorial representations; (*c*) *Funerary; e.g.,* coffins in painted terra-cotta

(4) *Artistic Fabrics, e.g.,* plastic objects, carved in stone or ivory, cast or beaten in metals (gold, silver, copper and bronze), or modelled in clay, faience, paste, etc. No trace has yet been found of large free sculpture, but many examples exist of sculptors' smaller work. Vases of all kinds, carved in marble or other stones, cast or beaten in metals or fashioned in clay, the latter in enormous number and variety, richly ornamented with coloured schemes, and sometimes bearing moulded decoration. Examples of painting on stone, opaque and transparent. Engraved objects in great number; *e g.,* ring-bezels and gems; and an immense quantity of clay impressions, taken from these.

(5) *Weapons, tools and implements,* in stone, clay and bronze, and at the last iron, sometimes richly ornamented or inlaid. Numerous representations also of the same. No actual body-armour, except such as was ceremonial and buried with the dead, like the gold breastplates in the circle-graves at Mycenae.

(6) *Articles of personal use, e.g.,* brooches (*fibulae*), pins, razors, tweezers, etc., often found as dedications to a deity; *e.g.,* in the Dictaean cavern of Crete. No textiles have survived.

(7) *Written documents; e.g.,* clay tablets and discs (so far in Crete only), but nothing of more perishable nature, such as skin, papyrus, etc.; engraved gems and gem impressions; legends writ-

ten with pigment on pottery (rare); characters incised on stone or pottery. These show two main systems of script (*see* CRETE).

(8) *Excavated tombs*, of either the pit or the grotto kind, in which the dead were laid, together with various objects of use and luxury, without cremation, and in either coffins or *loculi* or simple wrappings.

(9) *Public works*, such as paved and stepped roadways, bridges, systems of drainage, etc.

B. There is also a certain amount of *external* evidence to be gathered from:—

(1) Monuments and records of other contemporary civilizations; *e.g.*, representations of alien peoples in Egyptian frescoes; imitation of Aegean fabrics and style in non-Aegean lands; allusions to Mediterranean peoples in Egyptian, Hittite, Semitic or Babylonian records.

(2) Literary traditions of subsequent civilizations, especially the Hellenic, such as, *e g.*, those embodied in the Homeric poems, the legends concerning Crete, Mycenae, etc.; statements as to the origin of gods, cults and so forth, transmitted to us by Hellenic antiquarians such as Strabo, Pausanias, Diodorus, Siculus, etc.

(3) Traces of customs, creeds, rituals, etc., in the Aegean area at a later time, discordant with the civilization in which they were practised and indicating survival from earlier systems. There are also possible linguistic and even physical survivals to be considered.

### III. GENERAL FEATURES OF AEGEAN CIVILIZATION

The leading features of Aegean civilization, as deduced from the evidence must be stated very briefly.

(1) **Political Organization.**—The great Cretan palaces and the fortified citadels of Mycenae, Tiryns and Hissarlik, each containing little more than one great residence, and dominating lower towns of meaner houses, point to monarchy at all periods. Independent local developments of art before the middle of the 2nd millennium B.C. suggest the early existence of independent units in various parts, of which the strongest was the Cnossian. After that date the evidence goes strongly to show that one political dominion was spread for a brief period, or for two brief periods, over almost all the area (*see* later). The great number of tribute tallies found at Cnossus perhaps indicates that the centre of power was there for some time.

(2) **Religion.**—The fact that shrines have so far been found within palaces and not certainly anywhere else indicates that the kings kept religious power in their own hands; perhaps they were themselves high-priests. Religion in the area seems to have been essentially the same everywhere from the earliest period; viz., the cult of divine principles, resident in dominant features of nature (sun, stars, mountains, trees, etc.) and controlling fertility. This cult passed through an aniconic stage, from which fetishes survived to the last, these being rocks or pillars, trees, weapons (*e.g.*, *bipennis*, or double war-axe, shield), etc. When the iconic stage was reached, about 2000 B.C., we find one divine spirit represented as a goddess with a subordinate young god, as in many other eastern Mediterranean lands. The god was probably son and mate of the goddess, and the divine pair represented the genius of reproductive fertility in its relations with humanity. The goddess at times appears, with doves, as uranic, at others with snakes, as chthonic. In the ritual fetishes, often of miniature form, played a great part: all sorts of plants and animals were sacred; sacrifice (not burnt, and human very doubtful), dedication of all sorts of offerings and *simulacra* invocation, etc., were practised. The dead were objects of a sort of hero-worship especially on the mainland. This early nature-cult, explains many anomalous features of Hellenic religion, especially in the cults of Artemis and Aphrodite (*see* CRETE).

(3) **Social Organization.**—There is a possibility that features of a primeval matriarchate long survived; but there is no certain evidence. Of the organization of the people under the monarch we are ignorant. There are so few representations of armed men that it seems doubtful if there can have been any professional military class. Theatral structures found at Cnossus and Phaestus, within the precincts of the palaces, were perhaps used for shows or for sittings of a royal assize, rather than for popular assemblies. The Cnossian remains contain evidence of an elaborate system of registration, account-keeping and other secretarial work, which perhaps indicates a considerable body of law. The life of the ruling class was comfortable and even luxurious from early times. Fine stone palaces, richly decorated, with separate sleeping apartments, large halls, ingenious devices for admitting light and air, sanitary conveniences and marvellously modern arrangements, for supply of water and for drainage, attest this fact. Even the smaller houses, after the Neolithic period, seem also to have been of stone, plastered within. After 1600 B.C. the palaces in Crete had more than one storey, fine stairways, bath-chambers, windows, folding and sliding doors, etc. In this later period, the distinctions of blocks of apartments in some palaces has been held to indicate the seclusion of women in *harems*, at least among the ruling caste. Cnossian frescoes show women grouped apart, and they appear alone on gems. Flesh and fish and many kinds of vegetables were evidently eaten, and wine and beer were drunk. Vessels for culinary, table and luxurious uses show an infinite variety of form and purpose. Artificers' implements of many kinds were in use, bronze succeeding obsidian and other hard stones as the material. Seats are found carefully shaped to the human person. There was evidently olive- and vine-culture on a large scale. Chariots were in use in the later period, as is proved by the pictures of them on Cretan tablets and at Mycenae, Tiryns and Vaphio, and therefore the horse was known. Main ways were paved. Sports, probably more or less religious, are often represented; *e.g.*, bull-fighting, dancing, boxing and armed combats.

(4) **Commerce** was practised to some extent in very early times, as is proved by the distribution of Melian obsidian over most of the Aegean area and by the Nilotic influence on early Minoan art. We find Cretan vessels exported to Melos, Egypt and the Greek mainland. Melian vases came in their turn to Crete After 1600 B.C. there is very close intercourse with Egypt, and Aegean things find their way to all coasts of the Mediterranean (*see* below). No traces of currency have come to light, unless certain axe-heads too slight for practical use, had that character; but standard weights have been found, and representations of ingots. The Aegean written documents have not yet proved (by being found outside the area) epistolary correspondence with other lands. Representations of ships are not common, but several have been observed on Aegean gems, [illegible] and vases. There are also leaden and clay models of [illegible] are vessels of low free-board, with masts. Familiarity with the sea is proved by the free use of marine motives in decoration.

(5) **Treatment of the Dead.**—The dead in the earlier period were laid (so far as we know at present) within cists constructed of upright stones. These were sometimes inside caves and occasionally clay coffins were used. After the burial the cist was covered in with earth. A little later, in Crete, bone pits seem to have come into use, containing the remains of many burials. Possibly the flesh was boiled off the bones at once ("scarification"), or left to rot in separate cists awhile; afterwards the skeletons were collected and the cists re-used. The royal shaft graves at Mycenae are an elaboration of the simple cist grave and the circle surrounding them finds a parallel in the grave rings at Leucas. Chamber tombs built in the early period occur in Crete and rock-cut tombs of the same general type approached by a horizontal or slightly inclined way with the sides converging above are very common on the mainland and in Rhodes in the last period, and are often found in Crete where small clay coffins containing skeletons in a crouching posture are usual. Circular ossuaries which some believe to have been roofed with vaults, occur in Crete in the early period and last into the beginning of the middle period; but the great beehive tombs of Mycenae and the mainland belong to the last period (from about 1500 B.C. onwards) and the finest, such as the treasury of Atreus, to the concluding phase of the bronze age after the fall of Crete about 1400 B.C. Sometimes in Crete at the end of the middle period the dead were trussed up and thrust head foremost into

large jars for burial. On the mainland at a slightly earlier date children are found buried in jars, and sometimes in place of stone cists the dead were surrounded by walls of crude brick or covered with fragments of large store jars. At no period do the Aegean dead seem to have been burned. Weapons, food, water, unguents and various trinkets were laid with the corpse at all periods In the Mycenae circle an altar seems to have been erected over the graves, and on the mainland at least there are definite traces of the worship of the dead A painted sarcophagus, found at Hagia Triada, also possibly shows a hero-cult of the dead.

(6) **Artistic Production.**—Ceramic art reached a specially high standard in fabric, form and decoration by the middle of the 3rd millennium B.C in Crete. The products of that period compare favourably with any potters' work in the world. The same may be said of fresco-painting and probably of metal work. Modelling in terra-cotta, stone and ivory, engraving on gems, were following it closely by the beginning of the 2nd millennium. After 2000 B C. all these arts revived, and sculpture, as evidenced by relief work, both on a large and on a small scale, carved stone vessels, metallurgy in gold, silver and bronze, advanced farther. This art and those of fresco- and vase-painting and of gem engraving stood higher about the 15th century B.C. than at any subsequent period before the 6th century. The manufacture, modelling and painting of faience objects, and the making of inlays in many materials were also familiar to Aegean craftsmen, who show in all their best work a strong sense of natural form and an appreciation of ideal balance and decorative effect, such as are seen in the best products of later Hellenic art. Architectural ornament was also highly developed The richness of the Aegean capitals and columns may be judged by those from the "Treasury of Atreus" now set up in the British Museum; and of the friezes we have examples in Mycenaean and Cnossian fragments, and Cnossian paintings. The magnificent gold work of the later period, preserved to us at Mycenae, Dendra and Vaphio, needs only to be mentioned. It should be compared with stone work in Crete, especially the steatite vases with reliefs found at Hagia Triada. On the whole, Aegean art, at its two great periods, in the middle of the 3rd and 2nd millennia respectively, will bear comparison with any contemporary arts.

## IV. ORIGIN, NATURE AND HISTORY OF AEGEAN CIVILIZATION

The evidence, summarized above, though very various and voluminous, is not yet sufficient to answer all the questions which may be asked as to the origin, nature and history of this civilization, or to answer any but a few questions with absolute certainty.

A. **Distinctive Features.**—The fact that Aegean civilization is distinguished from all others, prior or contemporary, not only by its geographical area, but by leading organic characteristics, has never been in doubt since its remains came to be studied seriously and impartially. The truth was indeed obscured for a time by persistent prejudices in favour of certain alien Mediterranean races long known to have been in relation with the Aegean area in prehistoric times; *e.g.*, the Egyptians and especially the Phoenicians. Others put forward "Achaeans" from the north as its authors. But such claims to the authorship of the Aegean remains grew fainter with every fresh Aegean discovery and every new light thrown on their own proper products; with the Cretan revelations they ceased altogether to be considered except by a few Homeric enthusiasts. Briefly, we now know that the Aegean civilization developed these distinctive features: (1) An *indigenous script* expressed in characters of which only a very small percentage are identical, or even obviously connected, with those of any other scripts. This is equally true both of the pictographic and the linear Aegean systems. Its nearest affinities are with the "Asianic" scripts, preserved to us by Hittite, Cypriote and south-west Anatolian (Pamphylian, Lycian and Carian) inscriptions. But neither are these affinities close enough to be of any practical aid in deciphering Aegean characters, nor is it by any means certain that there is parentage. The Aegean script may be, and probably is, prior in origin to the "Asianic"; and it may equally well be owed to a remote common ancestor, or (the small number of common characters being considered) be an entirely independent evolution from representations of natural objects (*see* CRETE). (2) An *Art*, whose products cannot be confounded with those of any other known art by a trained eye. Its obligations to other contemporary arts are many and obvious, especially in its later stages; but every borrowed form and motive undergoes an essential modification at the hands of the Aegean craftsman, and the product is stamped with a new character. The secret of this character lies evidently in a constant attempt to express an ideal in forms more and more closely approaching to realities. We detect the dawn of that spirit which afterwards animated Hellenic art. The fresco-paintings, ceramic motives, reliefs, free sculpture and toreutic handiwork of Crete have supplied the clearest proof of it, confirming the impression already created by the goldsmiths' and painters' work of the Greek mainland (Mycenae, Thebes, Vaphio, Dendra, Tiryns). (3) *Architectural plans and decoration.* The arrangement of Aegean palaces is of two main types. First (and perhaps earliest in time), the chambers are grouped round a central court, being engaged one with the other in a labyrinthine complexity, and the greater oblongs are entered from a long side and divided longitudinally by pillars. Second, the main chamber is of what is known as the *megaron* type; *i.e.*, it stands free, isolated from the rest of the plan by corridors, is entered from a vestibule on a short side, and has a central hearth, surrounded by pillars and perhaps hypaethral; there is no central court, and other apartments form distinct blocks In spite of many comparisons made with Egyptian, Babylonian and "Hittite" plans, both these arrangements remain incongruous with any remains of prior or contemporary structures elsewhere. Whether either plan suits the "Homeric" palace does not affect the present question. (4) A *type of tomb*, the dome or "beehive," of which the grandest examples known are at Mycenae. The Cretan "larnax" coffins, also, have no parallels outside the Aegean. There are other infinite singularities of detail; but the above are more than sufficient to establish the point.

B. **Origin and Continuity.**—With the immense expansion of the evidence, due to the Cretan excavations, a question arises how far the Aegean civilization, whose total duration covers at least 3,000 years, can be regarded as one and continuous. The exploration of Cnossus shows that Aegean civilization had its roots in a primitive Neolithic period, of uncertain but very long duration, represented by a stratum which (on that site in particular) is in places nearly 20ft thick, and contains stone implements and sherds of hand-made and hand-polished vessels, showing a progressive development in technique from bottom to top. This Cnossian stratum seems to be throughout earlier than the lowest layer at Hissarlik. It closes with the introduction of incised, white-filled decoration on pottery, whose motives are presently found reproduced in monochrome pigment. We are now in the beginning of the bronze age, and the first of Evans's "Minoan" periods. Thereafter, by exact observation of stratification, eight more periods have been distinguished at Cnossus, each marked by some important development in the universal and necessary products of the potter's art, the least destructible and therefore most generally used archaeological criterion. These periods fill the whole bronze age, with whose close, by the introduction of the superior metal, iron, the Aegean age is conventionally held to end. Iron came into general Aegean use about 1000 B.C., and possibly was the means by which a body of northern invaders established their power on the ruins of the earlier dominion. The important point is this, that throughout the nine Cnossian periods, following the Neolithic age (named by Evans, "Minoan I. 1, 2, 3; II. 1, 2, 3; III. 1, 2, 3"; *see* CRETE), there is evidence of a perfectly orderly and continuous evolution in, at any rate, ceramic art. From one stage to another, fabrics, forms and motives of decoration develop gradually; so that, at the close of a span of more than 2,000 years, at the least, influences of the beginning can still be clearly seen and no trace of violent artistic intrusion can be detected. This fact, by itself, would go far to prove that the civilization continued fundamentally and essentially the same throughout. It is, moreover, supported by less abundant remains

of other arts. That of painting in fresco, for instance, shows the same orderly development from at any rate Period II. 2 to the end. About institutions we have less certain knowledge, there being but little evidence for the earlier periods; but in the documents relating to religion, the most significant of all, there is no trace of sharp change. We see evidence of a uniform nature worship passing through all the normal stages down to theoanthropism in the latest period. There is no appearance of intrusive deities or cult-ideas. We may take it then (and the fact is not disputed even by those who believe in one thorough racial change, at least, during the bronze age) that the Aegean civilization was indigenous, firmly rooted and strong enough to remain dominant in its own geographical area throughout the bronze age.

This conclusion does not necessarily lead to the corollary that the mass of those who possessed this civilization remained for the most part racially the same throughout the bronze age. This indeed may be true for Crete, but as already indicated there are grave reasons for believing that on the mainland matters were not so simple, and herein lies the crux of Greek ethnology. A solution which would satisfy the archaeological and anthropological problems to be indicated would go far to solving the vexed questions of Hellenic origins, especially as regards Achaeans and Dorians (*see* DORIANS, ACHAEANS and IONIANS), and the first appearance of Aryans in the peninsula. In the neolithic age the general characteristics of the culture of the mainland and of Crete are quite distinct. On the mainland at the end of the neolithic age a bronze-using culture appears which is undoubtedly akin to that of the islands and Crete. In the middle period, however, about 2000 B.C., a new element comes into the mainland typified for archaeologists by a well marked class of pottery called "Minyan Ware." This occurs as an import into Melos and was even imitated there, but though contemporary Melian wares are recognized in Crete, as in the temple repositories at Cnossus, hardly a sherd of Minyan ware has been found in Crete. Suddenly, just before the beginning of the last period, Cretan influence and culture came in full force to the mainland. Some hold that this betokens a complete conquest of the mainland by Crete, wholesale displacements of population and the institution of Cretan dynasts at Mycenae and elsewhere. Others maintain that this indicates a rapid absorption by a vigorous and progressive folk of a developed culture which they adapted to their own purposes. For the latter view we can urge:—

(1) Distinct differences are observed between the products of the mainland and those of Crete and both, for instance, appear as imports in Melos side by side; (2) the oldest royal grave at Mycenae contains mostly mainland pottery, and throughout the succeeding period, though the superficial culture is Cretan, there are clear signs that its basis is the old element which produced Minyan ware; (3) there is a variation in burial customs between Crete and the mainland pointing to a divergence in belief as regards the dead; (4) the fortified castles of the mainland like Mycenae, Tiryns and Midea are in strong contrast to the undefended palaces of Crete; (5) in the earlier periods Cretan pottery, except in a few cases, has not been found outside, but the adoption of the Cretan phase of Aegean culture by the mainland just precedes the spread of the last phase of that culture far and wide in the Levant, and it is notorious that the remains from Rhodes, Cyprus and Philistia depend on the mainland and not on Crete.

All this suggests that about 1600 B.C. when the last period began some powerful folk (that which introduced Minyan pottery) arose on the mainland and quickly absorbed the mature Aegean culture of Crete, and soon after, when Crete collapsed, about 1400 B.C., the mainlanders became the dominant force and spread their version of Aegean culture abroad. The recent discoveries that the walls and palaces of Tiryns and Mycenae belong to the last phase after 1400 B.C. support this view, as also the other conclusion which places the greatest achievements of Aegean architecture, like the treasury of Atreus, in this the culminating phase of the Aegean culture, which closed perhaps with the great armada led against Troy.

A good deal of anthropometric investigation has been devoted to human remains of the Aegean epoch, especially to skulls and bones found in Crete in tombs of Period II. The result of this, however, has established the fact that the Aegean races, as a whole, belonged to the dark, long-headed *Homo Mediterraneus*—a fact only valuable in the present connection in so far as it tends to discredit an Asiatic source for Aegean civilization, though there was clearly much affinity between Crete and south-western Asia Minor. From the skull-forms studied, it would appear, that the Aegean race was by no means pure even in the earlier Minoan periods. On the mainland indeed the skulls from Asine show that both the long and the short types were present in the middle period together with one or two examples of an "Armenoid" character. This is by no means in disagreement with archaeology. There is some ground for supposing that the language spoken in Crete before the later Doric was non-Hellenic, though perhaps Indo-European. This inference rests on three inscriptions in Greek characters but non-Greek language found in eastern Crete. The language has some apparent affinities with Phrygian. The inscriptions are post-Aegean by many centuries, but they occur in the part of the island known to Homer as that inhabited by the Eteo-Cretans, or aborigines. Their language may prove to be that of the Linear tablets.

## V. HISTORY OF AEGEAN CIVILIZATION

History of an inferential and summary sort only can be derived from monuments in the absence of written records. The latter do, indeed, exist in the case of the Cretan civilization and in great numbers; but they are undeciphered and likely to remain so, except in the improbable event of the discovery of a long bilingual text, partly couched in some familiar script and language. Even in that event, the information which would be derived from the Cnossian tablets would probably make but a small addition to history, since in very large part they are evidently mere inventories of tribute and stores. The engraved gems probably record divine or human names (*see* CRETE).

(1) **Chronology.**—The first chronological datum is inferred from a close similarity between certain Cretan hand-made and polished vases of Minoan Period I. 1. and others discovered by Petrie at Abydos in Egypt and referred by him to the 1st dynasty. He goes so far as to pronounce the latter to be Cretan importations, their fabric and forms being unlike anything Nilotic. If that be so, the period at which stone implements were beginning to be superseded by bronze in Crete must be dated before 4000 B.C. But below all Evans's "Minoan" strata lies the immensely thick Neolithic deposit. To date the beginning of this earliest record of human production is impossible at present. The Neolithic stratum varies very much in depth, ranging from nearly 20ft. to 3ft., but is deepest on the highest part of the hillock. Its variations may be due equally to natural denudation of a stratum once of uniform depth, or to the artificial heaping up of a mound by later builders. Even were certainty as to these alternatives attained, we could only guess at the average rate of accumulation, which proceeds very differently on different sites and under different social and climatic conditions. In later periods at Cnossus accumulation seems to have proceeded at a rate of, roughly, 3ft. per 1,000 years. Reckoning by that standard we might push the earliest Neolithic remains back behind 10,000 B.C.; but the calculation would be worthy of little credence. Surer chronological links are provided by the close affinity with early dynastic Egyptian products shown by the stone bowls from tombs of the 1st period at Mochlos and in Mesara. At Cnossus actual Egyptian bowls of the earliest dynastic times have been found. These facts, and the parallelism displayed by Cretan seals in ivory and stone from the Mesara ossuaries and by Egyptian seals of the 1st six dynasties, enable us to say that the 1st period began before the middle of the 4th millennium. We reach another fairly certain date in the synchronism of remains belonging to the 12th dynasty (*c.* 2225 B.C.) with products of Minoan Period II. 2. Characteristic Cretan pottery of this period was found by Petrie in the Fayum and by Garstang at Abydos in conjunction with 12th dynasty remains, and various Cretan products of the period show striking coincidences with 12th dynasty styles, especially

in their adoption of spiraliform ornament The spiral, however, occurs so often in natural objects (*e g*, horns, climbing plants, shavings of wood or metal) that too much stress must not be laid on the mutual parentage of spiraliform ornament in different civilizations. A diorite statuette, referable by its style and inscription to Dynasty 13, was discovered in deposit of Period II. 2. in the central court, and a cartouche of the "Shepherd King," Khyan, was also found at Cnossus. He is usually dated about 1633 B.C. This brings us to the next and most certain synchronism, that of Minoan Periods III. 1, 2, with Dynasty 18 (*c.* 1600–1400 B.C.). This coincidence has been observed not only at Cnossus, but previously, in connection with discoveries of scarabs and other Egyptian objects made at Mycenae, Ialysus, Enkomi, etc. In Egypt itself Kefti tributaries, bearing vases of Aegean form, and themselves similar in fashion of dress and arrangement of hair to figures on Cretan frescoes and gems of Period III, are depicted under this and the succeeding dynasties (*e.g.*, Rekhmara tomb at Thebes). Actual vases of late Aegean style have been found with remains of Dynasty 18, especially in the town of Amenophis IV.—Akhenaten—at Tell el-Amarna; while in the Aegean area itself we have abundant evidence of a great wave of Egyptian influence beginning with this same dynasty To this wave were owed in all probability the Nilotic scenes depicted on the Mycenae daggers, on frescoes of Hagia Triada and Cnossus, on pottery of Zakro, on the shell-relief of Phaestus, etc.; and also many forms and fabrics; *e.g.*, certain Cretan coffins, and the faience industry of Cnossus. These serve to date, Periods III. 1–2 in Crete, the shaft-graves in the Mycenae circle, the Vaphio tomb, etc., to the 16th and 15th centuries B C, and Period III 3, the walls and palaces of Mycenae and Tiryns, the majority of the 6th stratum at Hissarlik, the Ialysus burials, the upper stratum at Phylacope, etc., to the century immediately succeeding.

The *terminus ad quem* is less certain—iron does not begin to be used for weapons in the Aegean till after Period III. 3, and then not exclusively. If we fix its introduction about 1100 B.C. and make it coincident with the incursion of northern tribes, remembered by the classical Greeks as the Dorian Invasion, we must allow that this incursion did not altogether stamp out Aegean civilization, at least in the southern part of its area. But it finally destroyed the Cnossian palace and initiated the "Geometric" age, with which, for convenience at any rate, we may close the history of Aegean civilization proper.

(2) **Annals.**—From these and other data the outlines of primitive history in the Aegean may be sketched thus. A people, agreeing in its prevailing skull-forms with the Mediterranean race of north Africa, was settled in the Aegean islands from a remote Neolithic antiquity, but, except in Crete, where insular security was combined with great natural fertility, remained in a savage and unproductive condition until far into the 4th millennium B.C. In Crete, however, it had long been in close contact with Egypt and had developed a certain civilization, and at a period more or less contemporary with Dynasties 11 and 12 (2200–2000 B.C.) the scattered communities of the centre of the island coalesced into a strong monarchical state, whose capital was at Cnossus. There the king, probably also high priest of the prevailing nature cult, built a great stone palace, and received the tribute of feudatories, of whom, probably, the prince of Phaestus, who commanded the Messará plain, was chief. The Cnossian monarch had maritime relations with Egypt, and presently sent his wares all over the southern Aegean (*e.g.*, to Melos in the earlier Second City period of Phylacope). A system of pictographic writing came into use early in this Palace period, but only a few documents, made of durable material, have survived Pictorial art of a purely indigenous character, whether on ceramic material or plaster, made great strides, and from ceramic forms we may legitimately infer also a high skill in metallurgy. The absence of fortifications at Cnossus, Mallia, and Phaestus suggests that at this time Crete was internally peaceful and externally secure. Small settlements in close relation with the capital, were founded in the east of the island to command fertile districts and assist maritime commerce. Gournia and Palaikastro fulfilled both these ends; Zakro must have had mainly a commercial purpose, as the starting point for the African coast. The acme of this dominion was reached about the end of the 3rd millennium B C., and thereafter there ensued a certain, though not very serious, decline. The period may be considered to close with a general disaster which overtook the principal Cretan sites at the end of the 17th century B C. The cause is still to seek; some think it was due to war, others believe that it may have been the result of a terrible earthquake This would have been caused by the explosion of the volcano of Thera which split that island in two and covered the prehistoric remains which belong to the last phase of the middle period with a deep deposit of pumice.

On the mainland the neolithic population, to judge by its brilliantly painted pottery, seems to have been distinct from that of the islands and to have been related rather to the tribes of the Danubian and Carpathian areas, which some regard as the original home of the Aryans. After the close of the first neolithic period in Thessaly a bronze-using folk, closely akin to the inhabitants of the islands, came to the mainland and advancing from the south-east gradually made themselves masters of the peninsula as far north as Othrys When this occurred we cannot say, but as the earliest bronze age ware on the mainland is still somewhat primitive it may have taken place well before the end of the 3rd millennium B C. Once established the bronze age people, together with the remains of the aborigines, developed on a culture parallel to that of the Cyclades, and several prosperous settlements arise as at Tiryns, Mycenae itself, Asine, Nemea, Zygouries and Korakou. If the Cretans and islanders were of non-Hellenic race, the bronze-using incomers may have introduced the non-Hellenic place-names in *-ssos* and *-nthos*. When the second period in Crete had already evolved about the beginning of the 2nd millennium B.C. a new factor entered the mainland. This was accompained by a new kind of pottery, "Minyan Ware," but whence or how it came we do not yet know. This people seems to have coalesced readily with the pre-existing population which, as we know, already contained two racial elements, and this is reflected in the skull types from Asine. At first, though in communication with islands such as Melos and Paros, they seem to have had no contact with Crete till shortly before the end of the 17th century B.C. Then Aegean culture, as represented by the Cretan culture of the renaissance after the disaster, came into the mainland in full force. This may have been due to a conquest of the mainland by Cretans, or to the hospitable reception of refugees from the disaster in Crete, or to raids conducted by chiefs of the mainland against Crete. Whatever the cause the mainland became saturated with Cretan culture, but it still retained its own individuality, which changed and charged with its own feeling whatever was borrowed [illegible] For instance the evolution of certain mainland vase shapes continues unbroken, but is modified by the influence of Crete. Thus at the beginning of the 3rd period, almost coincident with the rise of the 18th dynasty in Egypt, we have a renaissance in Crete and the establishment of strong centres of culture at Mycenae, Thebes and other mainland sites. In Crete the palaces were rebuilt on a larger scale and with more sumptuous appointments, though there was a distinct tendency towards the baroque. The mainland followed suit, but there is almost the same quality of difference between them as there is between English and American 18th century culture. For two centuries this continued, the mainland becoming stronger and Crete weaker, till just about the time when the 18th dynasty decayed in the nerveless hands of Akhenaten, Crete collapsed and ceased to be the centre of Aegean culture. She still existed, but only as a provincial centre, down to the dawn of the iron age. Her inheritance passed to the mainland which, probably under the leadership of Mycenae, established a great dominion, such as that which Homer depicts under Agamemnon's suzerainty. This is the age of the greatest uniformity of the Aegean culture. Then arose the great Cyclopean fortresses of Tiryns and Mycenae with their palaces, then were built the proudest of the beehive tombs, then Aegean products of mainland style reached distant shores from Sicily to Philistia,

from Macedonia to Egypt. The energy of the mainlanders both in spreading abroad through the Mediterranean the culture which they had adopted as their own and in erecting monumental buildings which testify to amazing architectural skill, demonstrates that they were a people of strong character, capable and original. Were these the Achaeans? Who were the makers of Minyan ware? Were they from Asia Minor like the Tantalids; and were they, so to speak, the forerunners of the Etruscans, who in another land at a later date so quickly absorbed Hellenic culture? These are problems which cannot yet be answered, but it seems possible that Aryans may well have been resident in the peninsula long before the Homeric age and so were not northern invaders as modern criticism has asserted, for Greek tradition regarded the Achaeans as natives. The activities of the mainland folk after 1400 seem to find an echo in the Hittite tablets which record the doings of the Ahhiyava from that century onwards.

Towards the beginning of the 12th century the traditional date for the Trojan War and when Egypt was vexed by the Peoples of the Sea, signs of degeneration again appear and soon after came a final catastrophe, probably about 1100 B.C. Mycenae and Tiryns went up in flames. The palace at Cnossus was once more destroyed, and never rebuilt or re-inhabited. Iron took the place of bronze, and Aegean art, as a living thing, ceased on the Greek mainland and in the Aegean isles, including Crete, together with Aegean writing. In Cyprus, and perhaps on the south-west Anatolian coasts, the cataclysm was less complete, and Aegean art continued to languish, cut off from its fountain-head. Such artistic faculty as survived elsewhere issued in the lifeless geometric style which is reminiscent of the later Aegean, but wholly unworthy of it. Cremation took the place of burial of the dead. This great disaster, which cleared the ground for a further evolution of art, was probably due to an incursion of northern tribes, gradual rather than sudden, who were possessed of superior iron weapons—those tribes which later Greek tradition and Homer knew as the Dorians. They crushed a civilization that had outgrown its strength; and it took two or three centuries for the artistic spirit, instinct in the Aegean area, and probably preserved in suspended animation by the survival of Aegean racial elements, to blossom anew. On this conquest seems to have ensued a long period of unrest and popular movements, known to Greek tradition as the Ionian Migration and the Aeolic and Dorian "colonizations"; and when once more we see the Aegean area clearly, it is dominated by Hellenes, though it has by no means lost all memory of its earlier culture, which was after all the mainspring of the Greek genius. The darkness that shrouds the close of the bronze age was but the prelude to a brighter dawn.

**AEGEAN SEA,** an arm of the Mediterranean sea, between Greece on the west and Asia Minor on the east, and connected by the Dardanelles with the sea of Marmora, and the Black sea The name archipelago (*q v*) was formerly applied scientifically to this sea. Various derivations suggest origin of "Aegean" from the town of Aegeae, or from Aegea, queen of the Amazons, who perished in this sea; or from Aegeus, father of Theseus, who drowned himself here. Structurally the sea is a much-shattered old land-block almost entirely submerged, outlined by younger fold-mountains (being continuations of ranges of Asia Minor), also partly submerged. Both features have accounted for this island-studded sea with its alternating deeps and shallows Island chains may be traced through Chios, Psara and Skyros to the North Sporades, through Samos, Nikaria, Mykoni, Tinos, Andros and the south-east promontory of Euboea, and through Rhodes, Scarpanto, Crete and Cerigo to the south-east promontory of the Peloponnese. Between the latter chains are the great group of the Cyclades including Naxos, Paros and Milo. Islands in the northern section of the sea include Thasos, off the Macedonian coast, Samothrace, fronting the Gulf of Saros, and Imbros and Lemnos, in prolongation of the Gallipoli peninsula, while Mitylene lies off the coast of Asia Minor. Important sea basins are those of the Cretan sea with depths of over 1,000 fathoms, and the trough between Thessaly and the gulf of Saros over 600 fathoms Many islands are of volcanic formation; and a well-defined volcanic group includes Milo, Kimolos, Santorin (Thira) and Thirasia. The larger islands have some fertile and well-watered valleys and plains. The chief productions are wheat, wine, oil, mastic, figs, raisins, honey, wax, cotton and silk. The people fish for coral and sponges, as well as for bream and mullet. Greece owns most of the islands, but a number collectively known as the Dodecanese, including Rhodes, Scarpanto, Kaxo, Astypalaea, Kharki, Symi, Tilos, Nisyros, Kos, Kalymnos, Leros and Patmos and minor ones are in Italian hands. Imbros and Tenedos remain Turkish.

**AEGEUS,** son of Pandion and grandson of Cecrops, was king of Athens and the father of Theseus (*q.v.*).

**AEGINA** (*Egina* or *Engia*), a Greek island, in the Saronic gulf, 20m. from the Piraeus. Tradition derives the name from Aegina, the mother of Aeacus, who was born in and ruled the island. In shape Aegina is triangular, 8m. long from north-west to south-east, and 6m. broad, with an area of about 41 sq m The western side consists of stony but fertile plains, well cultivated with grain, vines, almonds, figs and some cotton. The rest of the island is rugged. From the conical Mt. Oros at the south end, the Panhellenian ridge stretches north with narrow fertile valleys on either side. From the absence of marshes the climate is the most healthy in Greece. The island forms part of the modern *nomos* of Attica and Boeotia, of which it forms an *eparchy*. The sponge fisheries are important. The chief town is Aegina, at the north-west end of the island, the favourite summer residence of many Athenians.

**Antiquities.**—The well known temple stands on the ridge near the north corner of the island. In 1811 Baron Haller von Hallerstein and the English architect, C. R. Cockerell, discovered much sculpture from the pediments, which was bought in 1812 by the crown prince Louis of Bavaria and set up in the Glyptothek at Munich. The restoration by B. Thorvaldsen was drastic, ancient parts being cut away to allow of additions treated in imitation of the ancient weathering. The arrangement of the figures has been disputed. Cockerell's inward-facing groups were adopted at Munich till 1901, when Furtwängler's excavation of the site, and fresh

FROM FURTWANGLER, "DAS HEILIGTUM DER APHAIA," BY COURTESY OF THE BAYERISCHE AKADEMIE DER WISSENSCHAFTEN

PLAN OF THE TEMPLE OF APHAEA, IN AEGINA

This temple with its famous sculptures was subjected to violent "restoration" at the beginning of last century, but its true character was established by Herr Furtwängler's researches in 1901. Excavations have also shown that the temple belonged not to Zeus or Athena but to a local goddess Aphaea

study of the figures and fragments in Munich, led to a rearrangement which may be regarded as approaching finality. The figures no longer all face towards the centre, but are broken up, as in other early compositions, into a series of groups of two or three figures each. A figure of Athena still occupies the centre of each pediment, but is set farther forward. On each side of this, in the west pediment, is a group of two combatants over a fallen warrior; in the east pediment, a warrior whose opponent is falling into the arms of a supporting figure; other figures also—the bowmen especially—face towards the angles, and so give more variety. The west pediment, which is more conservative in type, represents the earlier expedition of Heracles and Telamon against Troy; the eastern, which is bolder and more advanced, probably refers to episodes in the Trojan war. There are also remains of a third pediment, which may have been produced in competition, but never placed on the temple (For the character of the sculptures *see* GREEK ART.) Inscriptions found by the recent excavations seem to prove that the shrine belonged not to Zeus or Athena as formerly supposed, but to the local goddess, Aphaea, identified by Pausanias with Britomartis and Dictynna. The present temple probably dates from the time of the Persian wars. In the town of Aegina itself are the remains of another temple, dedicated to Aphrodite; one column of this still remains standing, its foundations are fairly preserved, and its votive offerings are important in the early history of Greek vase painting.

## HISTORY

Aegina, according to Herodotus (v. 83), was a colony of Epidaurus, to which state it was originally subject. The discovery of gold ornaments belonging to the latest period of Mycenaean art suggests the inference that the Mycenaean culture held its own in Aegina for some generations after the Dorian conquest of Argos and Lacedaemon. It is probable that the island was not Dorized before the 9th century B.C. One of the earliest facts known to us in its history is its membership in the League of Calauria, which included, besides Aegina, Athens, the Minyan (Boeotian) Orchomenus, Troezen, Hermione, Nauplia and Prasiae, and was probably an organization for the suppression of piracy. It follows that the maritime importance of the island dates back to pre-Dorian times. Aegina was the first state of European Greece to coin money (*see* PHEIDON). Within 40 years of the invention of coinage by the Lydians (*c.* 700 B.C.), the Aeginetans introduced the system to the western world. The fact that the Aeginetan scale of coins, weights, etc. was in general use in the Greek world is sufficient evidence of the commercial importance of the island. In the earlier half of the 7th century B.C. it appears to have belonged to the Eretrian league. In the next century Aegina is one of the three principal states, and the only state of European Greece trading at the emporium of Naucratis (Herod. ii. 178). At the beginning of the 5th century it seems to have been an entrepôt of the Pontic grain trade, at a later date an Athenian monopoly (Herod. vii. 147). Unlike the other commercial states of the 7th and 6th centuries B.C., Aegina founded no colonies.

THE "HARPY CUP," A FAMOUS EXAMPLE OF AEGINETAN ART. THE ILLUSTRATION SHOWS PART OF THE UPPER DESIGN

The history of Aegina, as it has come down to us, is almost exclusively a history of its relations with Athens. The account which Herodotus (v. 79–80; vi. 49–51, 73, 85–94) gives of the relations between the two states is to the following effect. Thebes, after the defeat by Athens about 507 B.C., appealed to Aegina for assistance. The Aeginetans at first contented themselves with sending the images of the Aeacidae, the tutelary heroes of their island. Subsequently, however, they entered into an alliance, and ravaged the seaboard of Attica. The Athenians were preparing to make reprisals, in spite of the advice of the Delphic oracle that they should desist from attacking Aegina for 30 years, and content themselves meanwhile with dedicating a precinct to Aeacus, when their projects were interrupted by the Spartan intrigues for the restoration of Hippias. In 491 B.C. Aegina was one of the states which gave the symbols of submission ("earth and water") to Persia. Athens at once appealed to Sparta to punish this act of Medism, and Cleomenes I. (*q.v.*), one of the Spartan kings, crossed over to the island, to arrest those who were responsible for it. His attempt was at first unsuccessful; but, after the deposition of Demaratus, he visited the island a second time, accompanied by his new colleague Leotychides, seized ten of the leading citizens and deposited them at Athens as hostages. After the death of Cleomenes and the refusal of the Athenians to restore the hostages to Leotychides, the Aeginetans retaliated by seizing a number of Athenians at a festival at Sunium. Thereupon the Athenians concerted a plot with Nicodromus, the leader of the democratic party in the island, for the betrayal of Aegina. He was to seize the old city, and they were to come to his aid with 70 vessels. The plot failed owing to the late arrival of the Athenian force. An engagement followed in which the Aeginetans were defeated. Subsequently, however, they succeeded in winning a victory over the Athenian fleet. The dates of these incidents are uncertain. It is unlikely that Athens was at war in 498 B.C. as she sent 20 ships to help the Ionians in revolt against Persia, and Herodotus nowhere suggests a peace earlier than 481 B.C. If we may regard the "30 years" of the Delphic oracle as fixed after the event, *i.e.*, after the Athenian victory in 458 B.C. we may assign the dedication of the shrine to Aeacus and the beginning of the war to 488 B.C. This is supported by the building of the great Athenian fleet—"for the war against Aegina"—in 483 B.C. Overtures were unquestionably made by Thebes for an alliance with Aegina, *c.* 507 B.C., but they came to nothing. The refusal of Aegina was veiled under the diplomatic form of "sending the Aeacidae." The real occasion of the outbreak of the war was the refusal of Athens to restore the hostages some 20 years later. There was but one war, and it lasted from 488 to 481 B.C., when it was suspended owing to the invasion of Xerxes. That Athens had the worst of it in this war is certain. Herodotus had no Athenian victories to record after the initial success, and the fact that Themistocles was able to carry his proposal to devote the surplus funds of the state to the building of so large a fleet seems to imply that the Athenians were themselves convinced that a supreme effort was necessary. It may be noted, in confirmation of this view, that the naval supremacy of Aegina is assigned by the ancient writers on chronology to precisely this period, *i.e.*, the years 490–480 B.C. In the repulse of Xerxes it is possible that the Aeginetans played a larger part than is conceded to them by Herodotus The Athenian tradition, which he follows in the main, would naturally seek to obscure their services. The destruction of the Persian fleet appears to have been as much the work of the Aeginetan contingent as of the Athenian. It is difficult to credit the number of the vessels that is assigned to them by Herodotus (30 as against 180 Athenian vessels: *see* GREECE. *History; Bibliography*).

During the next 20 years the philo-laconian policy of Cimon (*q.v.*) secured Aegina, as a member of the Spartan league, from attack. The change in Athenian foreign policy, which was consequent upon the ostracism of Cimon in 461 B.C. led to war, in which the brunt of the fighting fell upon Corinth and Aegina. The latter state was forced to surrender to Athens after a siege, and to accept the position of a subject-ally (*c.* 456 B.C.). The tribute was fixed at 30 talents. By the terms of the Thirty Years' Truce (445 B.C.) Athens covenanted to restore to Aegina her autonomy, but the clause remained a dead letter. In the first winter of the Peloponnesian War (431 B.C.) Athens expelled the Aeginetans, and established a cleruchy in their island. The exiles were settled by Sparta in Thyreatis, on the frontiers of Laconia and Argolis. Even in their new home they were not safe from Athenian rancour. A force landed under Nicias in 424, and put most of them to the sword. At the end of the Peloponnesian War Lysander restored the scattered remnants of the old inhabitants to the island. Its greatness, however, was at an end.

It would be a mistake to attribute the fall of Aegina solely to the development of the Athenian navy. It is probable that the power of Aegina had steadily declined during the 20 years after Salamis, and that it had declined absolutely, as well as relatively to that of Athens. Commerce was the source of Aegina's greatness, and her trade, which appears to have been principally with the Levant, must have suffered seriously from the war with Persia. Her medism in 491 is to be explained by her commercial relations with the Persian Empire. She was forced into patriotism in spite of herself, and the glory won at Salamis was paid for by the loss of her trade and the decay of her marine. The completeness of the ruin of so powerful a state finds an explanation in the economic conditions of the island, the prosperity of which rested upon a basis of slave-labour. It is clear, however, that the number of slaves must have been out of all proportion to that of the free inhabitants In this respect the history of Aegina does but anticipate the history of Greece as a whole.

The constitutional history of Aegina is unusually simple. So long as the island retained its independence the government was an oligarchy There is no trace of the heroic monarchy and no tradition of a *tyrannis* The story of Nicodromus, while it proves the existence of a democratic party, suggests, at the same time, that it could count upon little support.

**Modern.**—Aegina passed with the rest of Greece under the successive dominations of Macedon, the Aetolians, Attalus of Pergamum and Rome In 1537 the island, then a prosperous Venetian colony, was overrun and ruined by the pirate Barbarossa (Khair-ed-Din) One of the last Venetian strongholds in the Levant, it was ceded by the treaty of Passarowitz (1718) to the Turks In 1826–28 the town became for a time the capital of Greece and the centre of a large commercial population which has since diminished considerably.

BIBLIOGRAPHY.—The ancient authorities are Herodotus ii., v., vi., vii. and viii; also Thucydides i. 105, 108, ii 27, iv. 56–7. For a criticism of Herodotus' account of the relations of Athens and Aegina, *see* Wilamowitz, *Aristoteles und Athen*, ii. 280–8, Macan, *Herodotus* iv.–vi; ii. 102–20. *See* also G B. Grundy, *The Great Persian War*, pp. 154 *et seq.*, 202 *et seq*, 373 *et seq.*

**AEGINETA, PAULUS,** a celebrated surgeon of the island of Aegina, whence he derived his name. According to Le Clerc's calculation, he lived in the 4th century of the Christian era; but Abulfaragius (Bar-Hebraeus) places him with more probability in the 7th The title of his most important work is Ἐπιτομῆς Ἰατρικῆς Βιβλία Ἑπτά (*Synopsis of Medicine in Seven Books*); the 6th book, treating of operative surgery, is of interest for surgical history.

The whole work in the original Greek was published at Venice in 1528; another edition appeared at Basle in [illegible] Latin translations have been published, and an English version, with commentary, by F. Adams (1844–48). Edition by Heiberg (Leipzig, 1912) and German trans. with appendix by I. Berendes (Leyden, 1914).

*See* M. Neuberger, *History of Medicine*, vol i (1910).

**AEGIRITE** or **ACMITE:** *see* PYROXENE.

**AEGIS,** in Homer, the shield or buckler of Zeus. It was furnished with tassels and bearing the Gorgon's head in the centre. Originally symbolical of the storm-cloud, it probably signifies rapid, violent motion (Gr. *aïssō*). In the later story Zeus is said to have used the skin of the goat Amaltheia (Gr. *aigis*= goat-skin) as a buckler when he went forth to do battle against the giants; in another legend, it is the skin of a monster slain by Athena, who afterwards wore it as a cuirass. Such skin shields were the original form of body protection, afterwards replaced by the solid shield covered with metal. It appears to have been really the goat's skin used as a belt to support the shield. When so used it would generally be fastened on the right shoulder, and would partially envelop the chest as it passed obliquely round in front and behind to be attached to the shield under the left arm. Hence, by transference, it would be employed to denote at times the shield which it supported, and at other times a cuirass. Hence the aegis appears in works of art sometimes as an animal's skin thrown over the shoulders and arms, sometimes as a cuirass, with a border of snakes corresponding to the tassels of Homer, usually with the Gorgon's head in the centre.

RESTORATION OF A STATUE OF ATHENA, WEARING THE AEGIS, A CUIRASS OF ANIMAL SKIN BORDERED WITH SNAKES AND BEARING THE HEAD OF A GORGON

**AEGISTHUS,** in Greek legend the son of Thyestes by his own daughter Pelopia (Hyginus, *fab.* 88). Having been exposed by his mother, he was found by shepherds and suckled by a goat (αἴξ), whence his name. His uncle Atreus, who had married Pelopia, took him to Mycenae, and brought him up as his own son. For the rest of his story *see* AGAMEMNON; ATREUS.

**AEGOSPOTAMI,** a small creek issuing into the Hellespont, north-east of Sestos, the scene of the decisive battle in 405 B.C. in which Lysander destroyed the last Athenian squadron in the Peloponnesian War (*q v*). The existence of a township is attested by coins of the 5th and 4th centuries.

**AEHRENTHAL, ALOYS LEXA VON,** COUNT (1854–1912), Austro-Hungarian statesman, was born at Gross-Skal, in Bohemia. He was the son of Baron (Freiherr) Johann Lexa von Aehrenthal and his wife Marie, *née* Countess [illegible]stein, and began his diplomatic career in 1877 as attaché to the Paris embassy under Count Beust. He went in 1878 in the same capacity to St. Petersburg, and from 1883 to 1888 he worked at the Foreign Office in Vienna under Kalnoky, with whom he formed close relations. In 1888 he was sent as councillor of embassy to St. Petersburg, where he exercised considerable influence with the ambassador, Count Wolkenstein. Recalled in 1894 to service in the Foreign Office, he undertook important duties, and in the following year went to Bucharest as ambassador. Here he succeeded in strengthening the relations between the courts of Vienna and Bucharest, the secret alliance which King Charles had concluded in 1883 with the Central European Powers being renewed on Sept. 30. In 1899 he became ambassador in St. Petersburg, where he remained until his appointment as Foreign Minister in Oct. 1906. Aehrenthal at this time thought that Austria-Hungary must, even at the cost of some sacrifice, come to an agreement with Russia. In this sense he endeavoured to continue the negotiations successfully begun by his predecessor, Prince Franz Liechtenstein (1853–1938), for bridging over the difference on Balkan questions between Vienna and St. Petersburg, in order to create a basis for a permanent friendly relation between Austria-Hungary and Russia. He played a principal part in concluding the Mürzsteg Agreement of 1903. During the Russo-Japanese War he took a strong line in favour of a benevolent attitude on the part of the Vienna Cabinet towards Russia. When, in Oct. 1906, he succeeded Count Goluchowski as Foreign Minister he at first maintained the views which he had professed as ambassador. He was determined to preserve the interests of Austria-Hungary in the Balkans, but also showed himself prepared to meet the Russian wishes in the Dardanelles question. Accordingly he entered into negotiations, after the outbreak of the Young Turk revolution in the summer of 1908, with Isvolski, arranging with him Sept. 15 at the château of Buchlau, in Moravia, an agreement which aimed at securing for Austria-Hungary the annexation of Bosnia and Hercegovina and for Russia the opening of the Dardanelles to Russian warships.

It was only when Isvolski's proposals were wrecked on the opposition of England, and the Russian minister protested against the annexation of Bosnia and Hercegovina, which had meanwhile been accomplished, and supported the Serbs in their opposition to Austria-Hungary, that Aehrenthal abandoned the idea of a friendly accommodation with the Russian Government. In the sharp struggle during the annexation crisis, not only with Russia and Serbia, but with the Western Powers, he held with tenacious energy to his purpose, and, powerfully supported by Germany, succeeded in carrying out his intentions after excited negotiations which threatened to lead to war. The annexation of Bosnia and Hercegovina was acknowledged by the Powers; an agreement was reached with Turkey; Serbia, after long hesitation, was obliged to submit. For this achievement Aehrenthal was rewarded by his master by elevation to the rank of Count (Aug. 18, 1909), while at the courts of his opponents he was hated but respected.

This was the zenith of his political career. Aehrenthal took the greatest pains to prove in all quarters after the conclusion of the annexation crisis, that Austria-Hungary cherished no far-reaching plans of conquest. In this spirit he offered the most decided opposition to those circles at the court of Vienna which advocated a bloody reckoning with Serbia. He held fast by the Triple Alliance, for he saw in this the surest bulwark of peace.

He sought to form the most intimate relations with the German Empire, but insisted on the independence of the Habsburg Monarchy, and energetically repulsed all efforts on the part of the German chancellery to set limits to that independence. A succession of agreements which he concluded with the Italian Foreign Minister Tittoni, enabled him to maintain correct relations with the Italian Government. Yet, by the maintenance of his peace policy, which had the full approval of the Emperor Francis Joseph, he came into serious conflict with Conrad von Hötzendorf. The battle, carried on with tenacious endurance, ended in 1911 with the victory of Aehrenthal and the resignation of Hötzendorf.

Aehrenthal married in 1902 Pauline, Countess Széchényi. He died Feb. 17, 1912. During his life the estimate of his policy fluctuated violently. On the one hand it was blamed as provocative, on the other as weak. After the disastrous result of the World War, bringing with it the downfall of the Habsburg Monarchy, it is still more difficult to answer the question whether the path pursued by Aehrenthal in foreign affairs was the right one. It is certain that the Entente Powers were drawn more closely together by the active part played, during his period of office, by Austria-Hungary in Balkan affairs. It is true that the chances of success for the Central Powers in an international struggle were better in the years 1909 and 1911 than in 1914. But the question remains undecided whether, if his activity had been longer continued, Aehrenthal would have been able to maintain the position of Austria-Hungary as a great power without an appeal to the decision of arms. There is no doubt that Aehrenthal was a statesman of considerable mark, a man of wide knowledge and well-ordered intelligence; he was ambitious, but not vain, and an untiring worker. Moreover, in moments of great excitement he was able to maintain outward calmness. He was convinced of his own value, but had no desire to parade it. The Emperor Francis Joseph esteemed him, stood by him in the good and evil hours of his administration of foreign affairs, and repeatedly refused to accept his tendered resignation.

*See* B. Molden, *Alois, Graf Aehrenthal: Sechs Jahre auswärtiger Politik Oesterreich-Ungarns* (1917); and the article "Aehrenthal" in the *Deutsche Nekrologen* (vol. xviii., 1917, pp. 230 *seq.*). (A. F. P.)

**AELFRIC,** called the "Grammarian" (*c.* 955–1020), English abbot and author, was educated in the Benedictine monastery at Winchester under Aethelwold, who was bishop there from 963 to 984. Aelfric gained some reputation as a scholar at Winchester, for when, in 987, the abbey of Cernel (Cerne Abbas, Dorsetshire) was finished, he was sent by Bishop Aelfheah (Alphege), Aethelwold's successor, at the request of the chief benefactor of the abbey, the ealdorman Aethelmaer, to teach the Benedictine monks there. He was then in priest's orders. Aethelmaer and his father, Aethelweard, were both enlightened patrons of learning, and became Aelfric's faithful friends.

It was at Cernel, and partly at the desire, it appears, of Aethelweard, that he planned the two series of his English homilies (ed. Benjamin Thorpe, 1844–46, for the Aelfric Society), compiled from the Christian fathers, and dedicated to Sigeric, archbishop of Canterbury (990–94). The Latin preface to the first series enumerates some of Aelfric's authorities, the chief of whom was Gregory the Great. In the preface he regrets that, except for Alfred's translations, Englishmen had no means of learning the true doctrine as expounded by the Latin fathers. The first series of 40 homilies is devoted to plain and direct exposition of the chief events of the Christian year; the second deals more fully with church doctrine and history. Aelfric denied the immaculate birth of the Virgin (*Homilies,* ed. Thorpe, ii. 466), and his teaching on the Eucharist in the *Canons* and in the *Sermo de sacrificio in die pascae* (*ibid.* ii. 262, *et seq.*) was appealed to by the Reformation writers as a proof that the early English church did not hold the doctrine of transubstantiation.

See *A Testimonie of Antiquitie, shewing the auncient fayth in the Church of England touching the sacrament of the body and bloude of the Lord here publikely preached,* printed by John Day (1567). It was quoted in John Foxe's *Actes and Monuments* (ed. 1610).

His Latin *Grammar* and *Glossary* (ed. J. Zupitza in *Sammlung englischer Denkmäler,* vol. i., 1880), were written for his pupils after the two books of homilies. A third series of homilies, the *Lives of the Saints,* dates from 996 to 997. Some of the sermons in the second series had been written in a kind of rhythmical, alliterative prose, and in the *Lives of the Saints* (ed W. W. Skeat, 1881–1900, for the Early English Text Society) the practice is so regular that most of them are arranged as verse by Prof. Skeat. By the wish of Aethelweard he also began a paraphrase (ed by Edward Thwaites as *Heptateuchus,* Oxford, 1698) of parts of the Old Testament, but under protest, for the stories related in it were not, he thought, suitable for simple minds. It has been suggested that this part of his life was chiefly spent at Winchester; but his writings for the patrons of Cernel, and the fact that he wrote in 998 his *Canons* as a pastoral letter for Wulfsige, the Bishop of Sherborne, the diocese in which the abbey was situated, afford presumption of continued residence there. He became, in 1005, the first abbot of Eynsham or Ensham, near Oxford, another foundation of Aethelmaer's. After his elevation he wrote an abridgment for his monks of Aethelwold's *De consuetudine monachorum,* adapted to their rudimentary ideas of monastic life; a letter to Wulfgeat of Ylmandun (*i.e.,* Ilmington on the borders of Warwickshire and Gloucestershire); an introduction to the study of the Old and New Testaments (about 1008, ed. William L'Isle in 1623); a Latin life of his master Aethelwold; a pastoral letter for Wulfstan, archbishop of York and bishop of Worcester, in Latin and English; and an English version of Bede's *De Temporibus. The Colloquium,* a Latin dialogue designed to serve his scholars as a manual of Latin conversation, may date from his life at Cernel. It is safe to assume that the original draft of this, afterwards enlarged by his pupil, Aelfric Bata, was by Aelfric, and represents what his own scholar days were like. The last mention of Aelfric Abbot, probably the grammarian, is in a will dating from about 1020.

BIBLIOGRAPHY.—Sketches of Aelfric's career are in B. Ten Brink's *Early English Literature (to Wiclif),* trans. H. M. Kennedy, New York, 1883, p. 105–12, and by J. S. Westlake in *The Cambridge History of English Literature* (vol. i., 1907, p. 116–129). An excellent bibliography and account of the critical apparatus is given in R. Wülker's *Grundriss zur Geschichte der angelsachsischen Litteratur* (Leipzig, 1885, p. 452–80). *See* also the account by Prof. Skeat in pt. iv. p. 8–61 of his edition of the *Lives of the Saints,* already cited, which gives a full account of the mss., and a discussion of Aelfric's sources, with further bibliographical references; and C. L. White, *Aelfric, a New Study of his Life and Writings* (1898) in the "Yale Studies in English." The *Canons* and the pastoral to Wulfstan were printed by B. Thorpe in *Ancient Laws and Institutes of England* (1840), and the life of Aethelwold was included by J. Stevenson in the *Chron. Monast. de Abingdon* (vol. ii., p. 253–66, Rolls Series, 1858). For the version of Aethelwold's *De Consuetudine Monachorum see* E. Breck, *A Fragment of Aelfric* (Leipzig, 1887), and for the version of Bede's *De Temporibus,* Oswald Cockayne, *Leechdoms, Wortcunning and Starcraft* (vol. iii. p. xiv-xix. and p. 233 *et seq.,* Rolls Series, 1866). *Alcuini Interrogatio et Sigewulfi Presbyteri in Genesin* (ed G. E. McLean, Halle, 1898) is attributed to Aelfric by its editor. There are other isolated sermons and treatises by Aelfric printed in Grein's *Bibl. V. A. S. Prosa* (vol. iii).

**AELIA CAPITOLINA.** The destruction of Jerusalem and the Temple in A.D. 70 was followed by a second revolt of the Jews. After their defeat Hadrian made the ruined Jerusalem into a Roman colony, Aelia Capitolina, subordinate to Caesarea, the then capital of Palestine (about A.D. 130). Aelia commemorated the emperor's family name; Capitolina is derived from Jupiter Capitolinus to whom a temple was built on the site of the Jewish Temple.

**AELIAN** (AELIANUS TACTICUS), Greek military writer of the 2nd century A.D., resident at Rome. He is sometimes confused with his namesake Claudius Aelianus (*q.v.*). Aelian's military treatise, Τακτικὴ Θεωρία, is dedicated to Hadrian, though this is probably a mistake for Trajan. and the date A.D. 106 has been assigned to it. It is a handbook of Greek, *i.e.* Macedonian, drill and tactics as practised by the Hellenistic successors of Alexander the Great. The author claims to have consulted all the best authorities, the chief of which was a lost treatise on the subject by Polybius. Perhaps the chief value of Aelian's work lies in his critical account of preceding works on the art of war and in the fullness of his technical details in matters of drill. Critics of the 18th century thought Aelian greatly inferior to Arrian, but on

the Byzantines, and on the Arabs, who translated the text for their own use, Aelian exercised a great influence. The emperor Leo VI. incorporated much of Aelian's text in his own work on the military art. The Arabic version of Aelian was made about 1350. The copious details to be found in the treatise made it valuable to the army organizers of the 16th century The Macedonian phalanx of Aelian had many points of resemblance to the solid masses of pikemen and the "squadrons" of cavalry of the Spanish and Dutch systems, and the translations made in the 16th century formed the groundwork of numerous books on drill and tactics. It has been suggested that Aelian was the real author of most of Arrian's *Tactica*, and that the Τακτικὴ Θεωρία is a later revision of this original, but the theory is not generally accepted.

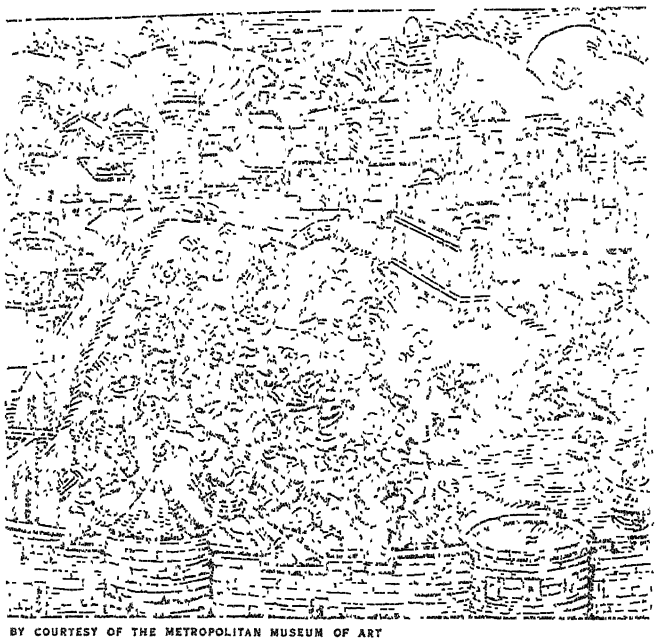
BIBLIOGRAPHY.—First edition of Greek text by Robortelli (Venice, 1552); the Elzevir text (Leyden, 1613) has notes. The text in W. Rüstow and H. Köchly's *Griechische Kriegsschriftsteller* (1855) has a translation, notes and reproductions of the original illustrations.

*See* Baumgärtner's plans in his *Sammlung aller Kriegsschriftsteller der Griechen* (Mannheim and Frankenthal, 1779), reproduced in 1785 as *Von Schlachtordnungen*, trans. Viscount Dillon (1814). *See* also R. Förster, *Studien zu den griechischen Taktikern* (*Hermes*, xii. 1877, pp. 444–49); F. Wustenfeld, *Die Geschichte der Muhammedaner und die arabische Uebersetzung der Taktik des Aelianus* (Gottingen, 1880); M. Jähns, *Geschichte der Kriegswissenschaften*, i. 95–97 (Munich, 1889); Rustow and Köchly, *Geschichte des griechischen Kriegswesens* (1852); A. de Lort-Sérignan, *La Phalange* (1880); P. Serre, *Études sur l'histoire militaire et maritime des Grecs et des Romains* (1887); K. K. Muller, in Pauly-Wissowa, *Realencyklopädie* (Stuttgart, 1894).

**AELIAN** (CLAUDIUS AELIANUS), Roman author and teacher of rhetoric, born at Praeneste, flourished under Septimius Severus and probably outlived Elagabalus (d. 222). He spoke Greek so perfectly that he was called "honey-tongued" (μελίγλωσσος) and wrote in Greek himself. His chief works are: *De natura animalium*, curious stories of animal life, frequently used to convey moral lessons (ed. Schneider, 1784; Jacobs, 1832); *Variae historiae* in 14 books, some of which are fragmentary, consisting mainly of anecdotes of men and customs (ed. Lunemann, 1811). Both works are valuable for the numerous excerpts from older writers. Twenty *Peasants' Letters*, after the manner of Alciphron but inferior, are also attributed to him.

*Editio princeps* of complete works by Gesner (1556); Hercher (1864–66). English translation of the *Various History* only by Fleming (1576), and Stanley (1665) of the *Letters* by Quillard (French) (1895).

**AELRED** (AILRED, ETHELRED) (1109?–1166), English theologian, historical writer, and abbot of Rievaulx, was born at Hexham about the year 1109. In his youth he was at the court of Scotland as an attendant of Henry, son of David I. He renounced the prospect of a bishopric to enter the Cistercian house of Rievaulx in Yorkshire, founded in 1131 by Walter Espec. He was for a brief period abbot of Revesby, Lincolnshire, but in 1146 returned to Rievaulx as abbot. He led a life of the severest asceticism, and was credited with the power of working miracles. In 1164 he went as a missionary to the Picts of Galloway, where he accomplished a great work of pacification. Two years later he died at Rievaulx in the 57th year of his age. In 1191 he was canonized. His writings are voluminous and have never been completely published. Among them is the tract called *Relatio de Standardo*, an account of the Battle of the Standard (1138), better known than the similar account by Richard of Hexham but less trustworthy.



BIBLIOGRAPHY.—*See* the *Vita Alredi* in John Tynemouth's *Nova Legenda Anglie* (ed. C. Horstmann, 1901, vol. i. p. 41), whence it was taken by Capgrave. From Capgrave the work passed into the Bollandist *Acta Sanctorum* (Jan. ii. p. 30). This life is anonymous but of an early date. The most complete printed collection of Aelred's works is in Migne's *Patrologia Latina*, vol. cxcv.; but this does not include the *Miracula Hagulstaldensis Ecclesiae* which are printed in J. Raine's *Priory of Hexham*, vol. i. (Surtees Society, 1864). A complete list of works attributed to Aelred is given in T. Tanner's *Bibliotheca Britannico-Hibernica* (1748), pp. 247–248. The *Relatio de Standardo* has been critically edited by R. Howlett in *Chronicles, etc., of Stephen, Henry II. and Richard I.*, vol. iii. (Rolls Series, 1886).

**AEMILIA, VIA** or **AEMILIAN WAY.** (1) A high road of Italy, constructed in 187 B.C. by the consul M. Aemilius Lepidus, whence its name; it ran from Ariminum to Placentia, a distance of 176m. almost straight N.W., with the plain of the Po (Padus) on the right, and the Apennines on the left. The 79th milestone from Ariminum found in the bed of the Rhenus at Bononia records the restoration of the road by Augustus from Ariminum to the river Trebia in 2 B.C. The bridge by which it crossed the Sillaro was restored by Trajan in A.D. 100. The modern high road follows the ancient line, and has some original and some fine modern bridges After Augustus, the road gave its name to the eighth region of Italy.

(2) A road constructed in 109 B.C. by the censor, M. Aemilius Scaurus, from Vada Volaterrana and Luna to Vada Sabatia and thence over the Apennines to Dertona (Tortona), where it joined the Via Postumia from Genua (Genoa) to Cremona We must, however, suppose that a coast road from Vada Volaterrana to Genua at least existed before the Via Postumia was built in 148 B.C. According to Polybius the Romans had in his time built the coast road from the Rhone to Carthago Nova and it is incredible that the coast road in Italy itself should not have been constructed previously.

**AEMILIUS, PAULUS** (PAOLO EMILIO) (d. 1529), Italian historian, was born at Verona. He obtained such repute in his own country that he was invited to France in the reign of Charles VIII. in order to write in Latin the history of the kings of France, and was presented to a canonry in Notre Dame. He enjoyed the patronage and support of Louis XII. He died at Paris on May 5, 1529. His *De Rebus gestis Francorum* was translated into French in 1581, and has also been translated into Italian and German.

**AENEAS,** son of Anchises and Aphrodite. In Homer, he is represented as a favourite of the gods, who frequently interpose to save him from danger (*Iliad*, v. 311; xx. 308) as he was destined to rule the surviving Trojans after the war. The story of his emigration is post-Homeric, and is set forth in its fullest development by Virgil in the *Aeneid*. Carrying his aged father and household

gods on his back and leading his little son Ascanius by the hand he made his way to the coast, his wife Creusa being lost during the confusion of the flight. After a perilous voyage to Thrace, Delos, Crete and Sicily (where his father died), he was cast up by a storm, sent by Juno, on the African coast.

Refusing to remain with Dido, queen of Carthage, who in despair put an end to her life, he sailed from Africa, and seven years after leaving Troy, reached the mouth of the Tiber. He was hospitably received by Latinus, king of Latium, was betrothed to his daughter Lavinia, and founded a city called Lavinium after her. Turnus, king of the Rutuli, a rejected suitor, took up arms against

him and Latinus, but was defeated and slain by Aeneas on the river Numicius. The story of the *Aeneid* ends with the death of Turnus According to Livy (i. i. 2), Aeneas, after reigning a few years over Latium, was slain by the Rutuli; after the battle, his body could not be found, and he was supposed to have been carried up to heaven He received divine honours, and was worshipped under the name of *Iuppiter Indiges* (Dionysius Halic. i. 64).

*See* Schwegler, *Römische Geschichte* (1867); Roscher's *Lexikon*, s.v.

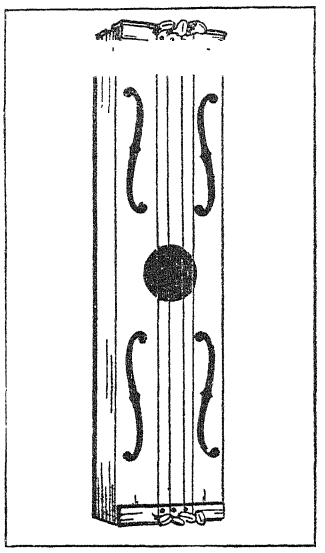
**Romances.**—The story of Aeneas, as a sequel to the legend of Troy, formed the subject of several epic romances in the middle ages. The *Roman d'Énéas* (*c.* 1160, or later), of uncertain authorship, the first French poem directly imitated from the *Aeneid*, is a fairly close adaptation of the original, but with the characteristic tone of a mediaeval romance. On this work were founded the *Eneide* or *Eneit* (between 1180 and 1190) of Heinrich von Veldeke, written in Flemish and now only extant in a version in the Thuringian dialect, and the *Eneydos*, written by William Caxton in 1490.

See *Énéas*, ed. J. Salverda de Grave (Halle, 1891); also A. Peij, *Essai sur la romans d'Énéas* (1856); A. Duval in *Hist. littéraire de la France*, xix.; Veldeke's *Eneide*, ed Ettmueller (Leipzig, 1852) and O. Behaghel (Heilbronn, 1882); *Eneydos*, ed F. J Furnivall (1890). For Italian versions *see* E. G Parodi in *Studi di filologia romanza* (v. 1887).

**AENEAS SILVIUS:** *see* Pius II.

**AENEAS TACTICUS** (4th century B C), Greek writer According to Aelianus Tacticus and Polybius, he wrote a number of treatises (ὑπομνήματα) on the art of war; the only one extant deals with the defence of fortified cities, and is chiefly valuable as containing a large number of historical illustrations. Aeneas was considered by Casaubon to have been a contemporary of Xenophon and identical with the Arcadian general Aeneas of Stymphalus, whom Xenophon (*Hellenica*, vii. 3) mentions as fighting at the battle of Mantinea (362 B C.).

Editions in I. Casaubon's (1619), Gronovius' (1670) and Ernesti's (1763) eds. of Polybius; also separately, with the notes by J. C. Orelli (Leipzig, 1818). Other texts are those of W. Rüstow and H. Kochly, *Griechische Kriegsschriftsteller*, vol. i. (Leipzig, 1853), and A. Hug, *Prolegomena Critica ad Aeneae . . . editionem* (Zurich univ. 1874), R. Schoene (Leipzig, 1911). *See* L. W. Hunter, *Aeneas on Siegecraft* (revised by S. A. Handford, 1927), an edition with translation and introduction, and the bibliography there given.



**AENESIDEMUS,** Greek philosopher, was born at Cnossus, in Crete and taught at Alexandria, probably during the 1st century B.C. He was the leader of what is sometimes known as the third sceptical school and revived to a great extent the doctrine of Pyrrho and Timon. His chief work was the *Pyrrhonian Principles* addressed to Lucius Tubero. His philosophy consisted of four main parts: the reasons for scepticism and doubt, the attack on causality and truth, a physical theory and a theory of morality. The reasons for doubt are given in the form of the ten "tropes": (1) different animals manifest different modes of perception; (2) similar differences are seen among individual men; (3) even for the same man, sense-given data are self-contradictory; (4) vary from time to time with physical changes, and (5) according to local relations; (6) and (7) objects are known only indirectly through the medium of air, moisture, etc., and are in a condition of perpetual change in colour, temperature, size and motion; (8) all perceptions are relative and interact one upon another; (9) our impressions become less deep by repetition and custom; and (10) all men are brought up with different beliefs, under different laws and social conditions. Truth varies infinitely under circumstances whose relative weight cannot be accurately gauged There is, therefore, no absolute knowledge, for every man has different perceptions, and groups his data in methods peculiar to himself. In attacking causality he adduces almost entirely those considerations which are the basis of modern scepticism. Cause has no existence apart from the mind which perceives; its validity is ideal. The relation between cause and effect is unthinkable. If the two things are different, they are either simultaneous or in succession. If simultaneous, cause is effect and effect cause. If not, cause must precede effect, and there must be an instant when cause is not effective, that is, is not itself. Thus he arrives at the fundamental principle of scepticism, the universal opposition of causes: παντὶ λόγῳ λόγος ἀντίκειται (*see* Scepticism).

For the immediate successors of Aenesidemus *see* Agrippa

*See* also Carneades and Arcesilaus Of the πυρρώνειοι λόγοι nothing remains; we have, however, an analysis in the *Myriobiblion* of Photius.

Bibliography.—*See* Zeller's *History of Greek Philosophy;* E Saisset, *Aenesideme, Pascal, Kant;* Ritter and Preller, sections 364–370; V. Brochard, *Les Sceptiques Grecs*, with bibliography (1923).

**AEOLIAN HARP,** a stringed musical instrument, played automatically by the wind. It consists of a long narrow sound box made of deal or pine over which ten or a dozen catgut strings of varying thickness are stretched. The sounds are produced by the play of the wind across the strings causing them to vibrate in aliquot parts, *i.e.* (the fundamental note not being heard) the half or octave, the third or interval of the twelfth, the second octave, and the third above it, in fact the upper partials of the strings in regular succession

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART NEW YORK

A SPECIMEN OF THE AEOLIAN HARP, WHICH WAS PLAYED AUTOMATICALLY BY THE WIND

The principle of the natural vibration of strings by the pressure of the wind was recognized in ancient times. King David, we learn from the Rabbinic records, used to hang his *kinnor* (*kithara*) over his bed at night, when it sounded in the midnight breeze. The same is related of St. Dunstan of Canterbury who was in consequence charged with sorcery. The Chinese at the present day fly kites of various sizes, having strings stretched across apertures in the paper, which produce the effect of an aerial chorus.

**AEOLINE,** the original and more elegant name of the humble instrument familiarly known as the mouth-organ, another name for it being the mouth-harmonica. It was invented in 1829 by Sir Charles Wheatstone, who also invented the concertina, embodying the same principle, and consists simply of free reeds arranged within a small metal box, so that, each reed having a separate air aperture, it is possible by moving the instrument to right and left against the lips, to produce different notes. The mouth-organ may be regarded as a humble relation not only of the concertina (*q.v.*) and the accordion (*q.v.*) but also of the harmonium (*q.v.*).

**AEOLIS** (Aeolia), an ancient district of Asia Minor, colonized at a very early date by Aeolian Greeks. The name was applied to the coast from the river Hermus to the promontory of Lectum, *i.e.*, between Ionia to south and Troas to north. The Aeolians founded twelve cities on the mainland, including Cyme, and numerous towns in Mytilene; they were said also to have settled in the Troad and even within the Hellespont.

**AEOLODION** (also known as Aeoline and Aeolodicon), one of several instruments of the harmonium type, invented and developed during the early part of the 19th century, having steel springs instead of the usual reeds. A closely similar instrument, employing wooden reeds instead of steel, was the aeolsklavier, and yet another was the aeolomelodicon or choraleon, in which the reeds were supplemented by brass tubes. The aeolopantalon in turn was in the nature of a combined harmonium and pianoforte designed so that either the one or the other could be used at will. None of these instruments succeeded in establishing itself.

**AEOLUS** (ī-ŏl-ŏos), in Greek mythology, according to Homer the son of Hippotes, controller of the winds, and ruler of the floating island of Aeolia. In the *Odyssey* (x. 1) he entertains Odysseus, gives him a favourable wind, and a bag in which the unfavourable winds are confined. To see what it contains Odysseus' companions open the bag; the winds escape and drive them back to the island, whence Aeolus dismisses them with

bitter reproaches. He has been identified with Zeus, and his six sons and six daughters with the 12 months According to Virgil, Aeolus dwells on one of the Aeolian islands to the north of Sicily, Lipara or Strongyle (Stromboli), where he keeps the winds imprisoned in a vast cavern (Virgil, *Aen.* i. 52).

**AEON,** or **EON,** a Greek term used to denote an indefinite duration of time; and hence an existence that continues for ever. In the latter sense it was used by the Gnostic sects to denote those eternal beings or manifestations which emanated from the one incomprehensible and ineffable God. (*See* GNOSTICISM.)

**AEPINUS, FRANZ ULRICH THEODOR** (1724–1802), German natural philosopher, was born at Rostock, Saxony, on Dec. 13, 1724. In 1757 he settled in St. Petersburg as member of the imperial academy of sciences and professor of physics, and remained there till his retirement in 1798. The rest of his life was spent at Dorpat, where he died on Aug. 10, 1802 Aepinus is best known by his researches, theoretical and experimental, in electricity and magnetism, and his principal work *Tentamen Theoriae Electricitatis et Magnetismi,* published at St. Petersburg in 1759, was the first systematic attempt to apply mathematical reasoning to these subjects. His discussion of the effects of parallax in the transit of a planet over the sun's disc excited great interest, having appeared (in 1764) between the dates of the two transits of Venus that took place in the 18th century.

**AEPYORNIS,** a genus of large extinct flightless birds, comprising the family Aepyornithidae and the order Aepyornithiformes of the Palaeognathae, they resembled the moas (*q.v.*) in many particulars, and inhabited the southern half of Madagascar up to, possibly, 200 years ago. They are said to have been the origin of the legend of the roc. *Ae. titan* reached a height of 10 ft., and the egg was larger than that of any other bird, measuring more than 13 by 9½ in. and having a capacity of more than 2 gal. (*See* ORNITHOLOGY.)

**AEQUI,** an ancient people of Italy, whose name occurs constantly in Livy's first decade as hostile to Rome in the first three centuries of the city's existence. They occupied the upper reaches of the valleys of the Anio, Tolenus and Himella; the last two being mountain streams [illegible] to join the Nar. They were not finally subdued until the end of the second Samnite War, when they seemed to have received a limited form of franchise. After the Social War the folk of Cliternia and Nersae appear united in a *res publica Aequiculorum* which was a *municipium* (*q.v.*) of the ordinary type. The Latin colonies of Alba Fucens (304 B.C.) and Carsioli (298 B.C.) must have spread the use of Latin (or what passed as such) all over the district; through it lay the chief (and for some time the only) route (via Valeria) to Luceria and the south. At the end of the republican period the Aequi appear, under the name Aequiculi or Aequicoli organized as a *municipium,* the territory of which seems to have comprised the upper part of the valley of the Salto, still known as Cicolano

Of the language spoken by the Aequi before the Roman conquest we have no record; but since the Marsi (*q.v.*) who lived farther east, spoke in the 3rd century B.C. a dialect closely akin to Latin, and since the Hernici (*q.v.*) their neighbours to the south-west, did the same, we have no ground for separating any of these tribes from the Latian group.

*See* the articles MARSI, VOLSCI, and the references there given; R. S. Conway, *The Italic Dialects,* pp. 300 *et seq.* (1897).

**AERARII,** a class of Roman citizens subject to a poll-tax arbitrarily fixed by the censor (from Lat. *aes,* in its subsidiary sense of "poll-tax") They were (1) the inhabitants of conquered towns who possessed the *ius conubii* and *ius commercii,* but no political rights; Caere is said to have been the first example of this (353 B.C.); (2) full citizens subjected to civil degradation (*infamia*) owing to their employment or to conviction for crime; (3) persons branded by the censor. Those who were thus excluded from the tribes and centuries had no vote, were incapable of filling Roman magistracies and could not serve in the army. According to Mommsen, the *aerarii* were originally the non-*assidui* (non-holders of land) The expressions "tribu movere" and "aerarium facere" are explained by A. H. J. Greenidge—the first as relegation from a higher to a lower tribe or total exclusion from the tribes, the second as exclusion from the centuries. Other views of the original *aerarii* are that they were: artisans and freedmen (Niebuhr); inhabitants of towns united with Rome by a *hospitium publicum,* who had become domiciled on Roman territory (Lange); only a class of degraded citizens, including neither the *cives sine suffragio* nor the artisans (Madvig); identical with the *capite censi* of the Serbian constitution (Belot, Greenidge).

BIBLIOGRAPHY.—*See* A. H. J. Greenidge, *Infamia in Roman Law* (1894), where Mommsen's theory is criticized; A. S. Wilkins in Smith's *Dict of Greek and Roman Antiquities* (3rd ed, 1891), J. E. Sandys, *Companion to Latin Studies,* with useful bibliography (1921); W. E. Heitland, *The Roman Republic* (1923).

**AERARIUM,** in ancient Rome the public treasury The treasury contained the moneys and accounts of the State, the standards of the legions, the public laws, the decrees of the senate, etc These were deposited in the temple of Saturn and, during the republic, were in charge of the urban quaestors (*see* QUAESTOR), under the control of the senate. In 28 B.C. Augustus transferred the *aerarium* to two *praefecti aerarii;* in 23 B.C. these were replaced by two praetors (*praetores aerarii* or *ad aerarium*), selected by lot during their term of office In addition to the common treasury, there was a special reserve fund, also in the temple of Saturn, the *aerarium sanctum* (or *sanctius*), originally consisting of the spoils of war, afterwards maintained chiefly by a 5% tax on the value of all manumitted slaves.

This fund was not to be touched except in cases of extreme necessity. Under the emperors the senate continued to have the nominal management of the *aerarium,* while the emperor had a separate exchequer, called *fiscus,* filled largely with the profits from the imperial domains in Egypt and elsewhere. But after a time, as the power of the emperors increased, this distinction virtually ceased. Besides creating the *fiscus,* Augustus also established in A.D. 6 a military treasury (*aerarium militare*), endowed by the emperor himself (see *Monumentum Ancyranum,* iii 35) and supported by the proceeds of the tax on public sales and the succession duty. Its administration was in the hands of three *praefecti aerarii militaris,* senators of praetorian rank

The *tribuni aerarii* have been the subject of much discussion By the *lex Aurelia* (70 B.C.) the list of *iudices* (jurymen) was composed, in addition to senators and equites, of *tribuni aerarii.* Whether these were the successors of the *tribuni aerarii* who in earlier times were paymasters of the troops, etc, or a new order closely connected with the equites, is uncertain. According to Mommsen, they were persons who possessed the equestrian census, but no public horse. They were removed from the list of *iudices* by Caesar, but replaced by Augustus According to Madvig, the original *tribuni aerarii* were not officials but private individuals of considerable means, who undertook certain financial work connected with their own tribes. The term was subsequently extended to include all those who possessed the property qualification that would have entitled them to serve as *tribuni aerarii.*

**AERATED BREAD.** Ordinary bread is leavened by yeast, the vesicular texture being imparted by the consequent fermentation, which produces carbonic acid gas. Dr. Dauglish invented a process by which bread is directly charged with carbonic acid gas, and to bread so lightened the name "aerated" is given. Machinery for the purpose was first devised about 1860 In the aerating process, the carbonic acid gas is supplied to the flour in conjunction with the water, and the lightening is thus performed without any decomposition whatever. For this reason it is claimed that aerated bread will agree with persons who find they cannot digest ordinary bread through the fermenting process continuing after the bread is eaten.

The mixing of aerated bread is performed in a hollow air-tight receptacle by the revolution of iron arms fixed upon a central spindle. Aerated water is pumped into the mixing receptacle at a very high pressure, and when the kneading is finished a valve is opened

at the bottom of the mixer and the dough is forced out by the elasticity of its contained carbonic acid gas. As the dough issues from the machine it is cut off in portions of the required weight and goes forward in tins to the oven. The aerated process is much quicker than the ordinary method of breadmaking with yeast, as with the former an hour and a half serves for the entire conversion of a sack of flour into baked loaves, whereas with the latter process four or five hours are occupied in the formation of the dough and a further period of approximately an hour and a half in the moulding and baking.

Perry and Fitzgerald developed a process for mechanically injecting carbon dioxide into a dough while it is being mixed, and claim a patent was issued on March 9, 1885. Their method differs from the Dauglish process in that the gas is injected directly into the mixer while the dough is being mixed. Bailey and Le Clerc, of the U.S. department of agriculture, published a method in which hydrogen peroxide is used as the aerating agent for leavening bread doughs and the like. Carbon dioxide in the compressed state known as "dry ice" has also been recommended as a means of aerating doughs for bread making purposes.

**AERATED WATERS** or **CARBONATED BEVERAGES.** These may be divided into two classes, namely, aerated table waters and effervescent beverages. The latter are flavoured and are known in the United States as carbonated beverages, also as "soda water," "soda" and "pop," and include ginger ales. Natural and synthetic flavours are used. Natural flavours are from fruits, nuts, roots, herbs, bark and leaves of plants. Synthetic flavours are also made in the laboratory.

A DEVICE FOR MEASURING SYRUP INTO AERATED WATER BOTTLES

The syrup enters from the bottom and ceases to flow when it reaches the air tube. The bottle, pressed against bottom nozzle, cuts off the supply tube and opens the discharge valve. The bottle when removed, closes the discharge valve and opens the supply tube and the syrup again enters

Aerated waters are essentially nonalcoholic beverages artificially saturated at the normal temperature with carbon dioxide, the pressure varying according to the type of beverage. Artificially aerated waters had their inception in Priestley's success in 1772 in producing aerated water in imitation of naturally aerated mineral spring water. Large-scale manufacture of aerated water was commenced by Paul at Geneva in 1790 and shortly afterwards by Schweppe in London. In the United States Priestley's experiments interested a Philadelphia physician, Dr. Philip Syng Physick, and he induced a chemist, Townsend Speakman, of the same city, to prepare carbonated water for his patients. Speakman added fruit juice as a flavour and the soft-drink industry in the United States started at that time, 1807. From the original conception of the imitation of natural carbonated water from springs the industry has broadened to include the production of aerated sweetened drinks and substitutes for beverages, such as cider, which are aerated by fermentation. The technique of large-scale aerated-water manufacture and the apparatus employed have undergone very considerable improvement since the beginning of the 20th century. Small-scale production of aerated water has also been rendered much simpler than formerly, when the cumbersome seltzogene apparatus was the only means for small-scale aeration of water.

**Raw Materials.**—Used in the manufacture of aerated waters are water, carbon dioxide, sugar and certain artificial sweeteners, acidifying materials, fruit juices, artificial fruit essences, essential oils, vegetable extracts, mineral salts and foam-producing materials.

The water employed must be unexceptionable as regards purity, both from chemical and bacteriological standpoints. To this end it is customary to filter the water through an effective filtering medium, for example, kieselguhr, unglazed porcelain, filter paper or cloth The water must also be free from objectionable colour, odour and taste. It is sometimes necessary to rectify waters which are either too hard or too soft for the purpose in view, also in some cases manufacturers use distilled water for special purposes

Carbon dioxide is produced as a by-product in the combustion of coke in burning limestone to quicklime, or from sulphuric acid and carbonates, or recovered as a by-product from fermentation processes. It is either made in a special gas generator in the aerated-water factory or is purchased in a highly compressed or liquefied state in steel cylinders. In either case it must be free from objectionable taste.

Dry ice is also used extensively with the aid of special apparatus by which the evolved gas may be led directly to the carbonator. Carbonation furnishes in the finished beverage a gaseous pressure of from 40 to 80 lb. per sq.in depending upon the type of product. High-pressure carbonation is used on ginger ales, and is carried on at about 55° and impregnates the beverages with as high as four and one-half volumes of gas. Low pressure is used on fruit drinks, at about 40° to 42° and as low as one volume of gas may be employed.

### THE SUGAR CONTENT

Sugar is specially manufactured for use in aerated-water production. The best grade canners' cane or beet sugar should be used. High grade dextrose and highly refined corn syrup are also used to some extent. The sugar is highly refined by animal charcoal, no blue material having been employed to produce whiteness. Especial care is taken in the refining process to render the sugar free from sediment or scum when made into syrup. Artificial sweeteners, of which saccharin is the chief, are permitted in some countries, and such sweeteners are employed for special purposes, as in cases where sugar is undesirable because of its tendency towards fermentation, or in periods when sugar is expensive or difficult to obtain. Saccharin may be obtained in very high degrees of sweetening power, for example 550 times the sweetening power of sugar. In the United States the use of saccharin is prohibited by the Federal Food, Drug and Cosmetic act and by the laws of many states.

The acidifying materials commonly used in aerated waters are citric acid, tartaric acid, malic acid, phosphoric acid and lactic acid. These acids should be free from metallic and arsenical contamination. They must be of edible grade.

**Fruit Juices and Fruit Concentrates** used for aerated or carbonated beverages are usually treated to eliminate the albuminous and pectinous matter and finally filtered, so that the finished beverages may be as clear as possible. However, there are also many natural fruit or combination of natural fruit and synthetic flavoured beverages with a cloudy appearance. Concentrated fruit flavours may consist of a blend of fruit juice and fruit oil, *i.e.*, from the peel of citrus fruits, and synthetic fruit esters, or a combination of two or more of these. Essential oils, *e.g.*, lemon, orange, lime, etc., are also employed for flavouring purposes, usually after they have been deprived of their insoluble terpenes and sesquiterpenes by fractional distillation. Vegetable extracts of either aqueous or alcoholic nature are prepared from herbs, roots and seeds for use in the production of ginger and herbal beverages. Mineral salts, *e.g.*, sodium bicarbonate, sodium sulphate, calcium chloride, sodium chloride, etc., are used in the preparation of table waters.

In some countries the use of small quantities of saponin bodies is permitted for the production of foam, such bodies being known as "froth-heading." Other substances which are used for this purpose are liquorice extract, for dark-coloured beverages, and various gums.

Colouring matter is frequently added to aerated beverages. This usually takes the form of burnt sugar or caramel for brown-

coloured drinks, and specially pure coal-tar colours for other beverages.

### BOTTLING METHODS

The apparatus used in aerated-water bottling is of a highly specialized nature. The bottles are washed by machines of various types, some of the larger being capable of cleansing 1,000 dozen bottles per hour. The bottling units are capable of measuring into each bottle the correct amount of syrup, filling with carbonated water, sealing and labelling. The bottles used for aerated-water bottling are of four main varieties: (1) Codd's bottles, in which the bottle is sealed by means of a glass marble held against an india-rubber ring by the gas pressure; (2) crown cork bottles, which are securely sealed by a cork-lined metal cap clamped on to a shallow boss on the top of the bottle mouth; (3) screw-stoppered bottles, in which a lignum-vitae stopper screws down on to an india-rubber ring; and (4) swing lever stoppered bottles, in which a porcelain stopper is held down on an india-rubber seating by a strong wire lever acting upon the bottle neck. In the United States the use of crown cork bottles is almost universal. Aerated beverages are also largely sold in siphons, the gas pressure serving to discharge the container. Aerated waters are very simply produced on a domestic scale, in protected siphons, the aeration being accomplished by means of carbon dioxide contained in small steel cylinders.

**Typical Compositions** of various types of both table waters and sweetened aerated waters vary widely, each manufacturer adjusting his product according to his judgment of popular taste and the type of water he is using. The following examples of dosage for the production of table waters are given, taking soft or distilled water as a basis.

**Soda Water.**—Three and one-half oz. of a mixture of sodium carbonate 15 parts, magnesium chloride 6½ parts, calcium chloride 6½ parts, are dissolved in 10 gal. of water. This is strictly a table water and should not be confused with the term "soda water" used in the United States for flavoured beverages.

**German Table Water.**—Five and one-half oz. of mixture of sodium carbonate 10 parts, sodium chloride 10 parts, sodium sulphate 1 part, magnesium chloride 8 parts, calcium chloride 5 parts, are dissolved in 10 gal. of water.

The dosage employed in the preparation of aerated imitations of natural mineral waters (*see* MINERAL WATERS) is much heavier than in the preparation of table waters, and many salts are included which have well-marked medicinal properties.

The basis of sweetened aerated waters is the syrup, which contains the acidifying material, flavour and colouring matter in addition to the sugar. Usually the syrup contains about 60% of sugar and is employed in the proportion of 1 to 2 oz. for bottles of from 6–12 oz. of finished beverage. The sugar content of carbonated beverages in the United States is from 6–17%, an average of 11%. This is a food value of approximately 80–100 calories for 8 oz. of beverage. The acidity of the syrup is equivalent to from 0.5% to 1.0% citric acid, depending on the flavour used and on the taste desired in the finished beverage. The colouring matter is varied according to the type of fruit which the drink represents. Most essences employed for flavouring aerated beverages are standardized so that they may be used to the extent of 1½–2 oz. per gallon of syrup.

Thus in the preparation of a lime-juice syrup the following essence may be used in the proportion of 2 oz. per gallon of syrup: terpeneless West Indian distilled oil of limes 1 part, alcohol 60° O.P. 28 parts, distilled water 16 parts. In the preparation of beverages of an herbal or root-beer type, a smaller proportion of syrup is employed so that the beverages may not be too sweet.

Also, a small proportion of foam-producing material may be employed.

**Consumption.**—In the United Kingdom, the dominions and other countries where the sale of alcoholic beverages is permitted, consumption of aerated nonalcoholic drinks depends largely on weather conditions and on prices. Taking as example the United Kingdom, the sale of aerated beverages in many years has been restricted by the succession of wet, cold summers and by the high prices of such drinks consequent upon burdens being placed upon the industry by the government.

Only a small proportion of the total production of table waters was exported. As regards the imports of table waters, these were almost wholly of an unsweetened nature, and they amounted to about 8% of the quantity of similar waters produced in the United Kingdom as shown by the reports of the commissioners of customs and excise.

There has been a tremendous increase in the consumption of "soft drinks" in the United States during recent years as a result of increased capacity for production enabled by inventions and improvements of manufacturing equipment, co-operation of the manufacturers through their trade associations with state and federal authorities to prevent the use of inferior ingredients and to promote highest standards of sanitation in manufacturing and marketing, and to extensive advertising.

According to statistics issued by the American Bottlers of Carbonated Beverages, the national trade association of the manufacturers of "soft drinks," the bottled soft drink industry in the United States consisted in 1943 of more than 6,000 plants, with an estimated total investment of $500,000,000 to $600,000,000, employing between 80,000 and 100,000 people, and operating more than 50,000 trucks.

The industry uses more than 250,000 tons of sugar annually, according to a 1943 estimate of the United States department of agriculture, and the association estimates that the annual sales of bottled soft drinks, based on the biennial census of manufactures and other known factors, was for the period 1935–43 as follows.

| *Year* | *Value of Production* | *Year* | *Value of Production* |
|---|---|---|---|
| 1935 | $159,939,553 | 1940 | $411,699,200 |
| 1936 | 211,271,670 | 1941 | 553,834,160 |
| 1937 | 278,616,036 | 1942 | 502,656,000 |
| 1938 | 325,911,074 | 1943 | 444,250,000 |
| 1939 | 361,690,917 | | |

**AERIAL,** an elevated wire or group of wires forming the principal part of a radio antenna of the open or "condenser" type. (*See* ANTENNA.)

**AERIAL LAW** (AIR LAW), the law governing use of the airspace and occurrences therein. Although the air is traversed by a variety of objects, such as projectiles and domesticated birds, capable of creating legal problems, the problems arising out of the growing use of aircraft so overshadow all others that in practical effect air law is the law of aircraft. A strict interpretation might exclude legal problems arising out of the contact of aircraft with the ground, or their presence on the ground; but in common practice the phrase is taken to include such problems as well as those arising during actual flight. Thus the major bodies concerned with the study of air law have given attention to such matters as the conditions of use of airports and the liability of the owners of a wrecked aircraft to its salvagers, as well as to the problems engendered during actual flight.

**Sovereignty.**—The two most fundamental questions of air law are those of national sovereignty in airspace and of private ownership therein. The former, no longer a practical question, had been settled, at least from 1919, by universal recognition that sovereignty in airspace, elsewhere than over the high seas, is held by the sovereign of the underlying territory.

In the early days of air navigation, when pilots of free balloons were unable to control their course but, on the other hand, were not subject to the liability of immediate forced descent as the result of mechanical failure, a considerable body of jurists (mainly of French nationality) maintained an analogy between the upper air and the high seas, both alike being held free of national jurisdiction. The early aeroplanes, however, with their periodic reminders that gravity operated even at the highest levels, and that forced descent held hazards for persons and property on the surface, introduced an element for which the high seas had no analogy. Growing fear of aerial espionage as World War I approached made it increasingly plain that governments would insist

on the prerogatives of national sovereignty in airspace as a condition of national safety. Following that war there was even less likelihood that nations would forego the assertion of sovereign right in the airspace above their territory; and discussions of the public law of the air thereafter invariably proceeded on the assumption that they would not.

**Privileges of International Flight.**—Although sovereignty has thus been long unchallenged, nations may agree among themselves to restrict the exercise of their sovereignty in any way and to any extent that they find advantageous In particular, they are able to concede to one another the right for their aircraft to pass through one another's airspace, subject only to such limitations as they may agree to impose. Provisions of that character appeared in two major international conventions on the navigation of the air drawn after World War I: (1) the convention relating to the regulation of aerial navigation, opened for signature at Paris on Oct. 13, 1919; and (2) the convention on international civil aviation, opened for signature at Chicago on Nov. 1, 1944, which superseded the convention of Paris. The two conventions were alike in granting civil aircraft registered in any contracting country the right of free passage through the airspace of other contracting countries, provided that such aircraft were not engaged in the operation of a regular air transport service. Establishment of such regular services, on the other hand, was possible only through supplementary agreements among the nations concerned. The pertinent provisions of the Chicago convention which was in force among 58 nations at the beginning of 1950 follow:

> Each contracting State agrees that all aircraft of the other contracting States, being aircraft not engaged in scheduled international air services, shall have the right, subject to the observance of the terms of this Convention, to make flights into or in transit non-stop across its territory and to make stops for non-traffic purposes without the necessity of obtaining prior permission, and subject to the right of the State flown over to require landing. (Art. 5)
>
> No scheduled international air service may be operated over or into the territory of a contracting State, except with the special permission or other authorization of that State, and in accordance with the terms of such permission or authorization. (Art. 6)

The Chicago convention of 1944 was more restrictive than its predecessor of 1919 in respect of aircraft engaged in commercial services other than those of scheduled air transportation (*e.g.*, the carriage of cargo by special contract). Under article 5 such operations were made subject to the right of any country in which commercial loads were to be picked up or discharged "to impose such regulations, conditions or limitations as it may consider desirable." During the first years of operation under the Chicago convention this provision was interpreted by numerous nations to require prior permission for any commercial flight of a foreign aircraft into their territory, and thereby substantially to nullify the benefits of the general declaration of right to fly internationally without securing prior permission, insofar as such aircraft were concerned.

The privilege of freedom of aerial transit and landing was extended to scheduled air transport services by a supplementary agreement, the International Air Services Transit agreement, also drafted at the Chicago conference of Nov. 1944. This agreement did not convey any right to engage in commerce within the territories of the participating nations, but the latter did grant to each other's regular air lines the privileges of flying across their territory without landing, and of landing for refuelling or mechanical attention. It was thus possible to establish a regular air service between the United States and Sweden, for example, merely by agreement between those two countries, and to land the aircraft of such a service at intermediate points for refuelling, since Canada, the United Kingdom (for Newfoundland), Iceland and Norway, as well as the United States and Sweden, had signed the agreement. By the end of 1949 the agreement had been accepted by 40 countries; but a number of countries occupying geographical positions of major importance along the world's air routes, such as France, Brazil, China, Ireland and Portugal, still withheld acceptance.

**National Legislation on Air Navigation.**—In virtually every nation, legislation had been adopted by 1948 to define the conditions under which civil aircraft might operate. Such legislation had of course to be in conformity with the terms of any international convention to which the nation was a party, and in many cases was based largely upon the Chicago convention

All such statutes provided for the registration of aircraft and for the verification of their airworthiness; for the licensing of operating personnel; and for the making of appropriate safety regulations In some instances, certain of the rules on these subjects were set out in some detail in the legislation itself; but it had become more usual practice for the legislation to empower the executive to adopt appropriate regulations and amend them from time to time without reference to the legislative body

It became general practice, too, for the national government to establish and operate airports, radio aids to navigation and other facilities for air navigation. In many cases the legislation provided for a measure of economic regulation, or defined the conditions under which private interests might be allowed to engage in air transportation or other commercial activities in the air. Sometimes all these subjects were treated in a single act, but more often they required several pieces of legislation.

The cases of the United Kingdom and the United States may be taken as representative examples. In the United Kingdom the first effective legislation of this character was the Air Navigation act of 1920, drawn to give effect to the terms of the Paris convention of 1919. The supersession of the Paris convention by that of Chicago made new legislation necessary, and the Air Navigation act of 1947 was enacted. The act was a simple one, its principal effect being to permit the executive (*i.e.*, the minister of civil aviation) to issue orders in council for carrying out the Chicago convention and any international standards adopted in accordance therewith, and generally for regulating air navigation. The British act also authorized orders in council to apply customs regulations to the movement of aircraft, to regulate service charges at aerodromes and the conditions of commercial carriage of passengers or goods, and to prohibit the display of any signal or light likely to endanger aircraft. The last point, appearing also in U.S. legislation, was noteworthy as acting, in the interest of the safety of air navigation, to impose obligations or prohibitions upon ground personnel not themselves connected with aeronautics. (For further examples see *The Law of Airports,* below.)

In the United States the introduction of national legislation was complicated by constitutional questions. The first legislation was that of individual states; some of which (Connecticut first) adopted aircraft acts as early as 1914.

The possible extent of the federal government's jurisdiction over civil flight was widely debated in the years immediately following 1918. It came to be generally accepted that interstate operations might be regulated under the interstate commerce clause of the constitution, even though such operations were not explicitly "commercial" in the ordinary sense of the word; and the Air Commerce act of 1926, the first national legislation of the sort, assumed that power. The rules of flight and those affecting aircraft navigation lights and kindred equipment applied under the Air Commerce act to all aircraft operations within the territory of the United States, since a violation of the rules of the air by any aircraft would be an obvious hazard to other aircraft engaged in the interstate operations to which the act directly related. The obligation to prove the airworthiness of aircraft and the competence of the flying personnel and to register the aircraft and secure personnel licences applied under the act only to aircraft and personnel engaged in interstate operations. Those operating within the bounds of a single state were exempt from licensing requirements, except insofar as a number of states adopted legislation to make the holding of federal licences and aircraft registrations a necessary requirement of flight within their territory. Other states set up licensing systems of their own, with a duplication of state and federal authority and of examination and inspection procedure resulting in some cases.

In 1941 the Civil Aeronautics board, to which federal regulatory powers had been transferred from the secretary of commerce,

adopted regulations to require that all aircraft and personnel operating within the United States, even in operations of purely intrastate character, be registered and licensed, on the ground that operation with flight personnel and equipment not meeting fixed and uniform standards would constitute an inherent hazard to interstate operations. Although there was some opposition to that extension of regulatory power, the requirements were upheld (the leading case being *U.S.* v. *Drumm,* U S District court of Nevada, 1944) so that the licensing system became nation-wide. Other federal commonwealths had constitutional difficulties analogous to those in the United States—especially Australia

The Air Commerce act of 1926 was concerned almost exclusively with air navigation, authorizing the secretary of commerce to make safety regulations, grant licences and registrations and install and operate facilities necessary to safe navigation, such as airway lights and radio stations. Airports were expressly excluded from the authorization, since municipalities and private interests were expected to provide them. The Air Commerce act was superseded in 1938 by the Civil Aeronautics act, which created a new tribunal of five members to exercise most of the powers previously assigned to the secretary of commerce and also to preside over a new system of economic regulation of air lines, determining (among other things) on what routes operations should be permitted by U S. lines, what line should serve each route, and what compensation the operator should receive from the government for carrying the mail. In 1940 a further change was made and the administrative functions under the act were returned to the department of commerce, but air navigation regulations continued to be adopted by the five-man Civil Aeronautics board.

**Private Ownership in Airspace.**—In the case of private ownership, the trend was opposite to that in national sovereignty. It was toward freedom of flight, rather than away from it.

The traditional rule, as cited by Sir William Blackstone but recognized long before his time, was that the ownership of the surface of the land conveyed rights extending indefinitely upward and downward, and in particular included all the airspace above the surface property. (For more detailed discussion, *see* Carl Zollmann, *Law of the Air* [1927]; Harold L. Brown, *Aircraft and the Law* [1933].) The right of real-property owners to make unlimited use of the airspace above their property, with only a few exceptions (see *The Law of Airports,* below) remained valid, but courts were virtually unanimous in holding that ownership conveys no right to forbid, or to receive compensation for, the passage of aircraft through that part of the airspace of which the owner is currently making no effective use. He might erect a tower 1,000 ft. high on his property, if he so desired (subject to zoning regulations) but if the actual structures that he erects are of no more than ordinary building heights, he cannot successfully claim trespass by aircraft which pass over his property, even though at an altitude much less than 1,000 ft. To make his claim good, the property owner must show the area of his actual use to have been invaded.

A decision by the U.S. supreme court (*Causby* v. *United States,* 1946) reads explicitly on this subject, as follows: "It is ancient doctrine that at common law ownership of the land extended to the periphery of the universe—*Cujus est solum ejus est usque ad coelum.* But that doctrine has no place in the modern world. The air is a public highway, as congress has declared. Were that not true, every transcontinental flight would subject the operator to countless trespass suits Common sense revolts at the idea. To recognize such private claims to the airspace would clog these highways, seriously interfere with their control and development in the public interest, and transfer into private ownership that to which only the public has a just claim."

In considering whether there has been actual damage to the property holder, indeed, the rights of ownership are irrelevant. Claims have been successfully pressed on grounds of nuisance, of jeopardy to frightened livestock, etc., even when the aircraft alleged to have made the trouble clearly had not passed above the complainant's premises. The reality of nuisance or material damage has been the test.

**The Law of Airports.**—Actions for aerial annoyance come most frequently from people domiciled near airports where aeroplanes pass constantly along the same course and necessarily at comparatively low altitudes. In a number of cases courts have enjoined the establishment or the continued operation of airports where a strong showing of injury to the neighbours was made. The British Air Navigation act of 1949 met the resultant hazard to airport operation by a provision that no action should lie in respect of nuisance by reason of the noise and vibration caused by aircraft on any aerodrome on which the terms of any order in council regulating such matters had been complied with The aerodrome management complying with the government's direction thus became immune from legal attack.

The property owner may seek to restrict the airport, but the airport may also restrict the adjacent property owner through appropriate legislation or regulation to prevent his use of his property in a fashion which would handicap or create hazards for air navigation Numerous cities in the United States have adopted zoning regulations prohibiting the erection of structures of more than a limited height in the neighbourhood of airports—the allowed height usually decreasing as the ends of the airport runways are more nearly approached. Such zoning must of course not be so extreme in character as to work serious hardship on landowners. Where it would do so, as for example if safety of flight required that the structures on a given piece of land be only a few feet in height or even that there be no construction at all, compensation would have to be paid The acquisition of the owner's rights in the airspace above his property, compensating him for a surrender in perpetuity of the right to occupancy above a stated level, is a possibility where such extreme restrictions are necessary; but airport zoning ordinarily imposes only moderate restrictions, and entails no compensation.

In most countries aerodromes are nationally licensed, and unlicensed places can be used for the landing and taking off of aircraft only under restrictive conditions, if at all. In the United States no such licensing exists, and any attempt to establish it might encounter constitutional difficulties on the ground that an airport is purely an intrastate activity, exempt from national regulation. The federal government's potential powers over airports derive from the attachment of appropriate conditions to the grant of national aid from which most airports have benefited, and from the power to make flight regulations prohibiting aeroplanes from landing and taking off at airports not possessing suitable characteristics. The latter power, however, has been but little used. (For an extensive discussion of the legal problems engendered by airports, *see* Charles S. Rhyne, *Airports and Courts* [1944].)

**Private Air Law.**—Private air law relates in general to the commercial relationship existing between the operators of aircraft and other persons. It is distinguished from public air law as represented in the Chicago convention; but the distinction cannot always be drawn with precision. It includes questions of liability for damage, the legal status of mortgages on aircraft, the special legal problems arising out of the insurance of aircraft and their occupants, etc. The extreme mobility of aircraft and the frequency with which they cross international boundaries made it particularly necessary that such matters be the subject of international agreement, to guard against conflict of jurisdiction, escape from obligation by transfer of property across a national boundary, or inequitable variations of practice from one point along a flight path to another. It would be manifestly inequitable, for example, if the amount recoverable by the heirs of the victim of an air transport accident were to be largely dependent upon the particular national territory within which the accident occurred.

Such subjects were for 20 years the care of the Technical Committee of Experts on Air Law (usually known as C.I.T.E.J.A., from the initials of the organization's French name) established on May 17, 1926, and absorbed into the International Civil Aviation organization in 1947. The members of C.I.T.E.J.A. did the preparatory work on the development of private law conventions, which were then formally considered for adoption

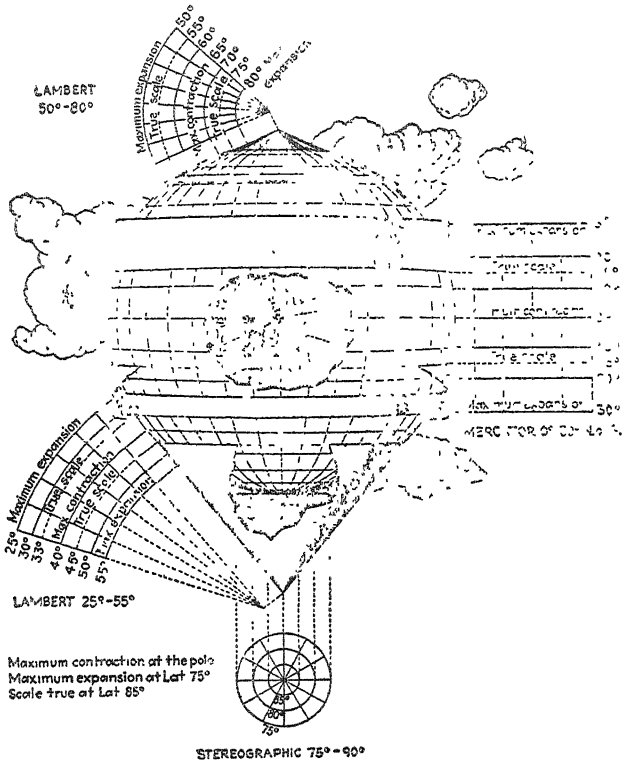
and opened to signature at international conferences on private air law. Conferences were held at Paris in 1925 (where C.I.T.E.J.A was initiated), at Warsaw in 1929, at Rome in 1933, and at Brussels in 1938. The most important accomplishment resulted from the second conference, and became commonly known as the Warsaw convention. Its primary purpose was to define the liability of air lines to passengers and shippers in case of disaster. It was widely accepted in Europe and to some extent elsewhere, although the 37 countries which had ratified the convention by Jan 1, 1950 (excluding countries which no longer existed), included only 2 of the 20 Latin American nations The limits of liability established by the convention were (at the dollar value of gold current in 1950) $8,290 for each passenger and $7 50 per pound for cargo. These figures were low as judged by the domestic practice of some nations, notably the United States, but high by the standards of others. Much preparatory work was being done in 1946–50 on the revision of the convention.

The conference at Rome in 1933 produced two conventions, the more significant of which governed the conditions and amount of liability of the operator of an aircraft for damage caused to parties on the ground It set a maximum operators' liability for a single accident at approximately $7.50 per pound of gross weight of the aircraft causing the damage, but with the further provision that the total liability could not in any case exceed $133,000, whatever the size of the aircraft. To secure the benefits of these limits the convention provided that an aircraft operator must maintain a continuous guarantee of his readiness to meet claims, either by having insurance or by keeping a bond posted The limits set may appear low; but it is obviously impossible for the operator of an aircraft to be bound to pay the full extent of any damage that an accident might cause to property on the surface. A single aircraft overtaken by disaster might cause a fire or explosion resulting in millions of dollars of damage. Even though limits were placed several times as high as those of the Rome convention, it would still be necessary for property owners wishing security to the full extent of possible damage to carry their own insurance against the results of an air disaster.

The Rome convention complemented that of Warsaw. Taken together, they defined substantially the total liability of an aircraft operator.

Another convention prepared at the conference in Rome dealt with the precautionary attachment of aircraft to ensure the satisfaction of claims against the owner, and exempted aircraft used in commercial transportation from such attachment.

Neither of the two Rome conventions had any extensive acceptance by the beginning of 1950. That on liability for damage on the ground had been ratified by only 5 countries, including Belgium and Brazil alone among the major operators of air transportation; and that on precautionary attachment by only 13. A revision of the convention on liability for damage on the ground was being actively developed in I.C.A.O.'s legal committee.



The conference at Brussels in 1938 produced a convention on the legal consequences of assistance and salvage of aircraft (or by aircraft) at sea. It fixed the maximum indemnity payable by operators of shipwrecked aircraft to rescuing vessels or aircraft at a maximum of approximately $3,300 per person saved, or not in excess of $33,000 in any instance. Supplementary provisions allowed additional indemnity for the saving of valuable property. Through 1949, the Brussels convention had not been ratified by any nation.

At the end of 1947 the work of developing such conventions had been transferred to the International Civil Aviation organization (I.C.A.O ). The 1948 assembly of I.C.A.O. adopted a convention on the registration of liens and mortgages on aircraft, to safeguard the mortgagee and thus make it easier to place such mortgages. Up to the summer of 1950, only the United States and Mexico had ratified the new convention.

**AERIAL NAVIGATION.** Aerial navigation is the science which deals with the methods used to direct an aircraft in flight from one place to another, to determine its position while en route and to predict its time of arrival at some specified point on the route.

The study of air navigation is usually classified into four general methods: (1) pilotage; (2) dead reckoning; (3) radio navigation; and (4) celestial navigation.

FROM P. V. H. WEEMS, "AIR NAVIGATION" (MCGRAW-HILL)

FIG. 1.—ILLUSTRATION OF AERONAUTICAL CHART PROJECTIONS

**Pilotage.**—Pilotage is the method of directing aircraft from place to place by referring to visible landmarks on the earth's surface, such as church spires, lighthouses, beacons, railroads, rivers, mountains and lakes. In normal flight over land, with a suitable map and good visibility, the pilot guides his plane much as a tourist directs his automobile from a road map, by simple piloting, which is nothing more nor less than comparing objects observed from the plane with objects shown on the map.

*Aids to Night Pilotage.*—Types of aeronautical lights that are widely used in night pilotage or conditions of low visibility are:

1. Beacon lights, which mark major airways and airports. They consist of a searchlight which throws a beam of white light elevated several degrees above the horizontal and rotates six times per minute. Many of these beacons have auxiliary coloured lights which are used for identification or directional purposes. A green auxiliary light indicates the proximity of a lighted airport.

2. Approach lights, which are used as landing aids to pilots after the completion of instrument approaches. They are of several types and are arranged in several configurations. In general, they extend out from the end of the "instrument" runway and are of high intensity, so as to give the pilot a visual reference to the ground after the radio signals have led him down through the overcast to an altitude of from 200 to 500 ft.

*Maps and Charts.*—A map or chart is a representation of the earth's surface or a part of it on a flat piece of paper. An accurate chart is probably more important than any other item of equipment. If the destination is not in sight at the start, the navigator's first act is to look at the map to find the direction in which he must go to reach the desired destination. In the course of the flight, as the navigator fixes his position by any or all of the various methods, he plots his fix or determined position on

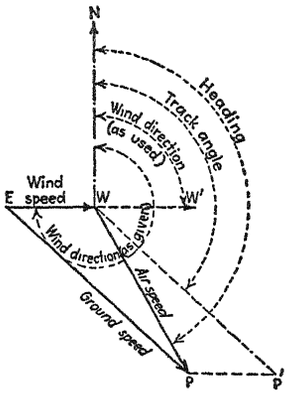
the chart and checks the direction from this fix to the destination

Aeronautical charts have been designed and published in several series for use in contact flight, where pilotage is the primary method of navigation. Local charts on a scale of 1:250,000 were published for congested areas around important terminals. Sectional charts were published for the entire United States and for many foreign areas on a scale of 1:500,000, and came into general use for pilotage. By international agreement a world series of uniform charts on a scale of 1:1,000,000 was planned for pilotage on flights of aircraft with moderate to high air speeds.

*Chart Projections*—The spherical surface of the earth obviously cannot be represented on a flat piece of paper without some distortion of certain features. In an ideal chart, distances, bearings, shapes and areas would be shown in their true relation, and the shortest distance between two points would be represented by a straight line. It is possible to preserve one of these properties by sacrificing some of the others, and maps are constructed by various methods of projection in order to preserve that feature which will be most useful for the particular purpose the map is to serve.

The principal projections used for aviation charts are the Mercator and Lambert conformal projections. The gnomonic projection is used to determine the great circle (shortest) route between distant terminals, and the stereographic projection is in general use for navigation in polar areas.

The stereographic chart is formed by projecting the earth's surface on a plane with the observer 180° away from the point of tangency of the plane. The stereographic chart is indicated for the south polar area with observer standing at the north pole (*see* fig. 1).



**Theory of Dead Reckoning.**—Dead reckoning is the method of determining a position by keeping an account, or reckoning, of the course and distance run from a previously known position called the point of departure.

Dead reckoning requires a knowledge of the direction and the speed of flight. In still air (*i.e.*, in the absence of wind) direction is obtained from the compass reading; the speed is read from the air speed indicator, and the navigator's task is simple. Generally, however, the position of an aircraft on the surface of the earth is the resultant of two distinct motions: the motion of the plane in the direction in which it is headed because of the driving power of the engine; and the motion of the air ocean itself relative to the earth, which is commonly referred to as the wind.

Hence, the navigator needs to keep an estimate of the velocity and direction of the wind at the height at which he is flying and to compute his dead reckoning position accordingly.

*Triangle of Velocities.*—The speed and direction of an aeroplane flying through the air, which itself is moving bodily in some direction, are given by the triangle of velocities.

Any velocity may be represented by a straight line with an arrow, by making the direction as shown by the arrow represent the direction of the motion, and by making the length of the line proportional to the speed. The resultant of two simultaneous velocities can then be found by starting from any point and drawing a line so that its length and direction represent one of the velocities, and from the end of this line drawing another line to represent the second velocity; the resultant velocity is found by closing the triangle in the reverse direction.

FROM P. V. H. WEEMS, "AIR NAVIGATION" (MCGRAW-HILL)

FIG. 2—TRIANGLE OF VELOCITIES SHOWING DEAD-RECKONING TERMS. THE ANGLE NWP IS THE HEADING; ANGLE NWP', THE TRACK; ANGLE NWW', THE WIND DIRECTION; ANGLE PWP', THE DRIFT ANGLE; LINE WP, THE AIR SPEED, LINE EP OR WP', THE GROUND SPEED; LINE EW OR PP', THE WIND SPEED

In fig. 2 let the line E→W represent a wind of 30 m.p.h. from the west; and let the line W→P represent the heading and air speed of an aeroplane flying southeast through the air at 70 m.p.h. These two velocities form two sides of the triangle EWP, starting from E to W for the wind direction and speed and going from W to P for the heading and air speed. The motion resulting from the combination of these two velocities can be represented by the line E→P, which closes the triangle in the reverse direction; in other words, E→P represents the track and ground speed. This triangle of velocities is of the utmost importance in all problems of dead reckoning, and it must be thoroughly understood.

In the chosen lettering: E = earth, W = wind, P = plane

For example, E→P indicates the speed and direction of the plane relative to the earth—in other words, the plane's track and ground speed; W→P represents the speed and direction of the plane relative to the air, which is the heading and air speed.

**Radio Navigation.**—Radio can be used in various ways as an aid to navigation. The more common of these navigational aids at mid-20th century were: (1) radio direction finders; (2) radio beacons; (3) low-frequency radio range stations; (4) radio location markers; (5) omnirange stations; (6) distance measuring equipment; (7) loran; (8) consol; (9) radar; and (10) instrument approach systems.

A *radio direction finder* is a radio receiver which uses a rotatable loop antenna. Since a loop antenna has directional characteristics, the direction of a transmitting station can be determined by observing the position of the loop when the minimum strength of signal is received. Radio direction finders may be installed at land stations or aboard ships and aircraft.

A *radio beacon* is a radio transmitting station which transmits a specified signal at regular intervals for use by radio direction-finding equipment.

A *low-frequency radio range station* is an installation consisting of two radio transmitters, one of which sends the letter "A" (. –) and the other sends the letter "N" (– .). The signals are keyed automatically and so timed that the sequence is interlocking; that is, the dot of the letter "A" fills the interval between the dash and dot of the letter "N," and the dash of the letter "A" fills the interval after the dot of the letter "N." The transmitted signals are controlled in such a manner that in four directions about the station the signal intensities are equal, which results in the reception of a steady tone. This is known as the "on-course" signal This signal is received in a sector about 3° in width and is commonly known as a radio beam.

*Radio location markers* are very-high-frequency radio transmitters located at radio range stations and on radio beams as position markers. The signals are transmitted in a narrow vertical pattern, and the markers on radio beams transmit a coded signal to provide identification of the beam. Their purpose is to provide pilots and navigators with positive check points on the airways and on the approaches to air terminals.

The *omnirange* is a very-high-frequency radio station that transmits a variable phase signal in all directions. With special receivers, a pilot can fly straight toward or away from this range on any of about 120 range legs, each about 3° in width. The low-frequency radio range system in the U.S. was being replaced by omniranges at mid-century.

*Distance measuring equipment* was developed for use in conjunction with omniranges. It is air-borne, and indicates to the pilot his distance in miles from an omnirange station where the DME transmitter also is located. In tests this equipment measured distances up to 100 mi. with an accuracy of about 98%.

*Loran* is a long-range navigational aid which was developed during World War II. Its accuracy compares favourably with that of celestial navigation, and its effective range for aircraft over water is about 700 nautical mi. by day and 1,400 nautical mi. by night.

The loran system consists of pairs of ground transmitters, an air-borne receiver-indicator, and specially prepared charts or tables for determining lines of position.

The pairs of loran transmitters are arranged in chains around the world, located primarily to cover heavily travelled ocean routes and coastal waters. Each pair consists of a master station

that transmits a pulsed signal which, after a fixed delay, triggers a slave station on exactly the same frequency.

The fundamental principles of loran are as follows: (1) pulsed radio signals are broadcast from a pair of transmitting stations in accurately known positions; (2) these signals are received visually on a specially designed receiver and one signal is superimposed on the other; (3) the difference in the time of arrival of these signals is measured on the indicator component of the receiver; (4) this measured time difference is used to locate the line of position of the observer on the loran chart; (5) the intersection of the lines of position obtained from two pairs of loran transmitters will give a loran fix and determine the position of the observer.

*Consol.*—Consol is the British name for an improved long-range radio navigational aid developed in Germany during World War II and known as Sonne.

In this system a specially designed transmitting station radiates a series of 60 dots and dashes that are interrupted by an equisignal which is directional to a fraction of a degree, except for two sectors of about 40° each, which are in line with the station antennae towers. These signals can be received with an ordinary low-frequency receiver.

By counting the dots and dashes heard on each side of the equisignal during a complete cycle of transmission, and referring this count to a chart with an overprint of consol lines or to consol tables, 12 lines of bearing will be indicated. The correct bearing can be obtained by applying the dead reckoning position or by taking a rough bearing with a direction finder.

Each station transmits an identifying signal and a steady signal for use by direction finding equipment as a part of each cycle. The time required to complete a cycle was originally two minutes; but the British station at Bushmills, North Ireland, was modified so that it could complete a cycle in 40 sec.

*Radar* (*q.v.*) was installed extensively in military aircraft and to a limited extent in commercial aircraft as a method of identifying landmarks at night and when flying in or above clouds. Radar also indicates the distance of an identified object from the observer. Its useful range, however, is limited to the line of sight distance.

Radar beacons were established at many points throughout the world at mid-century. These beacons operated only in conjunction with specially designed radar sets, and by their use the bearing and distance of the observer from the position of the beacon could be obtained.

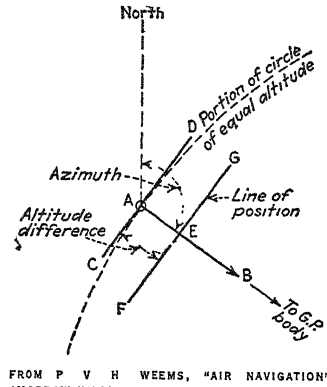
*Instrument Approach Systems.*—In the United States the Civil Aeronautics administration developed a system for landing approaches under instrument conditions, commonly known as ILS (instrument landing system). It consists of: (1) a localizer radio beam for guidance to the airport runway; (2) a glide path radio beam for guidance in correct descent; and (3) fan markers to fix position along the approach path.

During World War II another system was developed for instrument approaches. This system used a talk-down technique and became commonly known as GCA (ground controlled approach). Its principle was based on following the path of an aircraft on ground radar equipment; by means of radio communication the pilot is given information regarding his position relative to the desired glide path and is issued instructions for letdown procedures.

**Celestial Navigation.**—Celestial navigation is the method by which an observer's position on the earth is determined by means of calculations based upon celestial observations. The equipment required consists of a sextant for observing the altitude of celestial bodies, an accurate timepiece, a current air almanac and a set of tables for reducing the observations of time and altitude as required.

*Theory of Celestial Navigation.*—An observer at any point on the earth's surface, except the poles, sees the altitude of any heavenly body change with time. The altitude can be calculated for any instant of time by methods described below.

The altitude of a heavenly body also changes with a change in the position of the observer. The amount of this change depends on the direction in which the observer moves relative to the geographical position (G.P.) of the observed body. If he moves one mile directly toward the observed body, the altitude is increased by one minute; while if he moves in any other direction, the altitude is changed by a predictable amount.



The converse is also true; namely, if the altitude of a heavenly body is known, the distance from the geographical position of the body for the instant of observation is known. Celestial navigation is based on the application of this principle. Therefore, we may say that the work of the navigator in celestial navigation consists in finding his geographical co-ordinates of latitude and longitude by locating himself with reference to the geographical position of one or more celestial bodies.

The exact position of a body, in terms of declination and Greenwich hour angle, may be taken from the almanac for any instant of time, and this position may be plotted on a globe or chart as latitude and longitude. A circle with this position as centre, and with a radius equal to the observer's distance from this position as determined by the sextant (*i.e.*, 90° altitude), would be the observer's circle of position; the observer must lie somewhere on this circle called "circle of equal altitude." If two bodies were observed, the intersections of the circles of position would determine the position (or two possible positions) of the observer.

Since the circle of position as determined above would be very large, a small arc of the circle may be considered as a straight line, at some point on which is the observer's position If it were possible to lay off on a chart with sufficient accuracy the distance of the observer from the geographical position of the body, celestial navigation would be easy. The observer would doubtless use a sextant graduated to read zenith distance (instead of altitude) in minutes, or nautical miles, and this distance would simply be used as the radius of an arc to be laid off on a chart from the plotted position of the body. Unfortunately, the great distances—up to 5,400 mi.—to be plotted make this simple and obvious method impracticable, but the desired effect is secured by the means about to be described.

*The Line of Position.*—It is not usual to include the whole earth on any one chart; only that part of immediate interest to the navigator is shown. Hence, the whole circumference of circles of equal altitude would not appear; since the radius of the circle is usually large, the small, slightly curved arc in which the navigator is interested may be replaced by a straight line without appreciable error. This line is called a line of position, or position line, or Sumner line after Capt. Thomas H. Sumner, a U.S. shipmaster, who discovered it in 1837.

*Plotting a Position Line on a Chart.*—To lay down a line of position on a chart by the method of Marcq St. Hilaire, it is necessary to take the dead reckoning position, or some convenient point close to it, and to compute for this assumed position the altitude and azimuth of the observed body at the time at which the observation was made. If the altitude observed with the sextant agrees exactly with the computed altitude, the altitude difference is zero. Then it is necessary only to draw from the assumed position A (fig. 3) a line of bearing AB along the computed azimuth of the body and a line CAD at right angles to this; then CAD is the required line of position.

FROM P V H WEEMS, "AIR NAVIGATION" (MCGRAW-HILL)

FIG 3.—PLOTTING ALTITUDE DIFFERENCE AND LINE OF POSITION

If, however, the observed altitude is greater than the computed altitude, say by 15 min. which equals 15 nautical mi. on the earth's surface, the observer is nearer to the geographical position of the heavenly body than the assumed dead reckoning position would indicate. In this case, the position line must be moved closer to the geographical position of the heavenly body by the amount of the altitude difference. Hence, the intercept AE is

*Airport Size Planning Standards*

| [illegible] | Class 1 | Class 2 | Class 3 | Class 4 |
|---|---|---|---|---|

*All of the above landing-strip and runway lengths are based on sea-level conditions; for higher altitudes increases are necessary One surfaced runway is recommended for the effective length of each landing strip for airports in classes 2, 3, and 4.
†Landing strips and runways should be sufficient in number to permit take-offs and landings to be made within 22½° of the true wind direction for the percentage shown above [illegible] per hour and higher, based on at least a ten-year weather bureau wind record where possible [illegible] wind conditions of three miles per hour and lower.

administration classifies airports in the United States with the length of the longest runway or landing area, at sea level, as the major consideration, as follows:

| Class | Runway length |
|---|---|
| Sub 1 | Less than 1,800 ft. |
| 1 | 1,800–2,700 |
| 2 | 2,700–3,700 |
| 3 | 3,700–4,700 |
| 4 | 4,700–5,700 |
| 5 | 5,700–6,700 |
| 6 | 6,700–7,700 |
| 7 | 7,700–8,700 |
| 8 | 8,700–9,700 |
| 9 | 9,700 and up |

These lengths should be increased by 7% for each 1,000 ft. of elevation above sea level and further increased by 5% for each degree that the mean temperature of the hottest month of the year, averaged over a period of years, exceeds the standard temperature.

Broken down by class the total of 6,484 airports in the United States on Jan. 1, 1950, was as follows:

| Class | Airports |
|---|---|
| Sub 1 and 1 | 4,100 |
| 2 | 1,027 |
| 3 | 576 |
| 4 | 447 |
| 5 | 185 |
| 6 and up | 149 |

All runway lengths referred to in the classifications below and set forth in the accompanying table apply to airports located at sea level. For those appreciably above sea level, the minimum length of landing strip for each class must be increased enough to compensate for the decrease of density with altitudes. Thus, an airport 6,000 ft. above sea level needs in general a runway length almost 50% greater than would be needed for a field of the same class near to sea level.

*Class 1 Airport.*—Small communities having a population up to 5,000 which are not located either on the present or proposed air-carrier system should provide airports which can safely accommodate aircraft of the small private-owner type. It is recommended that under sea-level conditions the airport should be equipped with landing strips having a minimum length of 1,800 ft. to 2,700 ft. together with "clear approaches." (For additional data *see* the table.)

*Class 2 Airport.*—In larger communities having a general population range of from 5,000 to 25,000, located on present or proposed feeder lines where considerable aeronautical activity is present, the airport should safely accommodate the larger-sized, private-owner-type planes and small-sized transport planes For such airports it is recommended that under sea-level conditions they provide landing strips of at least 2,700 ft. to 3,700 ft. in length, together with "clear approaches." (For additional data *see* the table.)

*Class 3 Airport.*—Important cities having a general population range of from 25,000 to several hundred thousand, located on feeder lines or serving as intermediate points on main-line routes, should provide airports which can safely accommodate the present-day transport planes. To do this such airports under sea-level conditions should provide landing strips 3,700 ft. to 4,700 ft. in length together with clear and unobstructed approaches. (For additional data *see* the table.)

*Class 4 Airport.*—Cities representing the major industrial centres of the nation and serving as the most important junction points or terminals on the airway system should provide airports which can safely accommodate the largest aircraft in use and those planned for the immediate future. Such airports under sea-level conditions should provide landing strips 4,700 ft. and more, together with clear approaches. (For additional data *see* the table.)

The Civil Aeronautics administration estimated in Sept. 1945 that a total of $1,027,159,417 had been expended on civil airports through July 1, 1945. Of this total, $740,705,171 was in federal funds, $10,155,266 in state funds, $192,950,000 in municipal funds and $83,348,980 in commercial and private funds.

On May 13, 1946, the congress of the United States passed the Federal Airport act, which authorized the expenditure of $500,000,000 in federal funds over a seven-year period for the construction and improvement of airports in the United States and its possessions. The act designated the Civil Aeronautics administration to administer the provisions of the bill (public law 377). The act specified that federal funds would be appropriated on a yearly basis for seven years and would not exceed $100,000,000 in any one year, and that federal funds would be matched by subunits of government-sponsoring projects.

As of Feb. 1, 1950, local and state project sponsors at 726 locations had received grants of $98,100,000 in federal funds and had matched those funds with their own money.

**Planning an Airport.**—The first step and one of primary importance in planning an airport is the determination of the type and extent of activities the airport ultimately will serve, even though only partial development is to be undertaken initially. Anticipated future expansion of facilities and activities based on available data and estimates should be included in the original planning. In this respect acquisition of sufficient land to allow for orderly expansion and development is of vital

importance. Other considerations to be taken into account in the planning stage are the estimated number of passengers and cargo transport movements that may be expected at ultimate development, the number and type of aircraft likely to be based at the field, the extent of training activities and the volume of business resulting from sales and service at the proposed airport

To obtain a correlation between the design of airports and the design of aircraft to be used in air-carrier operations the Civil Aeronautics administration developed technical standard order-N6A, which as amended on Oct. 4, 1948, has the purpose of: (1) guiding employees of the CAA regarding approvals and recommendations for runway design; (2) indicating to sponsors of airport development projects the runway characteristics to which federal funds will be applied; and (3) indicating to manufacturers and operators of transport-type aeroplanes the airport runways that will be available

The standards outlined in TSO-N6A for air-carrier service are as follows:

| Service | Runway (feet) | | Taxiway (feet) | Landing Strip (feet) | Pavement Loading (per wheel in pounds) | |
|---|---|---|---|---|---|---|
| | Length | Width | Width | Width | Single wheel | Dual wheel |
| Feeder . . . | 3,500 | 100 | 40 | 300 | 15,000 | 20,000 |
| Trunk line . . . | 4,200 | 150 | 50 | 400 | 30,000 | 40,000 |
| Express . . . | 5,000 | 150 | 60 | 500 | 45,000 | 60,000 |
| Continental . | 5,900 | 150 | 75 | 500 | 60,000 | 80,000 |
| Intercontinental | 7,000 | 200 | 75 | 500 | 75,000 | 100,000 |
| Intercontinental express . | 8,400 | 200 | 100 | 500 | 100,000 | 125,000 |

The types of service in TSO-N6A are defined in the following manner:

Feeder: Airports for feeder-type service.
Trunk line Airports to serve on air-line trunk routes
Express: Airports at large cities or important junction points on trunk routes.
Continental Airports serving long nonstop continental flights.
Intercontinental Airports serving [illegible] or transoceanic flights.
Intercontinental express: Airports serving transoceanic flights of largest types of aircraft.

**Locating the Airport.**—The selection of a site for an airport is of tremendous importance and an extremely difficult task resulting from the variety of vital factors that must be considered. In most instances the final selection of a site is determined by compromise after a consideration of all elements On one hand an airport must be conveniently located to the community it is to serve since airports are almost entirely dependent on public use for financial success. Important considerations here are public transportation and travel distance. On the other hand the physical features of the terrain under consideration are of great importance with regard to construction costs and the safe operation of the airport when it has been developed. In general, an elevated location is best suited for the location of an airport because of fewer obstructions along the approaches to the field, better natural drainage, less fog and more uniform winds. Valley sites have the advantage of requiring less grading and are most easily accessible to ground transportation and public utilities

**Airport Approach Protection.**—Obstructions in the approach zones of an airport may restrict its use to certain types of operations and in some cases cause abandonment of an otherwise well-designed airport. To avoid such situations airport sites should be so selected that the approaches to the runways are free from obstructions such as power lines, smokestacks, tall buildings or radio towers. Before final selection the practicability of removing or reducing all obstructions to a safe height should be assured.

The following horizontal and vertical approach standards are recommended for obstruction clearance:

50-to-1 for runways to be used in instrument approaches.
40-to-1 for other runways to be used for scheduled air-carrier operations or by similar aircraft in nonscheduled operations
20-to-1 for all runways or landing strips to be used exclusively by smaller aircraft

For example, if an obstruction is 10 ft. high 700 ft. from the end of the runway, it would fall beneath the normal minimum flight path of an aircraft taking off or making a landing.

**Wind Data.**—Wind direction is a vital factor in the selection of an airport site and the layout of the runways since aircraft take off and land into the wind. Determination of the direction of prevailing winds is made by an analysis of weather reports in the area covering at least ten years.

Runways should be oriented so that aircraft may be landed at least 95% of the time with cross winds not exceeding 15 m.p.h. Usually, 95% wind coverage with cross-wind components not exceeding 15 m.p.h will provide 98% to 100% coverage with less than 30 m.p.h. cross-wind components. Since almost all airports will serve light aircraft as well as transport types the wind data should be analyzed on the basis of the 15-mi. cross-wind component.

**Drainage and Soil.**—One of the most important considerations governing the location and selection of an airport site is the nature and composition of the soil and subsoil upon which it is to be built. For the economical development of the area for aviation purposes, and especially for the life and durability of paved runways, taxi strips and aprons detailed knowledge of the soil at the site, and especially [illegible] in contact with water, is vitally important.

Adequate drainage is especially essential to the proper maintenance of paved runways, for experience shows that more runway paving failures occur from unstable subsoil conditions caused by lack of proper drainage than for any other reason.

**Grading.**—In view of the fact that one of the few permanent features involved in the construction of an airport is the grading, a complete grading plan of the entire area ultimately to be included in the airport should be prepared, which will take into consideration the contemplated finished grades Since excessive grades, particularly, make night landings more difficult, longitudinal and transverse landing areas in runway grades not to exceed 1½% are preferable on major airports. Obviously, however, it is not always feasible to adhere to this figure as a maximum, since wide topographical variations on a site often involve excessive quantities of earth movement. From the standpoint of aircraft operations alone, however, field grades should be held as close to 1½% as possible.

**Airport Surfaces.**—In sections of the country where the soil and climatic conditions permit the growth and maintenance of firm turf surfaces, it may be possible for airports with light and limited traffic to maintain continuous operations throughout all seasons of the year without resorting to artificial surfacing. However, under the strain of heavy traffic, turf is likely to become rutted, especially if exposed to alternate freezing and thawing.

*Paved Runways*—The term "runway paving" is applied to the process of preparing a firm, stable, all-year, all-weather runway surface, free from dust or aggregate which may be blown or picked up by aircraft engine propellers, and designed to support the static and dynamic loads occurring in the landing and taking off of aircraft.

Hard surfacing may be divided roughly into two general types: rigid and flexible. Rigid-type pavement include portland-cement concrete of varying dimensions, with or without steel reinforcing, and certain asphaltic concretes and asphaltic or water-bound macadams which may approach rigid characteristics. Flexible paving includes virtually all of the bituminous types of construction with cutbacks, emulsions, planed or blade mixes, built-up penetrations and bituminous soil stabilization.

Rough nonskid wearing surfaces are avoided because of the excessive tire wear which such surfaces impose on landing aircraft. The preferable finishes for concrete surfaces are those approaching a smooth trowelled finish

Lighting.—Airports vary so widely that each airport will

present a separate problem. The size and shape of an airport, the terrain, the amount of traffic, the types of aircraft to be used and the nature of the soil or runway surface all will play important parts in affecting the number, type and extent of the lights which should be used. The following types of lights are, however, considered standard equipment on all major air terminals in the U.S :

*Airport Beacon.*—This is a double-ended light projector emitting two lights, one green and one white, from opposite ends. This light rotates at six revolutions per minute and tells the pilot there is a lighted field available. Beacons are generally mounted on towers set either on the ground or on top of airport buildings. In any case, the beacon should be mounted at least 20 ft. above any buildings or surrounding structures.

*Illuminated Wind-Direction Indicator.*—Two basic types of illuminated wind-direction indicators are in general use: the illuminated wind cone and the illuminated wind tee Their primary function is to give the true direction of the wind at all times. They should also be readily visible at all times to aircraft approaching from any direction

*Runway Lights*—Runway lights are used on major air terminals to assist pilots in effecting landings and take-offs They consist of white lights slightly elevated from the ground along the runways, spaced 200 ft apart along each side of the runway. Their installation is always arranged in pairs opposite one another on both sides of the runway. They are controlled so that only one runway at a time may be illuminated.

On instrument runways the lights on the last 1,500 ft. of the runway are half yellow and half white so that they show yellow when viewed from the approach end of the runway. This marks a yellow caution zone warning the pilot he has left only 1,500 ft. of runway on which to come to a stop or to pull up and make another approach.

Across the ends of the runways are placed green threshold lights which define the ends of the runways.

*Approach Lights.*—Approach lights are lights located outside the landable area and arranged to indicate a favourable or preferred direction of approach. The principal use of approach lights is to mark a lead-in or approach lane for instrument landing.

*Obstruction Lights.*—Obstruction lights clearly mark with red lights all obstructions surrounding an airport. High obstructions like radio towers which extend more than 70 ft. above their surroundings are marked by lights at the top and at the one-third and two-third levels.

*Air Marking.*—The air marker is one of the simplest and least expensive aids to air navigation in common use in the United States, but it is, at the same time, most effective and necessary, particularly in so far as the private or itinerant flyer is concerned. Perhaps the chief hazard concerned in "contact flying" is the danger of becoming lost because of poor visibility or other reasons and it is obvious that this hazard is considerably lessened if the flyer can ascertain his exact whereabouts and orient himself by merely looking down as he passes over a town or city and reading a sign giving this information. Since this is the chief function of air marking, the markers should be of a letter size 10 to 20 ft., and legible under good visibility conditions from a height of at least 3,000 ft. Such markers are either painted or constructed on roofs, on the ground or painted directly on highways.

**Seaplane Bases.**—The word airport has been used for convenience to describe bases for land planes alone. Airports less narrowly defined and seaplane bases should, however, be considered together since they provide essentially the same purpose. The limiting dimensions of a landing area for seaplanes are customarily determined by natural conditions. Open-sea take-offs are usually dangerous and frequently impossible and the greatest possible length of operating area is usually fixed by the width or depth of a harbour except where the whole body of water (lake, river, sound or bay) is so protected as not to become very rough. In an ideal seaplane base adequate rules governing the use of channels and the mooring of craft would leave several straight runways of adequate length clear of any fixed obstructions or any great congestion of water traffic

**Major Air Terminals.**—While there are a number of major air terminals scattered throughout the United States, only one has been selected to illustrate the development and growth and the requirements which must be met by a modern major air terminal.

Washington National airport, Washington, D.C. is the only federally owned and operated airport in the United States, being under the jurisdiction of the Civil Aeronautics administration Approximately 4 mi. S of Washington on a bend of the Potomac river, the airport is modern in every detail. All the latest safety devices for air navigation may be found there The terminal building is streamlined for efficient handling of passengers, cargo, mail and freight Construction work started on the field on Dec 1, 1938, and the field was dedicated on June 14, 1941 The field covers 730 ac., of which 450 ac. comprise the landing area

Washington National airport has four asphalt-paved runways as follows.

| | | | |
|---|---|---|---|
| North–South | 6,855 ft | long by 200 ft | wide |
| North–West | 5,210 ft | long by 200 ft | wide |
| North–East | 4,895 ft | long by 150 ft | wide |
| East–West | 4,100 ft. | long by 150 ft | wide |

All the runways have unobstructed approaches Of the eight approaches to the field, six are over water while only two are over land. The Potomac river bounds the field on three sides.

The airport was raised out of a series of mud flats along the Potomac river by the corps of engineers, U.S. army. In the construction of the landing area from the mud flats 19,500,000 cu yd. of material were pumped from the river bottom to fill and reclaim 325 ac. from the marshes.

The design of the terminal building follows Southern Colonial lines in keeping with the architecture and landscaping of the nation's capital The terminal building has 111,000 sq ft. of space and houses besides the CAA administrative offices, the control tower, restaurants, barbershops and other concessions and also air line offices and ticket counters. The main lobby, glass enclosed on the runway side, is flanked by two promenade decks for use by visitors and sight-seeing parties. Twelve large hangars flank the administration building to serve the nine air lines serving the field In the rear of the administration building is the parking area capable of handling 5,000 cars.

The control tower, atop the administration building, houses the latest in radio and radar equipment. For landings under bad weather conditions the pilot has a choice of two devices to be guided down through the overcast. In many instances the pilot using one system is monitored for greater safety by the other system. There is the instrument landing system, based on radio principles, which allows the pilot to fly down an invisible path by watching a needle on his instrument panel. Precision beam radar or ground controlled approach, using radar principles, is also used; the pilot is "talked down" by personnel on the ground who watch the progress of the aircraft on the radar scanning screen Surveillance radar in use at the field enables tower personnel to see and locate all aircraft within a 30-mi. radius of the airport as an aid to the proper separation of traffic. The field has the most modern of runway and approach lights.

The net direct bookkeeping cost of the airport was $9,889,043. Four government agencies took part in the planning and construction. Actual construction was done by the U.S. army engineers while the Civil Aeronautics administration, Public Buildings administration and Public Roads administration were involved in the planning The Works Progress administration and the Public Works administration also participated but no charges were made for the services of these agencies since they involved relief labour.

**Airports in Europe.**—It is the general rule in Europe that the major airports serving international air traffic are financed and operated by the central government. This is true, however, to a lesser degree in Great Britain, where the trend follows that of the United States in providing municipally owned and operated

airports.

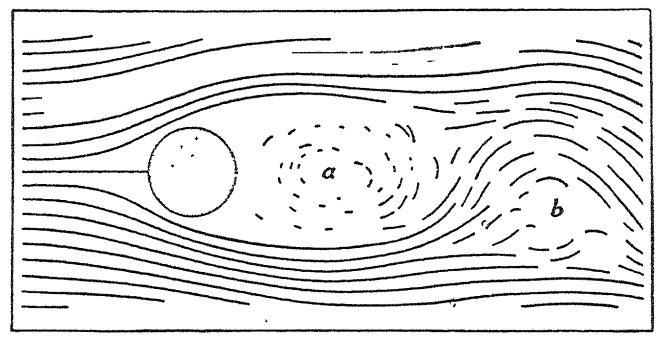
Detailed information on all types of airports in Europe was sketchy after World War II; however, most countries have followed the prewar trend in providing large and well-made terminals for international travel

In Great Britain alone there were 25 airports of entry as of Jan. 1, 1950, while Germany had 9; Italy, 8; France, 9; and Belgium, 6

London airport, located 12 mi. W. of Westminster bridge, boasts a 9,000-ft runway along with one 6,000 ft. and one 5,700 ft., all having a 300-ft. width. Modern in every respect, the London airport has instrument landing system and ground controlled approach for instrument weather operations, high intensity approach and runway lights, a weather station and control tower. Airports at Bovington, Blackbushe, Hurn, Prestwick and the royal air force Valley and Manston fields also serve London as alternates in bad weather.

In Germany, Tempelhof field, Berlin, partially destroyed during World War II, was again in 1950 in commercial operation, serving not only the military but scheduled air lines. The longest paved runway at Tempelhof is 5,300 ft. Tempelhof serves as an airport of entry for Germany along with Gatow field, Berlin, Bremen, Cologne, Düsseldorf, Rheim Main at Frankfort, Hamburg, Munich and Stuttgart.

Paris is served by two fields, Le Bourget and Orly, both operating as airports of entry. Orly has three concrete runways, the longest being 6,630 ft. by 197 ft. Le Bourget also has three concrete runways, the longest being 6,900 ft. in length by 197 ft. in width (Ho. Bm.)



**AERODYNAMICS.** The word aerodynamics is applied both to the study of the disturbances generated in air by the passage of solid bodies, such as aircraft, and to the study of the motion of free aircraft under the influence of air reactions. The former is a specialized development of *fluid dynamics* and the latter of *rigid dynamics, i.e.,* the dynamics of rigid bodies under the action of external forces. (*See* DYNAMICS and HYDRODYNAMICS)

The equations of motion of a slightly viscous fluid such as air can be formulated, but have not in general been solved, and in no instance has the complete motion of the air passing a body, such as a wing, been calculated directly from the laws of motion. Aeronautics is thus dependent for its data mainly upon direct experiment, and since quantitative experiments upon the full scale are difficult and costly, the bulk of the data available has been obtained upon small models of the parts concerned suspended in artificially induced currents of air. The technique of the measurement of air reactions upon models suspended in "wind tunnels," (*see* AERONAUTICS) as the tunnels containing these air currents are called, has reached a high development and many tunnels of great size and power have been built in all countries seriously concerned with aeronautics. The largest wind tunnel in the world is at Langley Field, Virginia; it has a cross section of 30 feet by 60 feet and is operated by two fans 35 feet 5 inches in diameter, driven by a 4,000 horse power slip-ring induction motor. The tunnel can accommodate a moderate sized aeroplane, one, for example, that would carry two or three passengers. New tunnels in England and Germany approach the size of the one at Langley Field.

It is clearly of importance to determine how nearly similar is the manner in which the air flows around such models to the manner in which it flows around the corresponding full scale aeroplane. In many aeronautical problems air can be treated as though it were an incompressible and inviscid fluid. In these cases it can be shown that *similar bodies moving in a similar manner will generate similar air flows,* no matter what the size of the body, the density of the fluid, or the speed of the motion Even the nature of the fluid, whether liquid or gas, is of no consequence, and experiments intended to relate to air may equally well be carried out in water, or in any other fluid which, for the purpose in hand, can be treated as incompressible and inviscid. The simple laws of aeronautics, such as that the pressure varies in proportion to the density of the air and to the square of the speed, are based upon this assumption.

**Effects of Compressibility and Viscosity.**—In aeronautics air can generally be treated as though it were incompressible, unless velocities exceeding some 300 or 400 miles per hour are involved When velocities higher than this occur, compressions and expansions of the air as it passes the solid body may seriously influence the flow, the rule for similarity of flow becomes less simple. It is then necessary that corresponding velocities in the motions to be compared should all bear the same ratio to the velocity of sound in the fluid in which the motion takes place. For example, if high speed experiments in air and water are to be strictly comparable, the experiments in water must be carried out at speeds four times as great as the corresponding speeds in air, because sound travels some four times as fast in water as in air, but when both the model and the full scale body move through air the actual speed of the model must be the same as that of the full scale body Such high speeds as 300 to 400 miles per hour are not yet commonly met in aeronautics, except in racing aeroplanes and at the tips of the blades of high speed airscrews, and hence it is unnecessary to obey this law of similarity, except in connection with the tests of such screws.

For fluid flows which are appreciably influenced by viscosity yet another condition must be fulfilled to ensure similarity between two motions. Let $\mu$ be the viscosity of the fluid, $\rho$ its density, $V$ the velocity of the body through the fluid, and let $l$ be some length which defines the size of the body—for instance the diameter, if the body be a sphere, or the length, if it be an airship. Then the quantity $\frac{\rho V l}{\mu}$ must have the same value in each of the motions to be compared, otherwise viscosity will play a different part in each motion, and strict similarity will be impossible. This quantity $\frac{\rho V l}{\mu}$ has zero dimensions and is therefore a pure number or ratio, independent of the units in which its separate factors are expressed, provided that those units form a dynamically consistent

FROM NAYLER AND FRAZER, "REPORTS AND MEMORANDA OF THE ADVISORY COMMITTEE FOR AERONAUTICS" BY PERMISSION OF THE CONTROLLER OF H M STATIONERY OFFICE

FIG. 1.—THE TURBULENT FLOW OF FLUID PAST A CYLINDER

This illustrates the flow round all bodies which offer a high resistance to rapid motion through fluids. The motion of the fluid, which is from left to right, is characterized by a dead region *a*, followed by a turbulent wake *b*. Such a flow exerts a powerful drag upon the body

system, *i.e.,* a system of units which allows Newton's laws of motion to be expressed in the form:—Force = mass × acceleration, the pound-poundal-foot-second and the gram-dyne-centimetre-second systems being examples. It is universally known as the *Reynolds number,* after the celebrated scientist Osborne Reynolds. When the Reynolds number of a flow is small, viscosity will play a predominating part in the motion, which will be of the kind usually associated with the flow of oils or treacle. When the number is large, the flow will be of the kind usually associated with water, and will approximate to that of an inviscid fluid Thus the same fluid may act in a highly viscous manner when flowing slowly past small objects, and yet behave almost as though inviscid when flowing rapidly past large bodies. The Reynolds numbers which are of interest in aeronautics are of the order of a million; in these circumstances the air behaves almost as though it were inviscid, and the simple laws of comparison between model and full scale, to which reference has been made, can generally be applied without serious error. Certain flows, which are of great

interest in aeronautics (*e g*, the flow about a wing at the stalling angle which is defined later) are, however, highly critical, in the sense that small disturbances may cause an entire change in the type of flow. These critical flows may be sensitive to changes in the Reynolds number, even though the value of the number is very large, and hence the greatest caution must be used in applying the results of small model experiments on these critical phenomena. The highly practical importance of some of these critical flows has led to great efforts being made to devise laboratory experiments in which the Reynolds number will be the same as that of the full scale flow to be represented One way in which this has been successfully accomplished, though at great cost, is to enclose the whole wind tunnel in an air-tight chamber pumped up to a pressure of some 20 atmospheres, this increases $\rho$ some 20 times, which compensates for the reduction in $V$ and $l$ necessary to bring the experiment within the scope of laboratory methods.

## FLUID MOTION

The forms taken by the flow of air past a solid body can in general be classified as belonging to one of two characteristic types. Fig. 1 is typical of the flow around the majority of bodies not specially shaped to move easily through fluids. The motion, which in this figure is from left to right, is characterized by a dead region *a*, of small velocity and low pressure, followed by a turbulent wake *b* Such a flow exerts a powerful drag upon the body, and much energy will be required to force the body rapidly through the fluid. Fig. 2 is typical of the flow around bodies which move easily through fluids, the dead region *a* is absent, whilst the wake has become very small. Flows of this type are generally called *streamline* flows, and bodies which generate them are called streamline bodies. The turbulent flow, as in fig 1, is not yet susceptible to precise mathematical analysis, but streamline flows, as in fig. 2, approximate, when the Reynolds number is large, to the flow of a hypothetical inviscid fluid, the analysis of which has been thoroughly studied.

**Bernoulli's Theorem.**—This famous theorem relates to the steady flow of the hypothetical inviscid fluid, and states that the pressure $p$ and the velocity $v$ at all points on a single streamline are connected by the relation:

$$p+\tfrac{1}{2}\rho v^2=\text{constant.}$$

In most aeronautical problems the air at all points far from the body is assumed to be undisturbed, so that its velocity relative to the body and its pressure are uniform, if these are called $V$ and $P$ respectively, then Bernoulli's equation leads easily to:

$$p-P=\tfrac{1}{2}\rho V^2\left[1-\left(\frac{v}{V}\right)^2\right]$$

from which the pressure at any point can be deduced from the velocity at that point, or vice versa The maximum pressure will thus occur where $v$ is zero, and will have the value of $P+\frac{1}{2}\rho V^2$; this maximum pressure occurs on the surface of the solid body at the point where the streamlines divide. (*See* figs. 1 and 2 ) This fact is used to measure the velocity of air in aeronautical experiments. If a tube, closed at one end and open at the other, is placed with the open end facing the air stream, the pressure within it will have the maximum value $P+\frac{1}{2}\rho V^2$. If the difference between this pressure and the pressure $P$ of the undisturbed stream can be measured and if the density is known, the velocity $V$ can be determined. The undisturbed, or static pressure $P$ can be obtained within a closed tube placed with its axis parallel to the wind and having small holes punctured in its sides at some distance from the closed end. These two tubes are known respectively as the *pitot* and *static pressure* tubes; and together with some form of manometer, for measuring the difference between the pressures within them, they provide the standard speed measuring unit both in the laboratory and on aeroplanes in flight.

**The Flow About a Streamline Body.**—The theoretical study of a hypothetical inviscid fluid leads to the conclusion that when a solid body starts from rest to move through such a fluid, which is otherwise undisturbed, the form of the flow around the body is uniquely determined by its shape and mode of motion. This

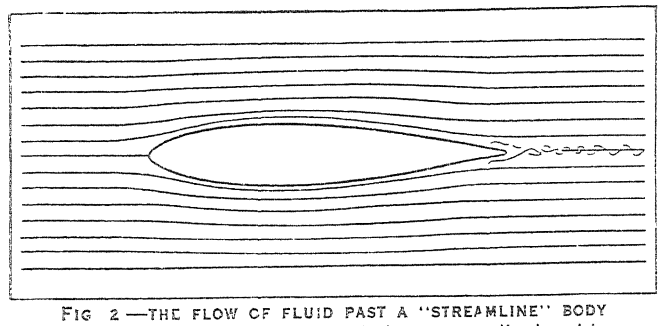


FIG 2.—THE FLOW OF FLUID PAST A "STREAMLINE" BODY
In contrast to the turbulent flow round a body not especially shaped to move easily through fluids as in Fig. 1, this illustrates the flow round a body which offers small resistance to rapid motion through fluids

flow has the remarkable property that, although it may cause variations of pressure which tend to rotate the body, it exerts no resultant force upon the body, no matter what the shape of the body may be. The actual air flow about a streamline body, such as an airship (fig. 2) is a very close approximation to this theoretical flow, and hence the resultant of the pressures upon the surface of the body is almost zero—the small remaining drag, or resistance to motion, being nearly all due to *skin friction*, *i e*, the tangential forces on the surface due to the friction of the air. When the Reynolds number is large, as in aeronautics, the fluid mechanism which exerts these skin friction forces is confined to a very thin sheath, or layer, enveloping the body. This is called the *boundary layer;* the motions within it are very complex and are known to provide the determining factor which decides whether the flow will be streamline or turbulent. Outside this very thin boundary layer the flow, if streamline, behaves very closely as though the fluid were absolutely inviscid.

A wing may be loosely described as a flattened streamline body Its cross section in one plane containing the direction of motion has a typical streamline form, as in fig. 3 (*see* also AEROPLANE) which shows a modern wing section. So long as the incidence, or inclination of this section to the direction of motion is not too great, the flow about the wing will be streamline, the drag will be small and the wing will exert a lift perpendicular to the direction of motion which increases progressively with the incidence. If the incidence becomes too large the flow changes, more or less

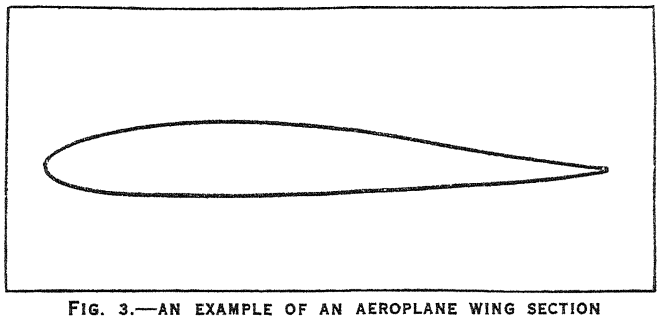

FIG. 3.—AN EXAMPLE OF AN AEROPLANE WING SECTION
The modern type of wing is more or less a flattened streamlined body. The actual air flow about a body of this shape is such a close approximation to the theoretical flow that the pressure upon its surfaces is almost zero

suddenly, to a form similar to that in fig. 1. The wing is then said to *stall* and its resistance to motion is greatly increased, whilst its lift no longer increases with incidence, but may even fall slightly.

Below the *stalling angle* the flow, though streamline, differs from that unique flow which could be generated from rest in an inviscid fluid, and approximates more nearly to one of a series of flows, which are possible to the inviscid fluid, but which could not be generated in it without the action of some additional agency. The way in which these flows are generated is still somewhat obscure, but it is known that their development is made possible by the slight trace of viscosity in the air, which allows eddies to be shed from the trailing edge of the wing, and that as these eddies are shed the flow about the wing changes until the appropriate flow has developed. When these changes have ceased and the flow has become steady the viscosity plays no further appreciable part in the motion, except in the boundary layer. Theoretically

there are, for each wing at each incidence, a series of such flows which could exist steadily in the inviscid fluid but could not be generated in it, and a question arises as to which one of them will occur in any given instance. Unlike the flows which could arise from rest in an inviscid fluid, these flows give theoretically, a lift upon the wing, and if the actual lift of the wing can be measured, the particular flow of this series which is occurring can be identified as that one which theoretically gives the measured lift. It is thus possible, by merely measuring the total lift of a wing, to calculate, with considerable accuracy, the direction and velocity of the flow at all points in its neighbourhood and from Bernoulli's equation the distribution of pressure over its surface. If the lift cannot be measured, the flow can be approximately identified as that one of the series in which the streams flow smoothly off the trailing edge of the wing without sharp changes of direction. This method of identification is not so accurate as the former.

**Induced Drag.**—Calculations such as the foregoing can most conveniently be made in relation to wings of infinite span, or length perpendicular to the direction of motion. For such wings the theoretical drag in the inviscid fluid is zero; the real drag is almost entirely due to skin friction and is so small that it may, in favourable circumstances, be less than one-fiftieth of the lift. When the span of the wing is finite, circulations are set up around the tips, the air flowing round them from the high pressure region beneath to the low pressure region above the wing. Vortices are thus generated, which trail from the wing tips and remain in the air long after the wing has passed. These vortices require power for their generation and consequently the power required per running foot to propel a finite wing, and the drag on the wing, are greater than for a wing of infinite span: for this reason the drag of a wing of practicable shape is seldom less than one-twentieth of the lift. L. Prandtl has developed approximate mathematical methods of calculating this drag, which he calls the *induced* drag. The difference between the actual and the induced drag is called the *profile* drag, because it depends upon the profile, or cross section, of the wing and is not dependent on the span.

For a given wing arrangement, the induced drag is proportional to the ratio, weight supported/span; this ratio is now called the *span loading*. The induced drag varies in *inverse* proportion to the air density and the square of the speed. The profile drag, for a given incidence and profile, depends upon the total wing area and varies in *direct* proportion to the density and the square of the speed. When calculating the drag of an aeroplane wing, it is now normal practice to divide the drag into these two parts and to study them separately. Induced drag can be calculated, not only for single wings, but for multiple wings, as in a biplane, or for wings in the presence of plane boundaries, such as the walls of a wind tunnel or the surface of the earth. Such calculations are used extensively in all modern laboratories and design offices.

## FREE FLIGHT

**Stability.**—An aeroplane which, on being disturbed from a condition of steady flight in equilibrium, ultimately returns to the condition from which it was disturbed, is said to be *stable*. Complete stability in this sense can be achieved by correct proportioning of the parts of the aeroplane, but is by no means necessary for successful flight; for if the pilot has effective control over his aeroplane he can easily check any tendency to depart from equilibrium flight, which may result from a moderate instability. It is, however, important for the designer to know, not only whether his aeroplane will be stable or unstable, but the degree of stability or instability to be expected, for its behaviour in the hands of the pilot will depend upon this factor. The subject has therefore been extensively studied mathematically, but is so complicated that it is impossible here to do more than refer the reader to standard books on the subject.

**Stalling.**—As the speed of an aeroplane falls the lift falls, and sufficient lift to balance the weight can be obtained only by an increase of incidence. But it has been shown in a previous paragraph that when the incidence of a wing passes a certain critical angle the character of the air flow changes, and the lift ceases to increase. There is thus a minimum speed, associated with the above critical angle, at which any aeroplane can fly steadily. This minimum speed of steady flight is called the *stalling speed*, the incidence at which it occurs is called the *stalling incidence*, and an aeroplane flying at an incidence greater than the stalling incidence is said to be flying *stalled*. With this change of flow at the stalling incidence is associated a complete change in the characteristics which determine the stability of aeroplanes and the action of their controls. For the effect of this change upon practical aviation *see* AEROPLANE.

**AERO ENGINES.** The purpose of the aero engine is to provide propulsive thrust, either by driving a propeller or by high-speed jet reaction. Any suitable power source might be used, but the internal-combustion piston engine and gas turbine predominate because of their low weight and bulk. The gas turbine may be designed to drive a propeller (turboprop) or as a jet propulsion engine (turbojet). Less common internal-combustion types are the ramjet, pulsejet and rocket engines.

## HISTORY

The earliest aero engines were adaptations of existing power units and they achieved some success in powering slow-speed, lighter-than-air craft. In earlier experiments with heavier-than-air craft, the lack of a lightweight engine was a great handicap and no real progress was made until engines were designed specially for aeroplanes.

In 1851 a Frenchman, Henri Giffard, built the first aero engine. It was a steam engine which, with its boiler, weighed 351 lb. and developed only 3 horsepower. Nevertheless, it made possible the first controlled navigation of the air on Sept. 4, 1852, when Giffard piloted his airship from Paris to Trappes. The first internal-combustion engine was flown in 1872 when a German, Paul Haenlein, piloted an airship powered by a four-cylinder piston engine using coal gas fuel. Gasoline fuel was first used in a two-cylinder piston engine used by David Schwarz to propel the first rigid airship in 1897.

**Early Aeroplane Engines.**—The engine used by Orville and Wilbur Wright in the first free flight of an aeroplane on Dec. 17, 1903, was designed and built by them and delivered 12 h.p. for 179 lb. weight. In form it was similar to contemporary automobile piston engines, having four cylinders in-line, with water cooled barrels and air-cooled heads.

In the same year, Charles M. Manly designed and built a noteworthy engine for the ill-fated S. P. Langley "Aerodrome." Manly's engine developed 52 h.p. for 151 lb. weight. Its weight/power ratio of 2.88 lb. per horsepower was remarkably low at that time and compared favourably with the weight/power ratio of similar power engines of much later date. Its five water-cooled cylinders were arranged radially around its crankcase, a form of construction which was maintained throughout the years in the popular air-cooled radial piston engine.

**Engines of World War I.**—During 1914–18 the progress of aero engine development was accelerated considerably by the concentration of effort on the development of the aeroplane as a military weapon. Prominent among early World War I engines were the air-cooled rotary types. These were radial piston engines built in the general form of Manly's engine but radically different in that the cylinders rotated about a fixed crankshaft. Notable examples of the type were the Gnôme, Le Rhône, Clerget and Bentley used by the Allies and the Oberursel-Gnôme and Goebel of the Central Powers. These engines developed 80 h.p. to 230 h.p. and weighed 1.9 lb. to 3 lb. per horsepower. The rotary engine suffered from many inherent disadvantages but, in comparison with the more conventional engines currently available, it had the important advantages of lower weight and smoother running.

Design refinement of the in-line water-cooled engine reduced its

weight and introduced a new generation of Allied engines with 8 or 12 cylinders arranged in two banks in V form. Noteworthy among these were the 300-h.p. Hispano-Suiza (France), the 350-h p. Rolls-Royce Eagle (Great Britain) and the 420-h.p. Liberty (U.S.); the European engines had weight/power ratios around 2 3 lb. per horsepower compared with 2.11 lb. per horsepower for the Liberty. Contemporary with the Allied Powers' V types were the six-cylinder in-line Mercedes, Benz and Maybach engines of the Central Powers, ranging from 100 h p. to 260 h.p. and weighing more than 3.5 lb. per horsepower.

Notable engines under development in Britain when World War I ended were the 380 h p. Cosmos Jupiter (later taken over by the Bristol company), a nine-cylinder air-cooled radial weighing about 1 7 lb. per horsepower; the 450-h p Napier Lion, a 12-cylinder, three-row, in-line water-cooled engine weighing 1.86 lb. per horsepower; and the 300-h.p. air-cooled Armstrong-Siddeley Jaguar. The Jaguar was the first aero engine to be designed with a mechanically driven supercharger.

**Between Wars, 1918–39.**—In this period a remarkable advance in aero engine efficiency was achieved and many long-distance flights demonstrating improved reliability were accomplished. Noteworthy among these was the first nonstop Atlantic crossing on June 14–15, 1919, by John Alcock and Arthur Brown in a Vickers' Vimy bomber powered by two 350-h p. Eagle engines. Improved fuels and supercharging played a large part in increasing output from about 500 h p. to 1,000 h.p and reducing the weight/power ratio from about 1.5 to nearly unity.

Development was intensified in the 1930s, particularly in Europe. In 1932 the Bristol Aeroplane Company, Ltd , produced the first aero sleeve-valve engine, the nine-cylinder air-cooled radial Perseus of 560 h.p., and in 1934 the Rolls-Royce Merlin started its long and illustrious career at about 900 h.p. A noteworthy engine of this era was the 600-h p. Junkers Jumo 205C two-stroke diesel. In the United States, the General Electric company brought to fruition the exhaust turbosupercharger, an idea which dated back to World War I and which had been the subject of experiment in many countries at various times.

**Engines of World War II.**—Again the influence of war resulted in an accelerated rate of engine development, best illustrated perhaps by the Merlin, which earned fame by powering Hurricane and Spitfire fighters in the battle of Britain. The military rating of the Merlin rose from 1,030 h.p. in 1939 to 1,830 h.p. in 1945. Its weight/power ratio based on these figures fell from 1.33 lb. per horsepower to 0.94 lb. per horsepower.

Apart from the development of particular engines to higher power by supercharging, etc., as in the case of the Merlin, larger engines were introduced into service as the war progressed and, by 1945, engines of 2,500 h.p. were in use. These larger engines succeeded in pegging weight/power ratio near unity in spite of the unfavourable influence of scale effect.

The liquid-cooled V and air-cooled radial types predominated in combat aircraft used by the Allies and axis powers. A significant difference in German engines was the use of direct fuel injection into the engine cylinders in place of the carburettor or bulk injectors used on Allied engines.

New basic engine types were introduced by both sides during the last year of the war. Of particular interest was the German use of a rocket engine in interceptor fighters, and a pulsejet engine in the V-1 missile. The V-1 brought the British Meteor fighter, powered by two Rolls-Royce Welland turbojets of 1,600 lb. static thrust, into service in Great Britain in 1944 as a defense measure.

British and German turbojet fighters appeared on the western front in 1945. By this time, the Meteor had two Rolls-Royce Derwent Mark 1 engines of 2,000 lb. thrust, weighing 0.48 lb. per pound thrust. German turbojets were heavy and uneconomical in comparison; *e.g.*, the widely used Jumo 004B gave 1,980 lb. thrust and weighed 0.82 lb. per pound thrust.

**Advent of the Gas Turbine.**—The first gas turbine to fly powered a Heinkel jet aircraft flown in Germany in Aug. 1939. Development of the Heinkel turbojet was abandoned, however, and the axial type subsequently developed in Germany had not flown when Frank (later Sir Frank) Whittle's W.1 turbojet powered the Gloster E 28/39 aeroplane on its maiden flight in Britain on May 14, 1941. Whittle's W 1 engine, which gave 855 lb thrust and weighed 620 lb., was the direct ancestor of a line of centrifugal turbojets designed by Rolls-Royce in Britain and the General Electric company in the United States.

Conversion of the Rolls-Royce Derwent turbojet by fitting a propeller and reduction gear produced the Trent experimental turboprop which powered a Gloster Meteor aircraft and thus became the first turboprop to fly (Sept. 20, 1945). The Trent gave 790 h p. and 1,220 lb. jet thrust.

By mid-century the turbojet had replaced the piston engine in most fighter aircraft and in some bombers. The appearance of the first turboprop air liner prototype, the Vickers Viscount, in Britain in 1948, and the first turbojet air liner prototypes in Canada (A V Roe C 102) and Britain (Comet) in 1949, indicated the strength of the challenge of the gas turbine in the transport field.

## GENERAL REQUIREMENTS

The design of an aero engine is governed by four major considerations It must be reliable and give a period of useful operation between overhaulings sufficiently long to make it an economic proposition Its weight and fuel consumption must be as low as possible and its frontal area must be as small as possible Reliability and long life must always be the primary considerations, although they may have to be sacrificed temporarily in cases of extreme military emergency. The order of importance of the remaining criteria is determined by the speed, operating height and range of the aircraft for which the engine is intended. The aero engine design problem involves an attempt to satisfy simultaneously these interrelated and sometimes conflicting requirements.

**Reliability.**—The failure of an aircraft engine is a serious matter if, as a result, the pilot has inadequate power to manoeuvre his aircraft as he desires. Although modern civil aircraft are designed, in accordance with an international agreement, to have adequate reserves of power to meet all reasonable cases of engine failure, reliability remains as the first criterion of aero engine design and each individual engine type is subjected to exhaustive tests totalling thousands of hours, both on the ground and in flight, before being certified as an airworthy type for installation in production aircraft. A similar high design standard is set for all accessories and systems on which the engine depends, such as propellers, fuel and oil systems, etc.

Reliability in an efficient aero engine is not easily obtainable because of the importance of the simultaneous achievement of low weight, which entails minimum scantlings stressed to the economic optimum and a never-ending search for improved materials to carry high stress at elevated temperatures.

**Low Weight.**—The maximum weight of an aeroplane at take-off is limited by its take-off performance or by the strength of its structure. The importance of lightweight design of every component, including the power plant, is best illustrated by a simplified example relating to a typical piston-engined air liner with a maximum take-off weight of 100,000 lb. In round figures, the aircraft structure weighs 30,000 lb., the power plant 20,000 lb. and crew and equipment 10,000 lb., giving a total equipped weight of 60,000 lb. The remaining 40,000 lb. is disposable load, to be allocated between fuel and pay load (passengers and cargo) according to the distance to be flown.

When flying the maximum distance, with tanks filled to capacity, the maximum fuel weight is 35,000 lb., leaving 5,000 lb. for pay load. In this case, the pay load, which determines the revenue and profit of the operator, is only 5% of the take-off weight and it is easily verified that a small percentage decrease of the equipped weight produces a large percentage increase of the revenue-producing pay load. For example, 10% reduction of power plant weight, 2,000 lb., would give a 40% increase of pay load.

The foregoing applies to an existing aircraft with a fixed structure weight. Considering a new design, a reduction of equipment weight permits reduction of wing area and structure weight, and a lighter and smaller aeroplane requiring less power and fuel can be designed for given range and pay load. Reduced first costs (proportional to weight) and lower operating costs result.

**Low Fuel Consumption.**—It is clear from the foregoing that similar benefits derive if the fuel load is reduced by lowering the specific fuel consumption of the engine; that is, fuel consumption rate per horsepower developed, or pounds per horsepower per hour. The benefits resulting from reduction of fuel load may be slightly smaller than those obtained from an equal reduction of equipment weight for two reasons: first, because the mean aircraft weight is higher, and slightly higher power (and fuel consumption) is required during the flight; second, because it is possible to arrange the fuel tankage in a new aircraft design in such a manner that alteration of the fuel load has little effect on structure weight Nevertheless, achievement of minimum fuel consumption is an important objective, particularly when considering aircraft designed to fly great distances.

**Interrelation of Weight and Fuel Consumption.**—Power plant weight and fuel consumption must be considered simultaneously in order to determine the most suitable type of power plant for a particular aircraft role. The obvious criterion is the sum of the power plant weight and the weight of fuel consumed by the engine during a specified time at a specified height, power and air speed Different types of power plant may be compared in this manner but it should be noted that the method does not include the effects of the different engine types on the aircraft configuration and performance, and the answer obtained must be regarded as a first approximation. Borderline cases must be the subject of detailed aircraft design studies, to make certain of choosing the most suitable engine type.

Comparison of the turbojet with the piston engine and propeller combination provides an interesting example of the interrelation of weight and fuel consumption. At a moderate air speed, say 400 m.p.h., the turbojet consumes fuel at approximately twice the rate of the piston/propeller for the same thrust-horsepower but its power plant weight is only about one-third that of the piston/propeller. The difference of power plant weight in favour of the turbojet is exploited by carrying additional fuel in the jet aircraft, thus enabling it to compete with the piston-engined aircraft up to at least 1,000-mi. range at 400 m.p.h.

**Small Size.**—"Parasitic drag," which represents a considerable proportion of the total drag of an aeroplane, is dependent on the frontal area of the aircraft. It increases as the square of the air speed up to speeds in the region of acoustic velocity where it begins to increase even more rapidly. In addition, changes of frontal cross section (*e.g.*, large engine nacelles on thin wings) are a source of unwanted drag at high air speeds.

The engine which can be installed entirely within the aircraft contours necessary to house the specified load makes an invaluable contribution to the important objective of minimum aircraft frontal area. The engine which adds to the frontal area must be debited with the concomitant drag increase.

**Altitude Power.**—Atmospheric density falls rapidly as altitude increases, reaching 20% of its sea level value at 44,000 ft. As the internal-combustion engine burns an approximately constant volume of air-fuel mixture in unit time, it follows that the weight of air-fuel mixture per unit time and the power extracted therefrom vary almost directly with atmospheric density, unless steps are taken to restore sea level conditions at the engine induction manifold by precompression in a supercharger.

In the piston engine, the power absorbed in overcoming internal friction is appreciable, and is independent of atmospheric density. In an unsupercharged engine, therefore, the power available to drive the propeller falls more rapidly than the atmospheric density, reaching about 9% of sea level power at 44,000 ft. An unsupercharged engine developing 1,000 h.p. at 44,000 ft. would be about 11 times the size and weight of an engine developing 1,000 h.p. at sea level, but if supercharged to 44,000 ft. it would be of reasonable size and weight.

In comparison with the piston engine, the gas turbine mass air flow falls less rapidly with increase of altitude and its internal friction losses are negligible. Furthermore, its mass air flow increases appreciably with increase of air speed. Thus, the turboprop is able to maintain its sea level power (static) up to 20,000 ft. at 400 m.p.h.

## DESIGN PROBLEMS: GASOLINE PISTON ENGINES

**Detonation.**—The dominating factor in gasoline engine design is a combustion phenomenon termed "detonation." When detonation occurs the flame spreads throughout the charge in the cylinder at greatly accelerated speed, creating a high-pressure gas wave which produces an audible knock, akin to the noise of a hammer blow on metal, when it reaches the cylinder wall. Mild intermittent detonation is not serious. Prolonged violent detonation frequently results in piston failure In a given engine, the tendency to detonate varies with the type of fuel used, and detonation may be suppressed by injecting water, alcohol or water-alcohol mixtures into the induction system.

With a given fuel, the major factors affecting detonation are the air/fuel ratio and the pressure and temperature of the compressed mixture in the combustion chamber. A mixture rich in fuel defers the onset of detonation High pressure and temperature have the opposite effect In different engines using the same fuel, design details, such as the shape of the combustion chamber and the relative positions of spark plugs and valves, exert considerable influence on detonating tendencies.

**Compression Ratio.**—Power output and specific fuel consumption are governed by the engine compression ratio· that is, the ratio of the maximum cylinder volume (piston at bottom) to the combustion chamber volume (piston at top). High compression ratio yields high power and low specific consumption, but it entails high pressure and temperature of the air-fuel mixture after compression and, therefore, increased tendency to detonate The type of fuel available thus limits the maximum compression ratio and consequently limits maximum power output and minimum specific consumption.

**Supercharging.**—Supercharging involves the provision of a compressor which delivers air or air-fuel mixture at a pressure and temperature above those of the atmosphere. Although introduced originally for the purpose of maintaining sea level pressure in the induction manifold at altitude, the principle was extended to provide higher manifold pressures in order to increase power output and reduce weight/power ratio.

Increase of manifold pressure and temperature results in higher pressure and temperature of the air-fuel mixture in the cylinder after compression and increased tendency to detonate. With a given fuel, a choice must be made between a high degree of supercharge coupled with low compression ratio, and low supercharge with high compression ratio. The former yields an engine of small bulk with low weight/power ratio and high specific fuel consumption; the latter choice, a larger and heavier engine with lower specific consumption.

The centrifugal compressor established its supremacy at an early stage in supercharging experiments and maintained it thereafter. It accelerates the air to high velocity in a radial-vaned impeller and converts the kinetic energy into static pressure in a diffuser.

In many applications the supercharger is mechanically driven from the engine crankshaft through a speed-increasing gear. Ideally, the drive should provide variable speed in order to avoid unnecessary power loss at low altitude, but the added complication of a variable-speed drive is not warranted in many cases. A concession is often made by providing a two-speed drive.

The exhaust turbosupercharger is driven by a turbine deriving its power from the engine exhaust. In addition to using energy which might otherwise be wasted, this method of supercharging provides variable-speed drive without mechanical complication.

**Air/Fuel Ratio (Mixture Strength).**—The range of ignitable air-gasoline mixtures is reasonably wide. For each engine throttle setting there is an air/fuel ratio yielding maximum power, and a higher ratio (weak mixture) giving minimum specific consumption at lower power. Air/fuel ratios below the optimum for power (rich mixture) reduce power and increase specific consumption.

The antidetonating effect of rich mixture is exploited by using high manifold pressure to give high power for short period operation; *e.g.*, at take-off, when consumption is unimportant. Detonation limits the use of weak mixture to cruising power, where minimum consumption is essential. Fortunately, the magnitude of the effect of air-fuel ratio on detonation is such that an acceptable

cruising-take-off power ratio is obtained.

Equal distribution of both fuel and air to all cylinders is important since the air-fuel ratio in the worst cylinder limits the performance of the whole engine.

**Cooling System.**—If the engine cylinders, and particularly the cylinder heads, are not adequately cooled the performance deteriorates and engine failure may result. On the other hand, overcooling must be avoided. It is not necessarily beneficial to the engine and it entails unnecessarily high cooling system drag. Equal cooling of all cylinders must be achieved if one cylinder is not to limit performance unduly.

The relative merits of air cooling and liquid cooling have been debated frequently. The fact that both survived in competition presents adequate proof that there are advantages peculiar to each system.

The oil used to lubricate bearings, gears, etc., absorbs heat in its passage through the engine and must be kept below a maximum temperature limit if its lubricating qualities are to be maintained. Again, overcooling is undesirable since, in addition to unnecessary drag, a film of oil may congeal on the metal surfaces of the cooler and eventually render it ineffective.

## PISTON ENGINE TYPES

Aero piston engines are classified according to cooling system, arrangement of cylinders, heat cycle, etc The four-stroke, spark ignition, gasoline cycle predominates to such an extent that its use may be assumed unless specifically stated otherwise. Conventional poppet valves in the cylinder head may be assumed also in the absence of a contrary statement. The most popular types in the larger engine sizes are the air-cooled radial and the liquid-cooled **V**.

**Air-Cooled Radial.**—A notable engine of this type was the 18-cylinder, two-row, sleeve-valve Bristol Centaurus, descendant of the first sleeve-valve engine (Perseus) of 1932. The Mark 662 operating on 115/145 grade fuel develops 2,810 h.p. at 2,900 r.p.m. for take-off; 2,405 h.p. at 7,750 ft. and 2,280 h.p. at 16,000 ft., in low- and high-speed supercharger drive, respectively, when cruising at 2,400 r.p.m. It weighed 3,270 lb., giving a weight/power ratio of 1.16 lb. per horsepower; its diameter was 56.6 in.

The largest radial engine at mid-century was the four-row, 28-cylinder Pratt and Whitney Wasp-Major. Model B.13 operating on 115/145 grade fuel developed 3,250 h.p. at 2,700 r.p.m. for take-off; 2,650 h.p. at 6,000 ft.; and 2,300 h.p. at 16,300 ft., when cruising at 2,550 r.p.m. It weighed 1.08 lb. per take-off horsepower and its diameter was 54 in.

**Liquid-Cooled V.**—Developed from the World War II Merlin, the Mark 620 was an excellent example of the type. It employed a very high degree of supercharge necessitating a two-stage, two-speed supercharger to obtain the required pressure ratio and a charge cooler to reduce the induction temperature. The coolant used in both radiator and charge cooler was a mixture of water and ethylene-glycol.

The Mark 620 gave 1,725 h.p. for take-off at 3,000 r.p.m. on 100/130 fuel. For cruising, 1,180 h.p. was obtained at 2,650 r.p.m. at 10,500 ft.; and 1,165 h.p. at 2,850 r.p.m. at 23,750 ft., in low and high supercharger gears, respectively. It weighed 1.01 lb. per take-off horsepower and its maximum height and width were 43.2 in. and 31.3 in., respectively

**Air-Cooled V.**—Eight- and twelve-cylinder engines of this type at mid-century ranged in power from 150 h.p. to 600 h.p. and in weight/power ratio from 2.4 lb. to 1.4 lb. per horsepower.

**H or ⌅ Engines.**—This cylinder arrangement was developed in both air-cooled and liquid-cooled forms, the largest engine of the type being the 24-cylinder, sleeve-valve, liquid-cooled Napier Sabre. The Mark 5 Sabre gave 2,565 h.p. at 3,850 r.p.m. for take-off on 100/130 fuel, for a weight of 0.95 lb. per horsepower.

**In-Line Engine.**—This type survived mainly in small four- or six-cylinder engines suitable for light aircraft operating on lower-grade fuel. At mid-century these ranged in power from 90 h.p. to 380 h.p. and in weight/power ratio from 3.0 lb. to 1.65 lb. per horsepower.

**Flat Engine.**—Designed for mounting within the contours of the aeroplane wing, the flat engine virtually consists of two horizontal in-line engines operating on a common crankshaft. Engines of the type have two, four, six or eight cylinders, are mainly air-cooled and use lower-grade fuel. They ranged from 20 h.p. to 320 h.p. at mid-century and from 3.0 lb. to 1.8 lb. per horsepower.

**Two-Stroke Gasoline.**—The two-stroke cycle attracted much attention throughout the history of aero engines, because of potentially greater power for a given engine size and correspondingly low weight/power ratio. The type was not brought to fruition in a large gasoline engine although small unsupercharged aero engines of 20 h.p. to 60 h.p. continued to be marketed. These had a good weight/power ratio for their size, offset by high fuel consumption.

**Diesel Engine.**—The low specific consumption achieved by diesels in other forms of transport naturally attracted much attention and aero diesels were developed in several countries at various times The most successful, in that it was used in commercial and military aircraft, was the six-cylinder opposed-piston, two-stroke Junkers Jumo 205C, which developed 600 h.p. and had a specific consumption of 0.38 lb per horsepower per hour. Its weight/power ratio of 1.85 lb. per horsepower, though low for a diesel, was sufficiently high to limit its use to relatively long-range aircraft.

**Composite Engine.**—The composite engine is a combination of two engines of basically different design; *e.g.*, a piston-turbine combination. Such designs usually aim at higher power and lower specific consumption by utilization of the waste heat in the piston engine exhaust. An excellent example of a simple form of composite engine was the Wright Turbo-Cyclone 18, which combined the 2,700 h.p. R.-3,350 with three impulse exhaust turbines delivering power to the engine crankshaft through reduction gearing. A 20% increase of power and an equivalent reduction of specific consumption was claimed for this arrangement.

## DESIGN PROBLEMS: TURBINE ENGINES

The essential components of the aero gas turbine are its compressor, combustion chamber (or chambers) and turbine. In the turbojet, the power developed by the turbine just balances the power required to drive the compressor, and the engine output is measured in terms of a thrust force (pounds weight). In the turboprop, additional power is developed by the turbine to drive the propeller, and the output is measured in terms of horsepower plus a small residual thrust component. High power (thrust) output and good economy demand high compressor and turbine efficiencies and high combustion efficiency coupled with minimum pressure loss in the combustion system.

In contradistinction to the intermittent combustion of fuel at approximately constant volume in the piston engine, combustion in the aero gas turbine occurs continuously at nearly constant pressure. The design variables affecting the power output and fuel economy of the constant pressure heat cycle, namely the compressor pressure ratio, the maximum cycle temperature (or turbine inlet temperature) and the propulsive efficiency of the power plant at the appropriate aircraft speed and altitude, are closely interrelated.

**Propulsive Efficiency.**—Propulsive efficiency is the ratio of the power usefully employed in propelling the aircraft to the power available in the engine. It is a maximum when the difference between aircraft speed and jet velocity is small. In this respect, there is no fundamental difference between the engine-driven propeller and jet propulsion.

The propeller employs low jet velocity in relation to aircraft speed and therefore attains high efficiency; *e.g.*, 85% up to about 450 m.p.h. air speed. Above this air speed the efficiency of the conventional propeller drops rapidly because of the inefficiency of its blades as airfoils at speeds (including rotational component) approaching acoustic velocity. At 700 m.p.h. its efficiency may be 50% or less.

The turbojet employs high jet velocity (1,000 m.p.h. to 1,500 m.p.h.), and at 300 m.p.h. air speed its propulsive efficiency is about one-half that of the propeller.

As aircraft speed is increased, the diminishing difference between jet velocity and aircraft speed rapidly improves jet efficiency, which reaches parity with propeller efficiency at about 550 m.p.h. (55%–70%). At 700 m.p.h., jet efficiency is 65%–80% compared with 50% or less for the conventional propeller. These propulsive efficiency values largely explain the high fuel consumption of the turbojet at low air speed and its superiority at high air speed.

**Turbine Inlet Temperature.**—High turbine inlet temperature in the aero gas turbine yields maximum power, minimum weight and minimum frontal area, and, in the turboprop, minimum specific fuel consumption. In the turbojet, however, specific consumption increases with the increase of turbine inlet temperature unless the compressor pressure ratio is raised simultaneously. Since material strength properties are seriously reduced at high temperature, an increase of turbine inlet temperature demands improved materials for the combustion chamber, turbine, etc., or direct cooling of these items, unless engine reliability is to suffer. With materials available at mid-century, turbine inlet temperatures of 800°–850° C. (1,470°–1,560° F.) were in common use.

**Pressure Ratio.**—For a given value of turbine inlet temperature, there is an optimum value of compressor pressure ratio yielding maximum power and minimum weight-power ratio. Increase of pressure ratio above this optimum value reduces power but may improve specific fuel consumption if compressor efficiency can be maintained at a high level as the pressure ratio is increased.

The operating height and speed of the aircraft also affect the optimum pressure ratio, and the selection of a pressure ratio and turbine inlet temperature in a new engine design normally entails a compromise based on the relative importance of engine weight, frontal area and

specific fuel consumption in the type of aircraft for which the engine is intended.

## TURBINE ENGINE TYPES

Gas turbine engines are classified according to the type of compressor used, centrifugal or axial, the centrifugal type being similar in principle to the piston engine supercharger. In the axial compressor air is constrained to move along a contracting annulus between a stationary casing and a moving rotor, by the action of alternate rows of fixed and moving airfoil blades which are mounted radially in the casing and rotor respectively. In comparison with the centrifugal compressor, the axial has lower frontal area for the same mass air flow (and power) and higher compression efficiency at the higher pressure ratios necessary for improved fuel economy.

**Centrifugal Turboprop.**—An example of the type was provided by the Armstrong Dart, with a two-stage, single-sided compressor driven by a two-stage turbine, which also drove the propeller through reduction gearing. The Dart had seven combustion chambers and developed 1,400 s.h.p. (shaft horsepower) and 365 lb. jet thrust, or 1,540 e.h.p. (equivalent horsepower = shaft horsepower plus jet thrust divided by 2.6), for take-off at 14,500 r.p.m. The Dart weighed 930 lb., giving it a weight/power ratio of 0.6 lb. per equivalent horsepower; its diameter was 38.5 in.

**Axial Turboprop.**—In the smaller sizes, the low frontal area of the axial is offset to some extent by the grouping of engine auxiliaries around it. Nevertheless, the Armstrong Siddeley Mamba, giving 1,420 e.h.p. for take-off at 15,000 r.p.m. inside 31 in. diameter, provided a good illustration of low frontal area. The Mamba was similar to the Dart in mechanical arrangement, having a two-stage turbine and six combustion chambers. Its weight/power ratio was 0.54 lb. per equivalent horsepower.

In the 3,500-e.h.p. Bristol Proteus design length was saved at the expense of diameter by grouping the combustion chambers around the axial compressor. Even so, its diameter was the same as that of the Dart (38.5 in.) and about 70% of that of an air-cooled radial piston engine of equivalent power. The Proteus was noteworthy for its "free turbine" arrangement—the first two stages drove the compressor; the final (third) stage was on a separate shaft and drove the propeller through reduction gearing.

The Mamba and Proteus were also produced in coupled form; that is, two engines driving a contrarotating propeller through a common reduction gearbox. Coupling is a convenient way of doubling power plant output and has the potential advantage of better fuel economy at low or medium altitude where part-load specific consumption may be improved by stopping one engine of the pair.

An interesting example of a coupled turboprop was the Allison Model 500, which developed about 5,500 e.h.p. and weighed only 0.48 lb. per equivalent horsepower.

**Centrifugal Turbojet.**—The influence of the Whittle W.1 design can be traced in the Rolls-Royce Nene of 49.5 in. diameter, with a double-sided impeller driven by a single-stage turbine and combustion chambers. It gave 5,000 lb. thrust for take-off at 12,500 r.p.m. and weighed 0.35 lb. per pound thrust. This engine was built under licence by Pratt and Whitney (Turbo-Wasp).

Comparable to the Nene but featuring the single-sided impeller of the piston engine supercharger was the Goblin by de Havilland Ghost, power plant of the prototype Comet. It weighed 0.44 lb. per pound thrust and had a diameter of 53 in.

**Axial Turbojet.**—The General Electric J.47, giving 5,000 lb. thrust for take-off at 7,950 r.p.m. within 37 in. diameter and weighing 0.51 lb. per pound thrust, provided an interesting comparison with similar thrust centrifugal turbojets.

The use of a single annular combustion chamber, pioneered by Metropolitan-Vickers in Great Britain, is desirable if full advantage is to be gained from the low frontal area of the axial compressor. This is illustrated in the Westinghouse J.34, which gave 3,500 lb. thrust for take-off at 12,500 r.p.m. within 28 in. diameter and weighed 0.39 lb. per pound thrust.

**Turbojet with Reheat.**—The turbojet exhaust is sufficiently rich in oxygen due to high air-fuel ratios used, to support combustion of additional fuel downstream of the turbine, a process termed "reheat" or "afterburning." The absence of moving parts downstream of the combustion zone permits the use of high reheat temperatures, and static thrust increases of the order of 50% are theoretically possible. In flight the percentage increase of net thrust is doubled at high air speeds. Reheat is similar in principle to the ramjet and involves over-all flight specific consumptions two or three times those of the basic turbojet. Because of its high fuel consumption reheat is suitable for short period operation only.

## OTHER JET TYPES

**Ramjet.**—Essentially the ramjet consists of an intake designed to convert the kinetic energy of the air to static pressure, a combustion chamber and final expansion nozzle. In principle it is similar to the turbojet, but the absence of moving parts permits operation at much higher temperatures. Because it depends on air speed to obtain the necessary pressure ratio, it needs external assistance to reach the designed operating speed and become self-sustaining.

There was little factual data available on ramjet performance at mid-century. Its major advantage is extremely low weight, but it requires speeds of the order of 1,500 m.p.h. before its specific fuel consumption becomes competitive with that of the turbojet with reheat.

**Pulsejet.**—The pulsejet engine, as developed in Germany, has no moving parts except for numerous flexible reed valves completely covering the intake and controlled by pressure fluctuations produced by intermittent explosions in the combustion chamber behind them. The engine is self-starting and, unlike the ramjet, develops static thrust. Its advantages are low weight and cost, but its specific consumption is high (three to four times that of turbojet). As used in the V-1 missile its useful life was limited by inlet valve failure to less than two hours.

**Rockets.**—The fact that its propellents contain both fuel and oxidizer simultaneously confers upon the rocket motor the unique advantage of independence of atmospheric conditions and the disadvantage of extremely high propellent consumption rate, offset to a small extent by low engine weight. High jet velocities (3,500 m.p.h.–5,000 m.p.h.) are generated, resulting in low propulsive efficiency at low air speeds. Clearly, the most efficient use of the rocket motor involves extremely high operating heights and air speeds.

Solid propellent rockets were used extensively in World War II, to assist the take-off of highly loaded aircraft. This is a special case in which the propellent weight is consumed before the take-off is completed and the dead weight of fixtures may be jettisoned. Rather similar considerations apply to the suggested use of rockets for climb boost on turbojet-engined aircraft.

Liquid propellent rockets were used as the sole propulsive unit in several aircraft, notably German interceptor-fighters and the experimental U.S. Bell X.1, which was reported in 1949 to have exceeded acoustic velocity. The Walter 109-509-A.1 motor of the ME 163 weighed 370 lb. and gave 3,740 lb. thrust for a specific propellent consumption of 20.6 lb. per hour per pound thrust. The propellents were 80% hydrogen peroxide (oxidizer), and a fuel mixture of 57 parts methyl alcohol, 13 parts water and 30 parts hydrazine hydrate—the latter to produce spontaneous ignition in the combustion chamber. The Reaction Motors 6,000-C4 motor of the X.1, weighed 380 lb. and gave 6,000 lb. thrust for 17.2 lb. per pound thrust per hour specific consumption. The propellents were liquid oxygen and 75% ethyl alcohol.

Many possible combinations of chemical substances were suggested for rocket motors to reduce propellent consumption and provide greater safety. The monopropellents, containing both fuel and oxidizer in a single substance (*e.g.*, hydrogen peroxide and nitromethane), are of interest as a move in the direction of greater simplicity.

## FUELS AND LUBRICANTS

The most significant of many requirements common to all aero engine fuels are high calorific value, low freezing point and low volatility. They must also be relatively free from harmful impurities.

Calorific value is a measure of the heat energy released by combustion, and high calorific value yields low specific consumption. Hence the extensive use of hydrocarbon fuels derived from petroleum.

The freezing point, defined in terms of wax deposition, which may clog filters, etc., in the fuel system, is usually specified as not higher than —60° C. (—76° F.).

Low volatility reduces the likelihood of fire if fuel is accidentally spilled over hot surfaces; *e.g.*, during a crash landing.

**Gasoline.**—The two most important characteristics of gasoline fuels are volatility and detonation resistance. Volatility affects the combustion process, particularly when operating at low air temperatures. High volatility aids starting while low volatility may initiate rough running and adversely affect piston engine specific consumption. On the other hand, highly volatile fuel may "boil" in the aircraft tanks at altitude with consequent loss of fuel vapour through the tank vents and interruption of the fuel flow to the engine resulting from vapour locking in the fuel system.

The antidetonating qualities of gasoline fuels are determined by comparative testing against reference fuels of known detonations resistance in a standard test engine. The test procedure covers air/fuel ratio effects, and fuels are graded by awarding performance numbers; *e.g.*, 115/145 grade, indicating relative detonation resistance weak/rich. Single grading numbers of 100 or lower (*e.g.*, 87 octane) derive from an earlier test procedure which compared a given fuel, at one mixture strength only, with blends of iso-octane (high detonation resistance) and heptane (low detonation resistance), octane number being simply the percentage of iso-octane in the iso-octane-heptane blend of equivalent detonation resistance. The limit of the octane scale is 100 corresponding to 100 performance number.

Tetraethyl lead (T.E.L.) is extremely effective in raising the detonation limit of most hydrocarbon fuels. Its use introduces extra design problems in high-duty engines, but the results achieved fully justify the additional design effort.

**Turbine Fuels.**—With minor mechanical modifications the aero gas turbine can be adapted to burn a variety of hydrocarbon fuels ranging from diesel oil to low specific gravity gasoline. The optimum fuel is that giving the highest specific gravity (and calorific value) consistent with a freezing point of —60° C. or thereabouts and low volatility. In the absence of a detonation problem on the gas turbine, these requirements are not incompatible and are met by a fuel similar to the vapourizing oil used in farm tractors, etc.

**Lubricants.**—The aero piston engine demands a high-viscosity oil because of the high loadings of its bearings and propeller reduction gear teeth, both reduced to minimum proportions to achieve low weight The change of oil viscosity with temperature should be small to avoid engine starting troubles at low temperatures.

Turbojet engines normally use ball and roller bearings and operate on thinner oil, with consequent alleviation of the low-temperature starting problem.

The turboprop demands a compromise between the requirements of its ball and roller main bearings and its reduction gearbox

**AEROLOGY, AEROLOGIST.** In general, words denoting respectively the study of the atmosphere and one who is an expert in that study, hence synonymous with meteorology (*q v.*) and meteorologist. Frequently, however, and particularly among professional meteorologists, these terms are used with exclusive reference to the upper air But this use gradually declined in the United States because after 1917 in the U S. navy aerology has been the official term for the science and practice of meteorology, including weather forecasting. Navy weather officers are aerologists.

(R. G. SE )

**AERONAUTICAL ARTICLES.** The subject of aeronautics is treated in several series of articles Under FLIGHT (NATURAL), will be found a study of birds' flight. From this readers can pass to a general survey of artificial flying under AERONAUTICS and AVIATION, CIVIL. Famous flights are discussed under TRANS-OCEANIC AND TRANS-CONTINENTAL FLIGHTS.

The navigation and development of the balloon, and its transformation into an airship, can be studied in the articles BALLOON; AIRSHIP; and AIRSHIP SHEDS. Heavier-than-air flying machines are treated in the articles AEROPLANE; BIPLANE; MONOPLANE; HELICOPTER; ORNITHOPTER; GYROPLANE; and AILERON.

Flying machines capable of alighting upon water are dealt with in the article SEAPLANE; in this connection the article AIRCRAFT CARRIERS studies an important factor in the application of flying machines to naval warfare The question of aircraft terminals and accommodation is treated in the articles AERODROME and AIRSHIP SHEDS. For engine details *see* the articles AERO ENGINES; INTERNAL COMBUSTION ENGINES; and AIRSCREW. The practical navigation of aircraft and their employment for various purposes can be studied in the articles entitled AERIAL NAVIGATION, and AVIATION, CIVIL. There are special articles on the PARACHUTE; AERODYNAMICS; and AERIAL LAW.

**AERONAUTICS.** The record of man's attempts to fly goes back into the remote past. The story of Icarus is a myth founded perhaps on some early failure to imitate the birds. Leonardo da Vinci thought and wrote about it, and there are some references to the subject in the works of Francis Bacon. In 1617 Fleyder of Tübingen lectured on flying; while in Italy, again, in his book *De motu animalium* (1680), G. A. Borelli discussed the question in connection with the strength of man's muscles and came to the conclusion that such flight was impossible.

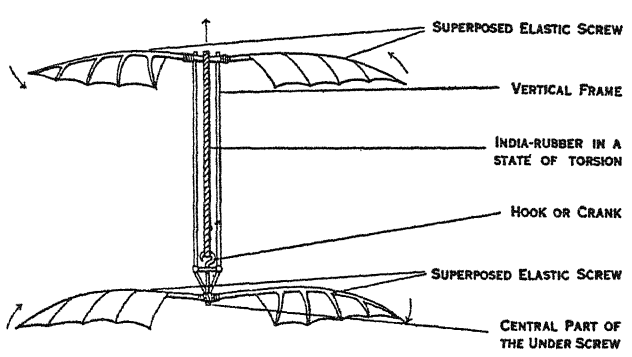

FIG. 1.—PENAUD'S HELICOPTER OR SCREW MODEL BUILT IN 1872 MOST OF THE PIONEERS IN AERONAUTICS DIRECTED THEIR ATTENTION TO THE CONSTRUCTION OF MODELS CAPABLE OF VERTICAL FLIGHT

**Early History of Artificial Flight.**—We are here concerned mainly with the flight of bodies heavier than air; for the early history of airships *see* BALLOON and AIRSHIP The first attempts, limited in all cases to the flight of models, were generally based on the endeavour to imitate the action of a bird's wings Sir George Cayley, however, in 1796, constructed a tiny helicopter in which two windmills made of gull feathers were caused to revolve about a vertical axis. Figs. 1 and 2 illustrate two models due to Penaud, constructed in the early '70s of the 19th century; in the first of these the motive power is obtained from a screw driven by

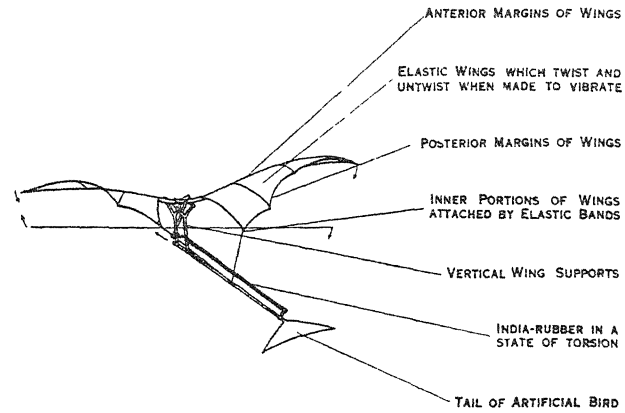

FIG 2.—PENAUD'S SECOND MODEL, WHICH WAS PROPELLED BY A SCREW AND SUSTAINED BY A HORIZONTAL FLEXIBLE WING PENAUD'S SUCCESS OVER OTHER SIMILAR MODELS WAS LARGELY BECAUSE OF THE INVENTION OF WHAT HE CALLED AN AUTOMATIC RUDDER, WHICH WAS A SMALL WING PLACED AFT OF THE MAIN WINGS

the torsion of an India-rubber cord; in the second an attempt is made to imitate the action of a bird's wings. W. S. Henson and J. Stringfellow in 1842 had already constructed models in which the supporting force was obtained from the wings while the motive power came from a screw, and from that time on some of the fundamental principles underlying flight began to be more generally recognized.

**Early Mechanical Machines.**—Early experimenters learned that a flat rectangular plane, when moved edgewise through the air, could develop a vertical "lift" as a result of the pressure of the air on the surface. They also learned that the resistance to forward movement, or "drag," could be overcome by the use of a propeller. If an engine of sufficient power and low weight could be devised, it became apparent that a flat surface, or "wing," could be made to move fast enough through the air to enable it to support the combined weight of the wing, engine and propeller and a human occupant. It was on principles such as these that a steam-engine powered machine was patented by Henson in 1842 and the first steam-powered model was successfully demonstrated by Stringfellow in 1848. Stringfellow, in 1868, exhibited at the Crystal palace a model for which he received a prize of £100. Samuel P. Langley, of the Smithsonian institution of Washington, D.C., worked on similar lines. It had been realized by this time that greater lifting power could be obtained by shaping the supporting surfaces; *i.e.*, by giving them a convex shape on the upper side and a concave on the lower. In 1896 a steam-driven model flew for a distance of about one-half mile along the Potomac river near Washington. At a later date Langley built a large machine which was intended for passengers. It was fitted with a remarkably light steam engine designed by Charles M. Manly and driven by two propellers; this was launched into the air from a vessel in the river. On each of the two occasions in 1903 on which it was tried, something went wrong with the launching arrangements, and the machine was wrecked. Another early machine was that of Sir Hiram Maxim; this too was damaged in a trial in 1894.

**Gliders.**—Meanwhile, it had been realized that before success was reached more knowledge as to the conditions of balance in the air was necessary and, further, that much could be learned by the use of gliders depending for their support on natural air currents.

TABLE I

| Year | Experimenter | Tip to tip (feet) | Surface (square feet) | Weight (pounds) | Pounds per square foot | Speed per hour (miles) | Maximum flight (feet) | Motor | Horse-power | Pounds sustained per horse-power |
|---|---|---|---|---|---|---|---|---|---|---|
| 1879 | Tatin | 6.2 | 7 5 | 3.85 | 0.51 | 18 | 100? | Compressed air | 0.03 | 110? |

| 1896 | Pilcher | 23 0 | 170 0 | 200 00 | 1 17 | 25 | 900 | " | 2.00 | 100 |
| 1896 | Chanute | 16 0 | 135 0 | 178 00 | 1.31 | 22 | 360 | " | 2.00 | 89 |
| 1906 | Santos-Dumont | 39 0 | 560 0 | 550.00 | 0.98 | 22.26 | 2,900 | Gasoline | 50.00 | 23 |
| 1908 | W. Wright | 41 0 | 650.0 | 1,100 00 | 1.70 | 37 | 295,000 | " | 24.00 | 46 |

Experimenters, suspended from wings, jumped from natural or artificial heights and allowed the wind to carry them through the air. Otto Lilienthal, in Germany, who first showed the advantage of curving flat surfaces, was killed after making more than 2,000 safe flights in which he endeavoured to maintain his balance by shifting his position relative to the wings. Octave Chanute, in the United States, made the surfaces of the aeroplane movable, and constructed a number of machines.

**The Modern Era.**—Wilbur and Orville Wright, of Dayton, O., began their epoch-making work in 1900 with gliders. They introduced two great improvements: (1) the elevator, or horizontal rudder for steering the machine in the vertical plane, which they placed in front of the main planes (in nearly all modern machines it is attached to the tail); and (2) the flexing of the rear edge of the main planes to vary the lift on either or both at will and thus maintain the balance in the air. A gasoline motor driving a propeller was added in 1903. In 1905 they made 45 flights, in the longest of which they remained in the air for one-half hour and travelled 24½ mi. A little later, 1906, Alberto Santos-Dumont constructed a machine in which he flew a distance of about 250 yd. in 21 sec.

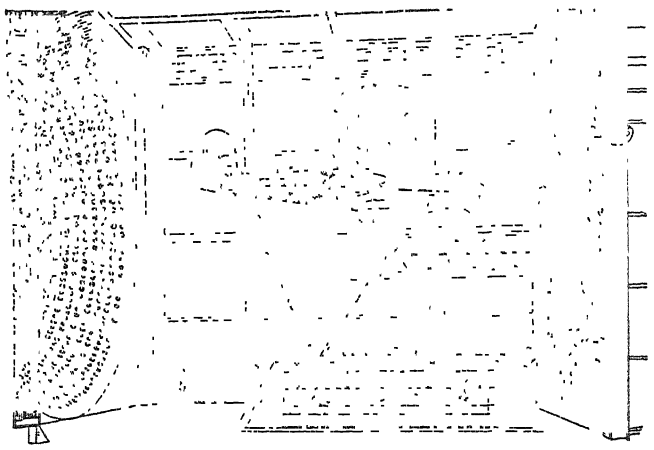
In 1908 Henri Farman, at Issy-les-Moulineaux, Fr., made a circular flight of 1 km. and on Sept. 29 he covered 24½ mi. in 42 min. Meanwhile, the Wrights had continued their work at Dayton. On Sept. 12, 1908, Orville made a flight of 45 mi. in 1 hr. 14⅓ min.; but a few days later he had an accident in which he was seriously injured and his passenger was killed. Wilbur Wright, on Sept. 21, 1908, at Le Mans, Fr., beat all previous records by a flight of 56 mi. in 1 hr. 31 min. 25⅘ sec. On Dec. 31 he remained in the air for 2 hr. 20 min. 23 sec. These great advances had been rendered possible by the improvement of the gasoline engine.

Table I gives some details, approximately correct, of the principal experiments made with flying machines from 1879 to Wilbur Wright's flight in France.

In 1909 a number of notable flights were made, several of them in monoplanes. On July 25 Louis Bleriot crossed the English channel from Calais, Fr., to Dover, Eng., and later H. Latham nearly achieved the same feat. In November Farman covered a distance of about 134¼ mi. in 4 hr. 17 min. 53 sec.

From this time progress in the development of improved flying machines and the accomplishment of record-making achievements was enormous. World War I and the postwar years witnessed the successive progress of aviation as a "wondrous freak," then an implement of destruction in war and finally a useful means of human transportation. The external form of the machine also underwent marked changes from the fragile "boxlike" structure of sticks, paper and wire, through the biplane era of World War I to the sturdy, multiengined, all-metal monoplane transports. The toy models of Henson and Stringfellow were replaced by machines weighing 300,000 lb. or more and having ranges of more than 5,000 mi. Jet-powered fighter aircraft developed shortly after World War II were capable of speeds of more than 500 m.p.h. while research aircraft at mid-20th century had proved the feasibility of human flight faster than the speed of sound. (*See* also TRANS-OCEANIC AND TRANS-CONTINENTAL FLIGHTS.)

## THE SCIENCE OF AERONAUTICS



**Early Experiments.**—Even before 1909, the practical beginning of the era of aviation, experimenters had made remarkable progress in understanding the classic principles of fluid resistance and motion The philosophical papers of Sir Isaac Newton (1642–1727), Jean Bernoulli (1667–1748), Jean le Rond d'Alembert (1717–83), Leonhard Euler (1707–83), Osborne Reynolds (1842–1912) and many other physicists advanced fundamental laws of fluid resistance which were basic to modern aerodynamics theories.

Still, much more had to be learned of the laws relating to the flow of air around aeroplanes in motion, the form and shape of aerodynamic bodies, the proper dimensioning, proportioning and location of wings and control surfaces and the most efficient method for propulsion. Experiments in aerodynamics had been made by Langley in 1891. A. F. Zahm at a later date (1902–03) had measured the air velocity, pressure and friction on surfaces of various forms. Sir Thomas Stanton, at the National Physical laboratory, Teddington, Eng., had experimented on the resistance of surfaces in a current of air and the pressure of the wind on plates. F. W. Lanchester, in his *Aerodynamics,* had described similar measurements. Lord Rayleigh, in various papers of great importance dating from 1876, had discussed questions of the resistance of fluids and in 1899 contributed to the Manchester *Memoirs* a paper on the mechanical principles of flight; but no organized attack on the questions raised by the flight of a body heavier than air had been made.

**Government Sponsorship of Aeronautical Research.**—As early as 1909 governments recognized the importance of concerted and co-ordinated effort in the field of aeronautical research to maintain leadership in aviation. England in 1909 established at the National Physical laboratory an advisory committee for aeronautics. Work of a similar character was in progress elsewhere; in Germany at Göttingen, under L. Prandtl; in Russia at Koutchino, where D. Riabouchinsky was director. In the United States on March 3, 1915, congress established the National Advisory Committee for Aeronautics (NACA) for the supervision and direction of the scientific study of the problems of flight. From the laboratories of these nations came scientific data upon which aeronautical engineers came to rely for the design of new planes.

**The Wind Tunnel.**—In studying the forces to which aircraft are subject in flight, mathematics alone is of little help; the dynamics of the air are too complex for reliable results and recourse must be had to experiment. To carry a given weight, how large must the wing be; what speed, shape, angular setting, etc., is needed? How should body and tail surfaces be placed, shaped and positioned for best results? How can speed, range, controllability and stability be predicted accurately prior to construction to ensure satisfactory results? Such are some of the questions of aerodynamicists. These and many others are quickly answered by testing models in a wind tunnel.

Wind tunnels are designed to produce a high-speed, steady flow of air through the test section, or throat, where the model is located. Thus, instead of passing through the air as does the full scale aeroplane, the model is stationary, with the air stream pass-

FIG 3.—THE 24-FT WIND TUNNEL AT THE ROYAL AIRCRAFT ESTABLISHMENT, SHOWING AEROPLANE IN POSITION ON MAIN BALANCE

ing over it, making it relatively easy to explore the airflow streamlines over the model and measure its lift, drag and balancing forces. The model is also arranged so that it can be pitched to various angles with relation to the horizontal air stream; for airfoils this angle is known as the angle of attack.

Wind tunnels are of various kinds, shapes and sizes; small tunnels testing models of approximately ten-foot span at 100 m.p.h. air speeds are available at most aeronautical engineering institutions. Large-scale, subsonic and supersonic speed wind tunnels are mostly available only to government laboratories because of the cost of construction and operation. (*See* also AERODYNAMICS.)

Measurements of model forces in wind tunnels, lift ($L$), drag ($D$), moments ($M$) and centre of pressure ($C.P.$) are usually determined for a complete range of angles of attack and are plotted in the form of airfoil characteristics charts; these are of utmost importance to the aerodynamicist in calculations of the full-scale aeroplane. (*See* Fig. 4.)

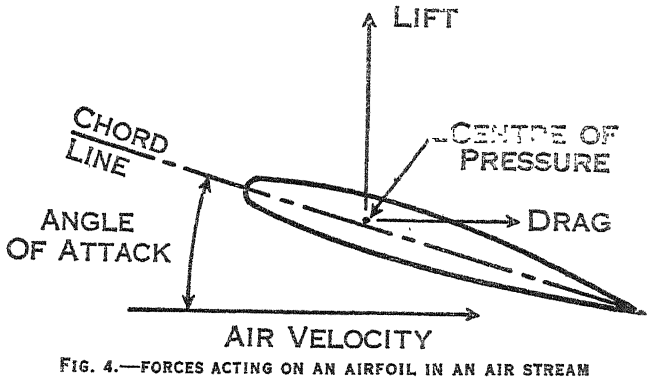

FIG. 4.—FORCES ACTING ON AN AIRFOIL IN AN AIR STREAM

**Airfoil Characteristics.**—"Airfoil section" is the technical name given to the curved-surface cross section of the wing. Its length is the chord ($C$); the width is its thickness ($t$). Airfoil sections have a long history of development from the early flat plate to the modern efficiently cambered sections. Fig. 5 shows the evolution of airfoils.

Variation of shape, curvature of upper and lower surfaces, thickness, shape of nose and trailing edge, all have important and varying effects on the lift, drag, moment and airflow over the wing. For slow-speed planes of 150 m.p.h. or less, thicker sections offer good lift at high angles of attack and permit low landing speeds. They also have ample space for light-weight internal structures. High-speed planes need thinner wings for low drag. Specially designed thin, sharp, nose sections are desirable for supersonic speed planes to offset air compressibility shock problems.

So long as the angle of attack remains constant, the lift, drag and moment are approximately proportional to the product of the density of the air, the square of the speed and the area of the wing on which it acts; so we may write:

$$L = C_L \rho / 2 S V^2$$
$$D = C_D \rho / 2 S V^2$$
$$M = C_M C \rho / 2 S V^2$$

where $C_L$, $C_D$ and $C_M$ are known as airfoil aerodynamic coefficients; $\rho$ is the air density (at sea level 0 002378 slugs per cubic foot), $S$ the area of the wing and $V$ the air speed.

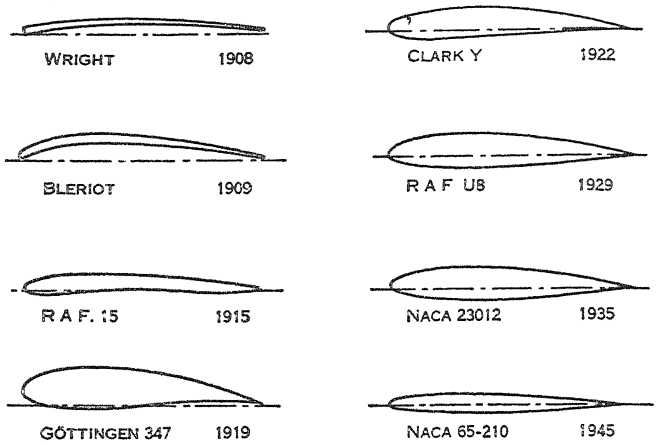

FIG. 5 —EVOLUTION OF THE MODERN AIRFOIL SECTION

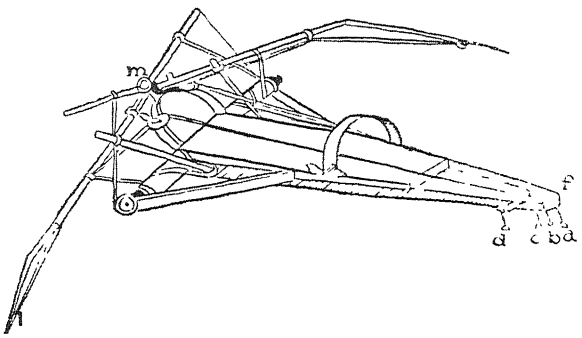
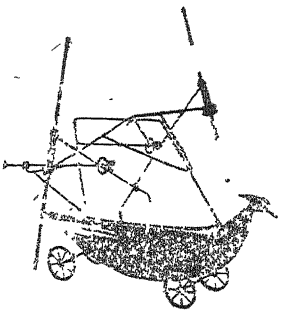
From the wind-tunnel balances $L$, $D$ and $M$ are measured for a range of angles of attack; the three coefficients can then be calculated from the three equations. The results are then plotted in the form of curves, known as airfoil characteristics charts, an example of which is shown in fig. 6.



It is from curves such as these that the weight, speed and other performance characteristics of the aeroplane are computed.

**Scale Effect.**—Before applying wind-tunnel model data to a full-scale plane, scale effect corrections are necessary. Since the full-scale plane may be from ten to many times larger than the model, and since air speeds may be three times or more greater, and air density can vary, how can one step from wind-tunnel results to the actual plane? Dimensional theory shows that, compressibility aside, equivalent conditions are met if $VL\rho/\mu$ (called Reynolds number) of the model and full-size body are equal; where $V$ is the air speed; $L$ is a convenient linear dimension; $\rho$ is the air density and $\mu$ the viscosity coefficient of air. Practically this means that since the model is small, the wind-tunnel test speed must be proportionally increased; for a one-tenth scale model a speed of about ten times the plane speed would be needed. This is impractical but the situation is easily remedied by the application of empirical corrections obtained from a series of tests run on other comparable bodies at varying Reynolds numbers. When such corrections are made to the drag curve, the slope of the lift curve and the maximum lift coefficient, it can be said that conditions for the full-size plane have been met.

**Compressibility Effects.**—As air speeds increase to more than 400 m.p.h., wind-tunnel data must be further corrected for the change in air density resulting from its being compressed at such speeds. The magnitude of corrections needed increase with the ratio $V/v$ (called Mach number, $M$); where $V$ is the plane speed and $v$ is the speed of transmission of sound in air. Experiments show that lift curve slope increases, maximum lift decreases and drag coefficients rise rapidly as the Mach number approaches 1.



At the speed of sound, or $M = 1$, tremendous changes occur to the conditions of airflow around airfoils and bodies. This is called the sonic region. Compression shock waves originate at this speed which produce tremendous changes of lift, drag and moment. By mid 20th century no mathematical theories had yet been developed to predict accurately the exact effects; recourse was made to sonic and supersonic wind-tunnel testing.

**Stalling and Spinning.**—From Fig. 6 it will be noted that as the angle of attack of the airfoil increases, a point is reached where the lift coefficient, $C_L$, suddenly falls; at this instant the plane can no longer maintain flight; its wings lose lift and it must pitch

## NINETEENTH CENTURY EXPERIMENTAL NAVIGABLE BALLOON AND AEROPLANES

1. Stringfellow's aeroplane, built in 1848, the first model aeroplane to fly
2. Bell's patent locomotive navigable balloon, 1850; an early attempt at a semi-rigid dirigible with two hand-driven propellers
3. Thomas Moy's Aerial Steamer, 1874, which was fitted with a 3 h.p. steam engine but succeeded in rising only a few inches from the ground
4. Chanute's Glider, 1903. In experimenting with this and other forms of engineless aeroplanes, Octave Chanute made over a thousand glides without accident

downward with the sensation of falling; it is said to be stalled. All airfoils have this common fault. The violence of the stall, the behaviour of the plane immediately after stalling and the recoverability afterward are of extreme importance. From his knowledge of the shape of the lift curve, the engineer can properly proportion the wing, design twist into the wing, shape the wing tips, sweep the wing and provide stall-warning characteristics as needed to obtain the right stalling performance.

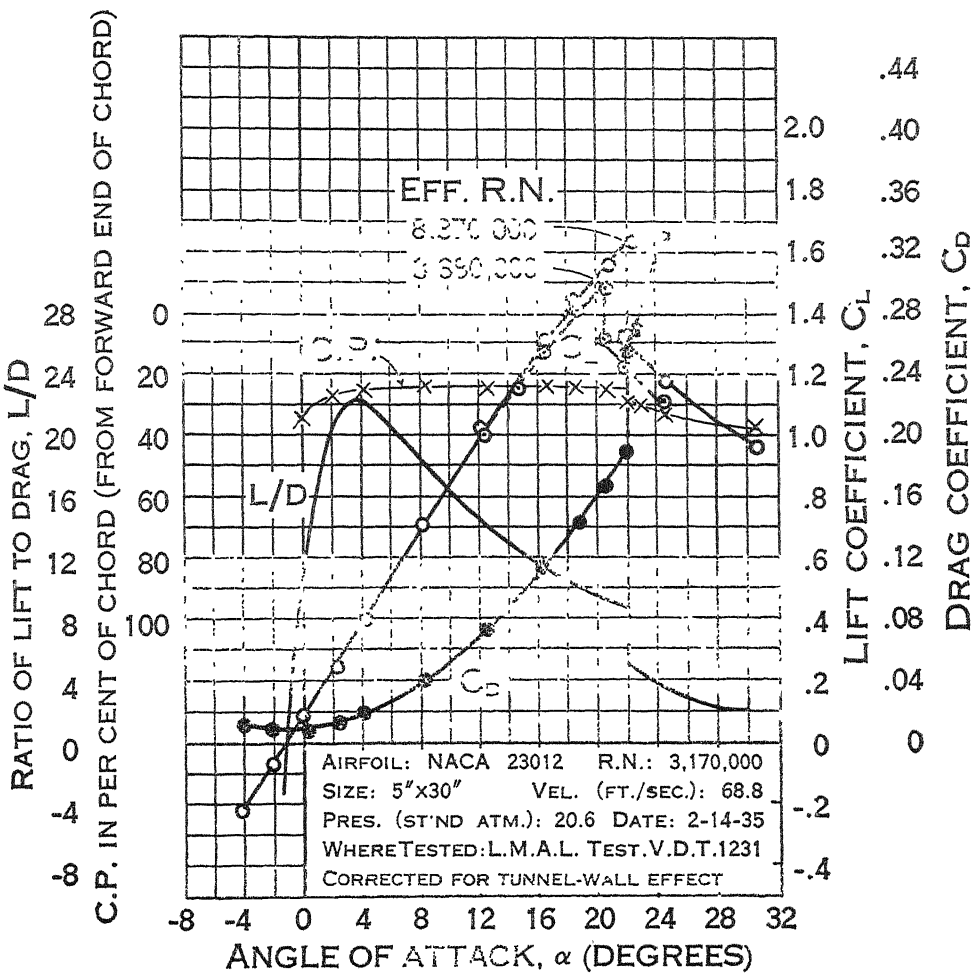
Since a large proportion of accidents arise from stalls close to the ground a well-designed plane will develop an unmistakable warning buffet, or shake, just preceding the stall; it will stall with the nose pitching downward only slightly so that very little altitude is lost and it will not roll to one side or go into a spin. Such a plane is known as "spinproof"

Spins occur after wing stall is reached if the plane is allowed to fall off and roll at the same time. Quickly thereafter it develops into a steady gyrational descending motion about a vertical axis of rotation somewhere ahead of the nose. Altitude is lost rapidly and recovery from the spin must be quickly effected to avert a crash. Many such accidents did occur until it was learned that proper positioning of tail surfaces, their shapes, sizes and locations of control surface were important for good spin-recovery characteristics. Planes can be so designed that they can be pulled out of a spin by simply centring all controls; when rotation ceases, recovery is completed by pulling out of the dive attitude which follows.

**Landing Speed.**—The plane must, on approach to a landing, be slowed down by increasing the wing angle of attack; this is done by pulling back on the elevator control, thus raising the nose. The slowest speed at which the plane can maintain steady flight in this approach is called the landing speed. This speed can be computed from the equation:

$$V \text{ min.} = \sqrt{\frac{2}{\rho C_L \text{ max.}}} \times \frac{W}{S}$$

where $C_L$ max. is the maximum airfoil lift coefficient and $W/S$ is the wing loading; *i.e.*, weight divided by wing area.



It is desirable to have $V$ min. as low as possible for safety reasons; for a conventional light plane where $C_L$ max. is 1.35 and $W/S$ is 12 lb. per square foot the landing speed would be 59 m.p.h.

Reduction of landing speed to a lower value is possible only if $W/S$ is decreased (*i.e.*, decrease the plane's weight or increase the wing area) or $C_L$ max. is increased. The latter is the more feasible, through three means: (1) use of leading edge slots; (2) use of trailing edge flaps; and (3) energizing or removing the layer of air on the top surface of the wing by what is termed boundary layer control. The trailing edge flap is most familiar; however, all these methods, in common, delay the breakdown of airflow over the wing at the normal stall angle so that much higher values of $C_L$ max. can be achieved.

A flap added to the wing of the example above could develop a $C_L$ max. of 2.0 with a resultant drop in landing speed to 48 m.p.h.

**Performance.**—Similarly, other important characteristics of the plane can be computed by using fundamental aerodynamic laws. Space does not permit going into all of these, but a few of the more important performance characteristics so determined are mentioned.

*Speed*—Engine thrust must overcome the total drag of wing, struts, body, tail surfaces, etc. The maximum speed can be computed by equating the power available from the engine to the power absorbed to overcome total drag.

BY COURTESY OF THE NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS

FIG. 6—AIRFOIL CHARACTERISTICS OF NACA 23012 AIRFOIL, SHOWING THE EFFECT OF SCALE ON MAXIMUM LIFT COEFFICIENT AS SHOWN BY CHANGE IN THE REYNOLDS NUMBER

*Climb and Ceiling.*—The excess of power available from the engine over that required for level flight at a particular speed is the amount of energy available for climb, which is the rate at which the altitude is increased, expressed in feet per minute. As the altitude is increased, the rate of climb decreases; at that altitude where it becomes zero, the absolute ceiling of the aeroplane is said to have been reached.

*Range.*—Range can be determined by computing the power required for the given speed of flight times the engine specific fuel consumption (pounds per horsepower per hour) and the quantity of fuel available.

**Stability.**—It is well to consider what is meant by stability as applied to an aeroplane. Imagine that by some means—a sudden downward gust, for example—the motion of the plane is disturbed and the nose takes a downward direction.

If the pilot does nothing to counteract this, one of two resulting actions will occur. In a properly designed aeroplane the nose will automatically rise and after a few successively decreasing pitching oscillations it will, since it is stable, resume level flight of its own accord. Any disturbance in roll or yaw will similarly die out. On the other hand, an unstable machine will increase in oscillation, the nose rising and falling in in-

creasing amplitude, to such an extent as to become dangerously violent. It is not possible here to discuss the conditions necessary for stability; this requires a knowledge of a number of quantities known as stability derivatives which can be determined by suitable experiments in a wind tunnel.

An inherently stable plane will, when set on a course, try to keep it; this is an important characteristic since, lacking stability, safety is impaired, accurate navigational and blind flying impossible and strain of flying on the pilot intolerable.

## THE AEROPLANE

As treated herein, classification and subdivisions under important subject headings are a necessary preliminary for an adequate and brief presentation of the science of design, use and operation of aeroplanes. The separate article AEROPLANE contains a detailed account of many essential design considerations, including flight and performance features.

**Components.**—The essential components of all aeroplanes are: (1) wings or lifting surface; (2) stabilizing and control surfaces; (3) fuselage, or body, housing occupants; (4) propulsion system, engines and propellers; (5) landing gear (*i e.,* wheels, skiis, watertight hulls or seaplane floats); and (6) equipment, instruments and control devices.

The *wings* support the machine. They are carefully designed for minimum aerodynamic drag, good stalling characteristics (*see* above), low landing speeds and use of efficient light-weight structural materials. Steady motion in flight is achieved by a vertical tail surface (*fin*), a horizontal tail surface (*stabilizer*) and the effective *dihedral* angle of the wings. Small hinged planes, operable by the pilot, are attached to the rearward edges of these areas to obtain controllability: a *rudder,* attached to the fin, which guides the aeroplane horizontally; an *elevator,* which causes the craft to dive or climb, attached to the horizontal stabilizer; and *ailerons,* which produce a rolling motion of the craft by changing the angle of the incidence of the wing and are hinged along the rear edge of the wing. When moved, the aileron causes a loss or gain in lift on one wing with respect to the other, thereby allowing the pilot to rock the plane at will. The *fuselage* housing the pilot and passengers is most frequently a shell-like structure resembling an elongated streamline body. It contains the pilot's *cockpit,* which includes all flight and engine controls, radio, instruments and navigation equipment.

The propulsion system (see *Aircraft Propulsion,* below) provides thrust to overcome air drag and thus achieve forward speed.

*Landing gears* are essential for take-off and landing purposes. On land- and amphibian planes they usually consist of wheels and tires mounted at the end of extensible shock-absorbing struts. To reduce air drag it is customary to retract landing gears into the body or wings in flight. On flying boats and seaplanes the bottom surface of the landing structure is carefully shaped and proportioned to provide good hydrodynamic characteristics as regards handling and control characteristics, absence of tendency to porpoise and minimum "hump" speed; *i.e.,* that speed where the hull rises in the water, its resistance drops rapidly and skimming on the water surface is started.

**Types of Aeroplanes.**—Aeroplanes are customarily described with reference to operational use, wing arrangement, propulsion means, type of landing gear, etc.

*Landplanes* operate from airports, *seaplanes* and *flying boats* from sheltered water areas; *amphibians* operate from either water or land but have retractable landing wheels making it possible for the pilot to take off and land on water or an airfield. Skiis are sometimes installed on landplanes to convert them to *skiplanes* for operation on snow and ice. *Tricycle*-type landplane landing gears have a front wheel located on the nose of the fuselage, allowing the aeroplane to remain in a level attitude on the ground. A *tail-wheel*-type aeroplane uses a wheel at the tail end of the fuselage requiring the plane to be in a "tail-low" attitude while at rest.

Aeroplanes with one main wing are called *monoplanes;* two wings, one above the other, *biplanes.* A tailless monoplane is called a *flying wing* *Canard* monoplanes have the tailplane ahead of the main wing. The location of the monoplane's wing vertically with respect to the fuselage designates it as a *low-wing, mid-wing* or *high-wing,* the mid-wing having the wings so attached to the fuselage as to seem to pass approximately through the middle

Aeroplanes are either *propeller driven* or *jet powered* Single-engine planes have one engine, usually in the nose of the fuselage Multiengined aeroplanes employ two or more engines, disposed symmetrically on each side of the fuselage.

**Development and Utility.**—Space permits only a brief treatment of some major factors governing the development and use of modern aeroplanes Four essential elements are considered (1) safety; (2) speed and comfort; (3) reliability of service; and (4) special purpose. A discussion of each follows.

*Safety.*—Aeroplane designers are acutely conscious of safety requirements, calculations and thorough strength testing of all structural components are conducted for the maximum possible air and landing loads. Numerous tests are made of power plants, control systems, instruments, pressurization systems, fire detection and control procedures, etc. Finally, thorough flight tests are completed to prove the safety and reliability, even to the extent of simulating emergency conditions such as failure of vital control systems, loss of engines and entry into icing conditions.

Air-line operators also have thorough training and check-up programs to ensure the competence of pilots, flight engineers, navigators and mechanics. A continuous system of inspection, overhaul and replacement of critical components of the plane is maintained.

*Speed and Comfort.*—Higher operational speeds are sought, without sacrificing economy of fuel and sizable pay load. To do this, care is used in selecting the engine and propeller; thin wings and well-streamlined smooth bodies and surfaces are used to obtain minimum drag. Equipment must be compactly stored within the structure. Since low landing speeds are needed, high lift flaps are placed on wings to reduce the stalling speed.

Comfort and safety of passengers is achieved through pressurized cabins, high-altitude flying in smooth air, soundproofed compartments, comfortable chairs, safety belts and many other features.

*Reliability of Service.*—Reliability of modern aircraft engines, structures and equipment is such that delays to scheduled trips resulting from mechanical difficulties are rare. Poor visibility and bad meteorological conditions of storms and icing, however, were still real handicaps at mid-20th century. "All-weather" equipped aeroplanes and a world-wide system of aerial highways using radio devices for guiding pilots (and later automatically directing aircraft) were being developed. Blind flying instruments for control and trim as well as ice-removal equipment to keep engines, propellers and wings free of ice had become essential. Radio beams and electronic instrument landing systems were available to guide aircraft and make possible safe landings with cloud ceilings of 200 ft. and visibility of one-fourth mile.

*Special Purpose.*—Aeroplanes are designed to accomplish definite tasks, such as transportation of people and cargo, aerial survey and mapping, agriculture and forestry uses and military applications. The form, arrangement of body, proportioning of wings and control surfaces, number of and type of engines, are all dictated by the ultimate purpose of the particular design. People must be enclosed in comfortable heated and ventilated compartments. Cargo must be carried in compartments having large external openings and heavy floor structures. Camera installations and clear-view windows must be provided for aerial mapping work. Dispensing hoppers and spray equipment are specially designed for use in aerial-seeding and pest-control planes. Military aircraft have special design requirements of high strength for manoeuvrability at high speeds and extreme altitudes; bombers, fighters, training, observation and liaison planes all are designed under specialized requirements to make them suited for specific use.

**Private Planes.**—Great improvements were made in the design of small planes to accomplish low landing speeds, eliminate stalls and spins, simplify flying by use of two controls (*i.e.,* elimination of the rudder and use of a wheel for elevator and aileron control) and improve landing gears to simplify ground taxiing by use of a steerable tricycle landing gear. Research was undertaken to im-

prove the speed range; *i e*, increase cruising speeds to more than 150 m p.h and reduce landing speeds to less than 50–60 m p h. Combination aeroplane-automobiles, in which wings could be detached, were also designed.

The fuselage structure of most modern private planes is either of welded steel tubing covered by painted or doped fabric or of riveted thin sheet aluminum alloy construction. Plywood and spot-welding metal construction have also been used Wings may be constructed of wood or metal spars. Internally, ribs of a truss shape are attached, having the form of the wing airfoil The complete structure is covered with doped fabric sewn to the ribs, or a thin sheet, or skin, of aluminum. In single-engine aircraft, small four- to six-cylinder air-cooled engines of approximately 100–150 h p. are used, requiring 6–12 gal. of fuel per hour to operate. Propellers may be of wood or metal.

**Commercial Air-Line Planes.**—Table II includes general information on some of the most familiar air-line transport aircraft at mid-20th century. Approximately five years of intensive engineering development and testing are required to produce a successful modern transport. Since economic competition exists with railroads, buses and ships, low operating costs per mile flown are essential. Pay load (number of passengers or weight of cargo) must be as high as possible.

Special emphasis is given in design to safety aspects of structure, power plants, equipment and radio components. Multi-engines are desired to ensure safe arrival at emergency landing fields in the event of failure of one or more engines. Special procedures to detect and extinguish fires are developed. Automatic pilots and other controls, and thermal heating of wings and vulnerable icing areas are provided to make flying safer and easier Hydraulic, electrical and mechanical controls, equipment and instruments are duplicated for safety reasons. To shorten landing runs and conserve brakes, reversing pitch propellers are employed.

## ROTATING WING AIRCRAFT—GYROPLANES, HELICOPTERS

For centuries inventors had sought to develop wingless heavier-than-air flying machines using the principle of horizontally rotating propellers or the like. The attractive possibility of achieving hovering flight, a distinct advantage over fixed-wing aeroplanes which require long runways for take-offs and landings, stimulated inventors, but failures were the rule until about 1920, primarily because engines of sufficient power and low weight were unavailable.

**Gyroplane.**—In the 1920s, in Spain, Juan de la Cierva created the Autogiro, a strange-looking machine somewhat like a monoplane with a four-bladed rotor mounted on a central pylon and rotating horizontally above the fuselage. The engine-propeller installation on the front of the fuselage operated as on a conventional aeroplane. The lifting power of the rotor, which supported the aircraft in the air, was derived solely from the motion of the blades of the rotor as it moved edgewise through the air. The rotation was automatically achieved as a result of the air's passing upward past the individual blades, creating, in part, on each a horizontal, forward-acting force which tended to increase the rotational speed of the blade; hence, the terms "autorotation" and "autogiro."

This principle was exploited in various gyroplane developments with moderate success by later inventors in the United States and England. However, the advantages of these craft over conventional aeroplanes, particularly with respect to load-carrying ability, power requirements and speed, were insufficient to ensure commercial acceptance. More important, gyroplanes, incapable of hovering flight, were overshadowed by the advent of the helicopter.

**Helicopter.**—This type of aircraft is characterized by one or more horizontally rotating rotors directly driven by the aircraft engine. It has no wings. In free flight it can move at will in three dimensions: vertically, forward or backward, and sidewise. Each rotor usually consists of two, three or four separate blades extending radially from a central axis of rotation, or hub. The angle of attack of each blade can be changed at will by the pilot through movement of either of two levers, called the "collective

pitch control" and the "cyclic control." Movement of the collective pitch lever results in the helicopter's ascending or descending; the cyclic control changes the plane of rotation of the rotor in the direction desired by the pilot—thus controlling forward, rearward and sideward motion.

One serious engineering problem concerns the counteraction of the engine torque force reaction arising from driving the rotor; unless counteracted by an oppositely applied torque capable of being varied by the pilot at will to suit the complete range of engine power, the effect would be to rotate the helicopter body in an opposite sense of the rotor rotation. A small auxiliary tail rotor, similar to the aeroplane propeller, mounted vertically on the rear of the fuselage and driven by a long drive shaft from the engine, is commonly used on single main rotor-type helicopters to provide antitorque forces. The tail rotor incorporates a blade, variable pitch-control mechanism operable by the pilot using conventional rudder pedals; the pilot can thus rotate the helicopter completely through 360° by this means while hovering. When more than one main rotor is used on the helicopter, such as in tandem, coaxial and other multirotor arrangements, the unfavourable engine torque effect can be effectively eliminated by causing each rotor to rotate in opposite directions.

Helicopter rotors are designed to continue rotation automatically in the event of engine failure, permitting safe descent and landing in small areas. This feature plus good speed range from zero to much more than 100 m.p.h., good lifting or pay load capacities and ability to operate from small areas, even rooftops, made the helicopter suitable for aerial taxicab and short-haul operations.

## AIRCRAFT PROPULSION

Early attempts to fly failed or met with poor success because of inadequate knowledge of the power necessary and the lack of suitable engines. Steam was used by Phillips (1842), Henson (1842) and Stringfellow (1848) to drive models. Manly developed a small steam engine of 60 oz. which developed one horsepower; the four boilers weighed 7 lb. each. He later built the 52-h.p., five-cylinder gasoline engine used by Langley (1903). In 1894 Maxim devised a pair of two-cylinder compound engines, each weighing 600 lb. and giving 363 h p.

Steam power was then dropped and the problem changed by improvements in the internal combustion engine burning gasoline Santos-Dumont (1906) used a light and (for the time) powerful gasoline engine; about one year later Farman used an eight-cylinder Antoinette engine developing 40 h p. at 1,100 r.p m.

In 1908 Wilbur Wright, in his notable flights in France, employed a four-cylinder gasoline engine of 24 h p., making 1,200 r.p.m. and connected by chain gearing to two wood propellers which revolved at 450 r.p.m. The weight of the motor was stated to be 200 lb.

From this time on progress was rapid. At first engines cooled by liquids, water or Prestone were used extensively but being heavy, and susceptible to failure because of leaks, were dropped in favour of air-cooled types.

Modern air-cooled aircraft radial engines of the reciprocating type were perfected to the point that power outputs of one horsepower per pound and fuel consumptions of 0.45 lb. per horsepower per hour became ordinary. Powers of from 50 to 3,500 h.p. were available. (*See* AERO ENGINES for other details.)

**Types of Engines.**—Aircraft engines were perfected along the following general lines: (1) reciprocating engines; (2) gas-turbines (turbojets) and (3) other reaction engines. Tables III and IV present typical characteristics of the first two types. Turbojets are also a form of reaction engine.

Reciprocating engines employ cylinders with moving pistons which, under the pressure of exploding fuel-air mixtures in the cylinders, rotate a crankshaft to produce power. Engines with cylinders located behind one another are called "in-line" engines. Radial engines have the cylinders disposed in a circle radially from the crankcase. The radial engine has the advantage of short length and compactness but presents a problem because of its large frontal area, requiring careful cowling to reduce drag and provide cooling.

Gas-turbine engines were a development of World War II. They consist of three essential components: (1) a compressor to

TABLE IV.—*Data on Gas-Turbine Engines*

provide high density air at high speeds; (2) a burner into which fuel is injected and burned with the compressed air; and (3) a turbine wheel which is rotated by the action of the expanding, hot, high-velocity gases on its blades. In turbojet engines the turbine supplies power to operate the compressor; thrust is obtained by means of the reaction pressure of the hot expanded, high-velocity gas as it escapes through the tail pipe of the engine. A turboprop engine is fitted with a frontal propeller driven by the turbine shaft through a gear reduction transmission in order to reduce its revolutions per minute; jet thrust from the escaping gases is also available. Gas-turbine engines are especially efficient for propelling high-speed, high-altitude planes. Low-grade fuels can be used, such as those having a kerosene base or low-quality gasoline.

All reaction engines develop thrust through the reaction force of hot gases expanding from a combustion chamber. In addition to gas turbines, other examples of reaction engines are pulsejet, ramjet and rocket engines. They have few or no moving parts and find application for driving aircraft at extremely high speeds by developing tremendous power; fuel consumption is enormous. Fuels are either liquids or solids; ordinary gasoline, alcohol and liquid oxygen and solid combustibles are typical propellents.

**Engine Requirements.**—The discussion which follows pertains primarily to air-cooled reciprocating engines.

The compelling objectives of engine research and development are to obtain a maximum of thrust for a minimum of frontal area, engine weight and fuel consumption. Steel as well as light, strong alloys of aluminum and magnesium are employed for construction of crankcase and pistons. Resistance to high temperature is needed. Special high-strength alloy steels are used for gears, crankshaft, valves, etc. Cylinder barrels and cylinder heads are air-cooled by using a large number of closely spaced fins around their outsides; cooling air, under pressure from high speed, is forced around such parts by cowling and baffles which fit closely around the outside of the engine. The cowling also forms a streamline body enclosing the engine and reducing air drag to a low value. Cowl flaps or gills, adjustable by the pilot, control the amount of air passing over the engine; these can be opened wide on the ground, where maximum cooling is needed, and adjusted in the air so as not to cool the engine excessively under low temperature conditions.

Two spark plugs are used for each cylinder to increase reliability and obtain greater combustion efficiency. Intricate carburettor and fuel injectors which have automatic altitude compensation devices for maintaining proper fuel-air mixture ratios are installed; otherwise, as the air density falls with altitude, the flow of fuel would be excessive. Again, with increasing altitude, the power output of the engine falls off because of the reduced density of air and the resultant reduced mass of air drawn into the cylinders for combustion; superchargers, in the form of blowers or compressors, are provided to compress the air fed to the cylinders to make up for this deficiency. As a result, a typical supercharged engine, which develops a normal power of 1,070 h.p. at sea level, provides 1,100 h.p. at its critical altitude of 7,000 ft.

By increasing the compression of the cylinders, a large increase in power output is possible, but too great a compression produces detonation-knocking in the engine. This condition is detrimental to the engine. Special fuels with good detonation characteristics, identified as high-octane fuels, are available to reduce the severity of knocking. Still further improvement can be attained, especially during high-power take-off conditions, by injection of water directly into combustion chambers. This cools the hot gases somewhat, thus suppressing detonation, and allows higher powers to be drawn for the short time needed at take-off.

**Performance and Operation.**—Important to the designer in determining speed, range and performance of aircraft are the engine performance charts. These are in the form of carefully prepared curves showing the engine power output under varying conditions of revolutions per minute, intake (or manifold) pressure and atmospheric pressure (altitude effects) based on standard air conditions. Data of this nature are carefully prepared from engine-dynamometer test data. Information on the fuel and oil consumption characteristics are also obtained.

Engines must be carefully controlled and operated in order to obtain maximum efficiency, range and dependability. In addition to the throttle, there are many other controls and instruments such as manifold pressure gauges, tachometers (revolutions per minute indicators), oil pressure gauges, temperature gauges and controls, fuel mixture controls and propeller pitch controls.

In addition to furnishing power for propulsion the engine also drives accessories such as fuel and hydraulic pressure pumps, electrical generators and air compressors.

**Propellers.**—The use of propellers to provide propelling thrust for marine craft and aeroplanes has long been familiar. In principle, thrust is obtained by imparting momentum to the column of air which passes through the propeller disk. The larger the disk area, the greater the pitch of the blades, and the higher the revolutions per minute the greater the amount of thrust force produced.

Important considerations to designers are the thrust, power and efficiency of a propeller. To determine such factors it is possible to apply simple laws of aerodynamics, since, in effect, the propeller is an airfoil moving in a curved path, thus developing lift and drag forces similar to those of a wing. In level flight, propeller thrust must equal the total air drag of the plane. The power delivered by the engine must equal that required to overcome the torque of the drag forces of the propeller. The efficiency of conversion of engine power to useful work is measured by the ratio of thrust horsepower to engine horsepower; values of propeller efficiencies of 85% are usual at cruising speed.

Propellers consist of blades and a hub, which may be of one-piece laminated wood construction, or of separate blade and hub construction; in such cases blades of wood, solid aluminum alloy or hollow steel materials are used.

Two general types of propellers are employed—fixed pitch and variable pitch; here, pitch refers to the angular setting of the blade with reference to its plane of rotation. A fixed pitch propeller can provide maximum efficiency at only one value of air speed to revolutions per minute ratio. A "best efficiency" propeller is one where the pitch can be continuously increased from low pitch at take-off speed, where large thrust is desired, to high pitch at high speed. Modern transports are equipped with such variable-pitch propellers; the hub encloses the complete pitch change mechanism, using either an electric motor or hydraulic actuator, and a constant speed governing mechanism which automatically maintains the engine revolutions per minute at the value selected by the pilot.

Two-, three- and four-bladed propellers are used. All propellers have an undesirable torque reaction which tends to cause the plane to roll; correction must be provided by adjustment of aerodynamic forces. Dual-opposite rotating propellers were developed to correct the condition but were not used extensively since torque reaction can usually be overcome adequately by less complex means.

Propellers are limited as to size and air speed. Physical limitations of ground and body clearances limit diameters. Propellers adequate to absorb more than 3,500 h.p. were developed. At extreme high speeds, approaching the speed of sound in air, propeller efficiencies deteriorate rapidly; hence, it seemed that their use would be confined to subsonic speed aircraft. For the same reason the rotational speed is limited to keep propeller tip speed within reasonable values.

Propeller icing can be prevented by alcohol deicing or by electrical heating elements.

"Feathering" of propellers to a 90° pitch position reduces air drag in the event of an engine failure, thus making flight with the remaining engines easier. Full reversal of pitch, as mentioned previously, allows application of rearward thrust while on the ground, thus providing an added safety feature to shorten ground roll on landing, the propeller serving as an air brake.

## NAVIGATION

For clear-weather flights (visual or contact flying), orientation

and navigation are relatively simple and can be accomplished by reference to the ground, use of magnetic compass and air maps. For blind flying, however, where ground, sun or stars are invisible, elaborate instrumentation is necessary. Instruments can be grouped into four main categories: power plant, flight, navigation and landing.

**Power-Plant Instruments.**—These tell the pilot that the engines are being properly operated. They include the tachometer, for showing engine speed, pressure gauges for intake manifold, fuel, vacuum and hydraulic pressure, temperature indicators for motor, oil, carburettor and outside air temperatures, electrical gauges and fuel quantity indicators.

For multiengined aircraft these gauges are duplicated, one set for each engine.

**Flight Instruments.**—The purpose of such instruments is to indicate that the plane is being correctly and safely flown. Airspeed indicators show the speed and warn against flying too slowly (to avoid stalls) and too fast for structural safety. Machmeters indicate nearness to speed of sound, which varies with altitude. Altimeters indicate height of flight to aid the pilot in preventing collisions. Rate of climb instruments indicate ascent, descent or level flying.

The attitude of the airplane (*i.e.*, roll or pitch condition) is indicated by means of gyroscopic instruments which show the amount of bank and pitch in degrees from the normal attitude. Turns about a vertical axis are indicated by other similar instruments.

Many variations of gyroscopic instruments are used; the simplest is the turn and bank indicator. Others are stabilized magnetic direction indicators, free type directional gyros, artificial horizons and attitude gyro indicators. All these instruments incorporate a high-speed rotating wheel mounted in gimbals, which substantially maintains a fixed "reference" plane of rotation irrespective of disturbance to the plane. The gyroscope principle is incorporated into automatic pilot sensing controls to achieve controlled flight.

**Navigation Aids.**—The pilot needs guidance in the air so that he can set his course to his destination. Common magnetic compasses are inadequate, except for ground contact flying, since they are easily disturbed in rough air, are subject to many errors and can indicate only direction of heading and not location. Radio means are therefore used extensively for navigation under instrument conditions. Radio waves projected along invisible "airways" guide planes along a radio "beam" to the airport. Morse code transmission of two letters, –A and N–, tell the pilot if he is off course to the right or left by the letter he hears. Because of traffic congestion and poor reception under heavy static conditions, this system was being replaced at mid-century by very-high-frequency, omnidirectional radio ranges called VOR. The pilot sets his course on an indicator and can fly cross country by reference to a vertical pointer.

**Landing Instruments.**—Under clear weather conditions, approaches to airports and landings can be made easily by the pilot without the aid of special instruments. Radio devices are needed, however, under bad visibility conditions, to help locate the airport, line up with the proper runway, descend and make ground contact safely.

Two systems are used: one in civil aviation called instrument landing system (ILS) and the other ground controlled approach (GCA), a radar device. ILS consists of three radio aids: (1) a radio beam, the localizer, which guides the pilot right or left as he lines up to approach the runway; (2) a glide path, which guides him down at a safe angle from a point about 3,500 ft. from the end of the runway; and (3) an aid which consists of three marker beacons along his path, telling him his distance from the end of the runway (3 mi., 3,500 ft. and the end of the runway). In the GCA system, the plane is pictured as a "blip" on a radar screen in the control tower, and the radar operator informs the pilot of his position with respect to his right and left path and his position above or below the glide path.

The final landing is made visually after "breaking out" of the bottom of the cloud layer, usually not less than 200 ft. The final aid to the pilot consists of high-intensity approach lights which lead him to the approach end of the runway and give visual guidance.

Automatic control devices are under development to accomplish the above approach to landing automatically; otherwise, in the ILS the pilot must do this manually by observing instruments. (*See* AERIAL NAVIGATION.) (B. L. S.)

**AEROPLANE.** The main problem that confronts the designer of any means of transport is to find a working compromise between the various demands of those who maintain and use the service. There is no conflict between the interests of the operator and those of the user. Their common requirements are safety, speed, comfort and adherence to a published timetable. As regards both safety and reliability, improvements in radio, the establishment of radio beacons, the installation of deicing apparatus, tremendous forward strides in instruments and aeroplanes, and improvements in operating facilities had great effects.

The cost of air transport by mid-20th century was comparable to first-class rail and ship accommodations Time saving and ease of travel were evident from the ever-increasing passenger traffic

For reasons which are explained in the article AERODYNAMICS a normal aeroplane cannot be maintained in flight at a speed *less* than a certain minimum "stalling" speed, which for a modern commercial aeroplane varies between 40 and 110 m.p.h. On the other hand, it is possible to give it enough engine power to drive it at between 90 and 400 m.p.h., while leaving a margin of some 20% of its total weight for passengers or goods. The aeroplane's permanent way, the air, is the only medium of transport which connects without interruption all places on the globe. It may be anticipated that the consequent possibility of transit free from the necessity of making transfers may prove to be as valuable as the speed which can be maintained.

From the point of view of design, with which this article deals, *safety* is discussed below; *comfort* is comparable to that of other types of travel and in the opinion of many, air travel furnishes superior comfort; and *reliability* (in so far as it depends on design) presents no special problems.

In what follows we shall discuss (1) the *Minimum Speed of Flight* and its influence on the design of aeroplanes; (2) the *Power Required for Flight,* including both that necessary to drive the aircraft through the air and also—the unique feature of transport by aircraft heavier-than-air—that expended in sustaining it in flight; (3) the possibilities of *Improvement of Performance* by reduction of resistance; (4) the *Origin of Aerodynamic Data of Design;* (5) the *Distribution of Weight* among the component parts; (6)

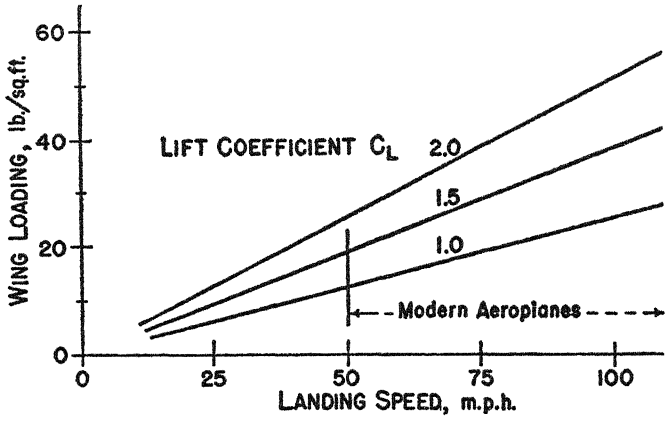

FIG. 1.—DIAGRAM SHOWING HOW THE LANDING SPEED VARIES WITH WING LOADING, W/S, AND LIFT COEFFICIENT, $C_L$

the *External Form of Aeroplanes,* commenting on the most conspicuous features of modern aircraft; (7) *Stability and Control* and their influence on (8) the *Safety of Air Travel;* concluding with notes on (9) *Structural Design* and (10) *Materials used in Construction.*

### 1. MINIMUM SPEED OF FLIGHT

It is the impossibility of steady flight *below* the stalling speed

that constitutes the chief danger of air travel. Many attempts have been made to avoid this source of danger by devising an aeroplane which would be capable, as a whole, of remaining stationary in the air. Such machines have generally employed either flapping or rotating wings, the so-called ornithopters (*q.v.*) and helicopters (*q.v.*). The former have shared the legendary fate of Icarus. The latter, however, were proved possible of construction and flight. By mid-century they were performing many useful services in commercial and military aviation. (*See* GYROPLANE.)

There is no fundamental obstacle to reducing the minimum speed of a normal aeroplane to about 25 m.p.h., instead of the 40 to 110 m.p.h. quoted above as typical of modern practice. In fact, the earliest flying machine had minimum speeds of this order. But the general proportions of such a machine would be uneconomical from every other point of view. In particular, almost the whole of the available weight would be absorbed by the structure and power plant, leaving no margin for paying load.

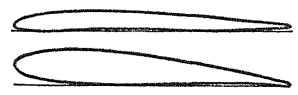

FIG. 2.—CROSS SECTIONS OF RECENT TYPES OF AEROPLANE WINGS

The relation between the total weight ($W$ lb.), the area of the wing ($S$ sq.ft.) and the aerodynamic coefficient ($C_L$) which determines their lift at any given speed ($V$ ft./sec.) (*see* AERODYNAMICS) is

$$W = C_L S \frac{\rho V^2}{2},$$

$\rho$ being the density of the air.

This may be put, for standard sea level air density, in the form

$$V = 19.8\sqrt{\frac{w}{C_L}} \text{ m.p.h.},$$

where $w = W/S$ and is called the wing loading, in lb./sq.ft. Fig. 1 shows the relationship of $w$, $C_L$ and landing speed. Fig. 2 shows the cross section of a vertical plane parallel to the direction of flight of some modern wing sections. For these the maximum value of $C_L$ (which in virtue of the above relation corresponds to the minimum flying speed) is between 1.1 and 1.5 for a plain wing. Modern commercial aircraft using such wings have loadings from 9 to considerably more than 50 lb./sq.ft. In the latter case from fig. 1, using $C_L = 1.5$, a landing speed considerably greater than 100 m.p.h. would be evident (to be exact, 114 m.p.h.). This is too great for safety except on quite large airports; reduction can be made in two ways: (1) by reducing wing loading or (2) by seeking aerodynamic means for increasing $C_L$. The former course leads to a reduction in the pay load. Much attention was therefore devoted to the latter method.

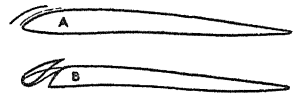

FIG. 3.—CROSS SECTION OF THE HANDLEY PAGE SLOTTED WING. WITH IT THE MAXIMUM LIFT COEFFICIENT CAN BE INCREASED ABOUT 50% OR MORE

FIG. 4.—METHOD OF VARYING THE CURVATURE OF THE WING. IN GENERAL, THE GREATER THE CURVATURE THE HIGHER IS THE MAXIMUM LIFT

A most effective high lift wing section is the "slotted" wing of Handley Page Ltd. (fig. 3). With this the maximum lift coefficient can be increased about 50% or more. The action of the device is, broadly speaking, to cause the flow characteristic of stalling (*see* AERODYNAMICS) to occur at a larger angle of incidence.[1] The increase in lift is dependent on the relative position of the main and auxiliary wings; *i.e.*, on the size and shape of the slot between them, which can be varied in flight. With the slot closed the characteristics are nearly the same as those of a normal wing. In this respect form (a) (fig. 3) is superior to form (b), but in practice there are, with both, constructional difficulties in the way of ensuring a smooth and unbroken surface when the slot is closed.

Another method which has been widely used is to vary the curvature, or "camber," of the wing (fig. 4). In general, the greater the curvature of a wing section the higher is the maximum lift, but the lower the efficiency at high speeds. This device attempts to secure both high lift and high efficiency by enabling the pilot to alter the curvature to suit the conditions of flight. The increase of lift attainable in this way is comparable to that achieved by the slot. By combining both these methods very high maximum lifts have been obtained. However, because of icing difficulties and mechanical complications this combination does not find much use; instead, other means of increasing lift were adopted.

A variation of the system of changing the camber is the use of flaps. Their use is now standard on the majority of air liners, having been necessitated by the greatly increased speeds. The increase in high speed and in cruising speed has inevitably increased the stalling speed and thus the landing speed. The employment of flaps has kept the landing speed at a practical figure. The use of flaps on the take-off also increases the lift and makes shorter take-off possible at the expense of speed. They are constructed by hinging the undersurface of the trailing edge of the wing in such a manner that the trailing edge may be opened by forcing down the undersurface by a system of control from the pilot's seat for landings and take-offs. Flaps were developed of several types, including a variation where the flap is extended rearward, using a system of linkage, and then deflected. Lift increase at stalling speed of as high as 100% was achieved, including the effects of propeller slip-stream velocity.

### 2. POWER REQUIRED FOR FLIGHT

Aerodynamic equations for drag and power required are usually expressed

$$D = C_{D_T} S \frac{\rho V^2}{2}$$

$$P = DV/550 \text{ h.p.},$$

where $C_{D_T}$ is the drag coefficient for the complete aeroplane, $S$ the wing area in square feet and $V$ is the air speed in ft./sec.

When an aeroplane of conventional design is flying horizontally (in air of a given density) the power of the engine is disposed of in the following ways: (1) About 15% is lost because of inefficiency of the propeller. (2) From 30% to 50% is used to overcome the air resistance of the body, including the engines, undercarriage, tail surfaces and other exposed body parts. (3) From 55% to 35% is similarly absorbed by the resistance of the wings. The large differences between the alternate values of (2) and (3) are caused by variations of speed, relative size of body compared with the wing, number of engines and type of aeroplane. As indicated by the formulas, the resistance of parts varies practically as the square of the air speed and the corresponding power as the cube thereof.

The aeronautical engineer, taking into account the above relationships between engine power and how it is absorbed by the aeroplane components, can prepare power characteristics charts for the plane. Fig. 5 shows this power relationship in simplest form. As speed increases the power required also increases rapidly from its lowest value at low speed. Note also that the power available from the engine increases likewise. Where these two curves intersect and the powers are equal, then the *high speed* in level flight is attained.

Fig. 5 also shows the relative effect of altitude on the power curves. It will be noted that there is a general increasing of power required and a lessening of power available. When that altitude is reached where the power available curve is just tangent to the power required curve, then the *absolute ceiling* has been reached.

Returning to the total resistance of the wings (3), this is divided by aerodynamicists into two parts, the *profile drag* and the *induced drag*. At high air speeds the profile drag can account for as much as 75% of the total. It is derived from the friction of air on the surface of the wing transmitted through a very thin layer of air (called the *boundary layer*) and from turbulence or *eddies* occurring aft of the wing trailing edge downstream.

The profile drag coefficient ($C_{D_P}$) increases only slightly as the wing angle of attack increases. Also, the thicker the wing airfoil section the higher $C_{D_P}$ becomes.

The induced drag accounts for from 25% to upward of 60% of

[1] Angle of the chord to the longitudinal axis of the aeroplane. The chord of the wing sections in fig. 2 is indicated by a straight line.

the wing drag (*see* AERODYNAMICS; the *induced* drag of L. Prandtl). This arises from the rearward component of lift generated by the wing; for a given lift force it varies inversely as the square of speed and wing span. Large span wings are, therefore, most suited for slow-speed aircraft, or gliders, where low induced drag is sought.

The merit of separation of the aeroplane's total drag into various elements is evident since it allows the designer to examine the economics of each and to determine which will provide most fruitful benefits, if improved.

By referring again to fig. 5 other important considerations can be revealed. For example, flying at the maximum speed. using full engine power, is uneconomical from the point of view either of the life of the engine or fuel consumption. Reducing engine throttle to power outputs of about 60% to 75% maximum is more economical; the resulting speed is called the cruising speed.

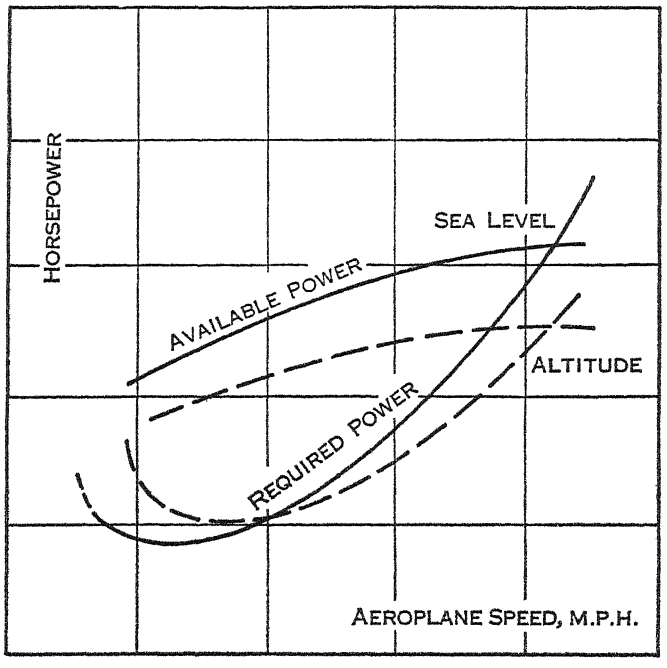

FIG. 5.—TYPICAL VARIATION OF POWER CURVES FOR AN AEROPLANE SHOWING THE RELATIONSHIP OF POWER AVAILABLE FROM THE ENGINE TO THAT REQUIRED FOR FLIGHT, AT SEA LEVEL AND AT ALTITUDE

The difference between the maximum power available and power required curves, at a given air speed, is called the excess horsepower. This is the amount of power available for rate and climb, expressed in ft./min. The speed for *best climb* is that point where the excess power is largest; *i.e.*, somewhat higher than that where power required is a minimum. Rates of climb can vary from 300 ft./min. for small planes to more than 8,000 ft./min. for jet-powered aircraft.

### 3. IMPROVEMENT OF PERFORMANCE

**Propeller (Airscrew) Efficiency.**—A loss of between one-quarter and one-third of the power of the engine in the transmission assembly would hardly be tolerated in road or rail transport. Transport by water, however, is burdened by a loss identical in character and similar in amount. It arises from the fact that the propulsive force is obtained by driving a fluid backward. This condition cannot be entirely overcome, but propeller efficiency can be and is being greatly increased. Commercial aeroplanes have an altitude operating range from sea level to 25,000 ft. At 15,000 ft. the air density is approximately half that at sea level. Further, the plane's speed varies from zero at take-off to any value up to its maximum speed. A constant pitch propeller obviously will not operate at highest efficiency throughout these variable conditions. If it is designed for high efficiency at the surface, where maximum power is desired for take-off, it will have low efficiency at normal cruising altitudes and speeds. Resort is therefore made to adjustable pitch, controllable pitch and automatic propellers. The first is adjustable on the surface with motors dead. The second is controllable by the pilot while in flight. The last is automatic. All these types became standard equipment. (*See* AIRSCREW.)

**Jet Propulsion.**—For very high altitudes, 40,000 ft. or more, and extreme high speeds the propulsive efficiency of the propeller and the power output of the reciprocating engine drops to such low values as to become uneconomical. Here the jet engine becomes superior from both standpoints. In the rarified upper atmosphere the compressor turbine of the jet engine boosts the pressure of the inlet air, thus increasing the quantity of intake oxygen to burn with the fuel. Thrust is obtained as a result of the reactive pressure of the expanding hot, high-velocity gases released through the tail pipe of the engine. Because of its small frontal area and low cooling loss compared to reciprocating engines (energy lost as a result of cooling cylinders) much lower air drag is realized which adds further to its advantage. At low air speeds, such as at take-off, the jet turbine is quite inefficient; as a result, high speed and altitude must be reached quickly to conserve fuel. In a typical 3,000-lb. thrust jet engine as much as 400 gal. fuel per hour may be burned at cruising speed.

**Resistance of the Body.**—In modern aeroplanes body drag must be kept to a low value. All possible equipment and parts are stored within fuselage and wings. The junction of fuselage and wing is carefully filleted, windshields are placed at proper angles, the shape of the body is carefully planned and its exact positioning on the wing designed to give lowest air drag when the wings are at normal cruising angles.

The reduction in resistance of engines is a problem usually solved by encasing them in aerodynamically efficient "nacelles." Further improvement in the form of actual forward thrust can be realized by recovering some heat energy, otherwise lost, in the cooling air and exhaust gases. Proper ducting of the heated gases accomplishes this.

Liquid-cooled engines had been practically abandoned by mid-century because of large drag losses of cooling radiators.

**Resistance of the Undercarriage.**—The undercarriage of an aeroplane has a high resistance, mainly because of the wheels. This condition was met in two ways. The wheels and landing gear may be covered with cowling in a streamline shape or the landing gear may be retractable. In the latter case the landing gear is hinged in such a manner as to permit it to fold into the wings, fuselage or engine nacelles. The retraction in usually activated by hydraulic or electric systems. Both methods of resistance reduction are in current use. The cowling (commonly called "breeches") is more common for small aeroplanes and the retractable gear for large ones.

**Resistance of the Bracing of the Wings.**—The early aeroplane was a mass of external struts and bracing with cables between wings, from wings to fuselage and engine bed, and between the various fixed and movable controls. The tendency thereafter was toward "clean" design. Modern construction methods and materials permit all bracing for monoplanes to be internal. Whereas this requires increase in weight, it is largely balanced by increase in aerodynamic efficiency. All modern high-speed transports and military aeroplanes are aerodynamically "clean" and highly streamlined. As speed requirements increase even rivet heads are made flush with the surface.

**Supercharged Engines.**—To avoid excessive power loss with increase in operating altitude, engines incorporate superchargers (centrifugal compressors) which increase the intake manifold pressure considerably over atmospheric pressure. An unsupercharged engine, if taken from sea level to 10,000 ft., suffers a loss of about 30% of its power. On the other hand, it is possible for a supercharged engine to deliver more power at altitude than it can at sea level.

### 4. ORIGIN OF AERODYNAMIC DATA OF DESIGN

The designer bases his calculations on data derived from four main sources: (1) Theoretical investigations, such as the Lanchester-Prandtl theory of the action of wings. (2) Experiments on models in wind tunnels. (3) Experiments on full-scale aero-

planes in flight. (4) Analysis of the measured performance of aeroplanes. References to the first of these divisions will be found in the article on AERODYNAMICS, where also the principles underlying experiments on models are dealt with.

**Wind Tunnel.**—The wind tunnel has played a great part in the development of aeronautics. Many manufacturing firms possess their own tunnels, used mainly for measurements of the resistance of aeroplane bodies, etc., with a view to improving performance. National wind tunnels exist in many countries, generally reserved in principle for research on problems of wide interest and application.

The main advantage of model experiments is the ease with which the experimenter can control the conditions.

**Full-Scale Experiments.**—Most of the leading aircraft-producing countries carry out full-scale experiments. In Great Britain they are made at the Royal Aircraft establishment under the control of the director of scientific research at the air ministry. In the United States they are carried out by the National Advisory Committee on Aeronautics, by the air forces and by most manufacturers.

**Analysis of Performance Tests.**—The measurements of speed and climb which are made during the acceptance tests of aeroplanes are a valuable source of information for the designer. Their analysis enables an over-all comparison between various types to be made on a rational basis, but necessarily lacks something in precision. For each type differs from the others in many features, so that, for example, an observed difference in speed cannot safely be ascribed to any one peculiarity. But with suitable precautions reliable information can be obtained in a convenient form. It is found that the factors which have the greatest influence on the speed and climb of an aeroplane are the *horsepower per unit of total weight* and the *total weight carried per unit of wing surface*. For further details of the method, and its limitations, reports of the National Advisory Committee for Aeronautics (U.S.) or of the Aeronautical Research committee (British) should be consulted.

## 5. DISTRIBUTION OF WEIGHT

Fig. 6 illustrates the relative proportions of the total weight taken up by the various sections into which it is convenient to divide the component parts. The figures apply to an average commercial aeroplane of moderate size. The distribution of weight varies from one machine to another.

**Structure.**—The "structure" includes a great deal which is not part of the essential structure of the aeroplane. A change in the specified strength affects about 60% to 70% only of the nominal structure weight.

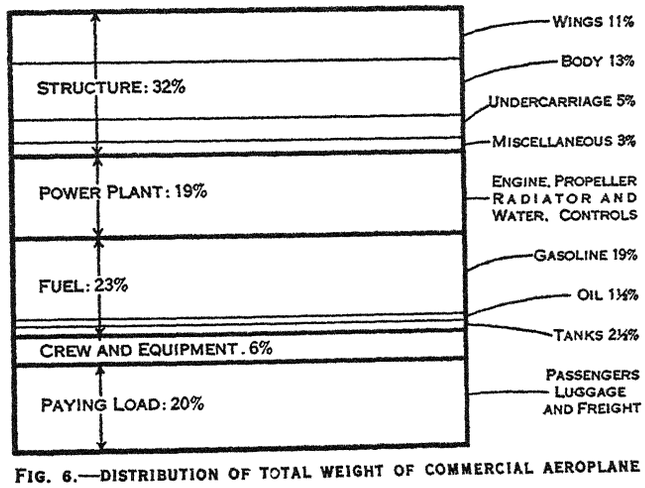

FIG. 6.—DISTRIBUTION OF TOTAL WEIGHT OF COMMERCIAL AEROPLANE

**Power Plant.**—The weight of the power plant depends mainly on the desired maximum speed of the aeroplane, and on the weight of the engine and its equipment per brake horsepower. There is generally a reduction in this item if an air-cooled engine is used instead of a water-cooled engine.

**Fuel, etc.**—The weight of fuel and tanks is dependent on the speed and duration of flight specified, and on the standard of fuel economy reached by the engine. The latter factor varies little for modern engines, both air- and water-cooled engines now giving one brake horsepower hour for about one-half pound of gasoline.

**Crew, etc.**—The crew and equipment tend naturally to absorb a progressively smaller proportion of the total weight as the size of the aeroplane increases.

**Pay Load.**—The pay load, being the balance after the above items have been accounted for, is from 13% to 20% of the gross loaded weight of the aeroplane. For slower aeroplanes it may reach a much higher percentage. Compared with other means of transport this is a high proportion. Both a passenger railway train and an ocean liner carry a much smaller percentage of pay load. That these means of transport are able to offer lower fares than aircraft is partly because of the higher running costs of an aeroplane per passenger mile, but mainly because of the fact that the volume of passenger traffic is as yet small compared to that of other common carriers.

The essential need for economy of weight in aircraft is due not only to the fact that but one-fifth of its weight is available for pay load, but to the higher cost of carrying this load by air, as compared with other ways. A saving in the weight of some part of the aeroplane of 1% of the whole allows a reduction of the cost of transport by about 5%.

## 6. EXTERNAL FORM OF AEROPLANES

**Wings.**—There is a striking variation in the appearance of wings of most modern planes as seen in plan. One thing they do have in common is large aspect ratios of about 6 or more (ratios of span to average chord). This is intended to keep *induced* drag caused by lift as low as possible. Three of the simplest plan shapes are shown in fig. 7. Variations of taper in chord (fig. 7b) and sweepback (fig. 7c) as well as actual wing tip shape distinguish planes from each other. These modifications are intended to enhance certain aerodynamic characteristics as desired by the designer such as good stall characteristics, manoeuvrability, large centre of gravity range, stability characteristics, etc. Extreme sweepback up to 45° is provided for jet-powered planes to reduce compressibility shock effects and trim changes which occur as the plane reaches the speed of sound (760 m.p.h. at sea level, standard air).

Near the tip of each wing is an *aileron* or a lateral control surface hinged about axes 1–1 (fig. 7a) and interconnected so that an upward movement of one is accompanied by a downward movement of the other. They are operated by rotation of the pilot's control wheel on the control column, and are the means for maintaining straight flight, or banking for a turn. (*See* also AILERON.)

High-lift wing flaps are also located along the trailing edge of the wing between the inboard end of the aileron and the fuselage. These are also hinged and are extended by the pilot, particularly on approach to landing, to decrease the landing speed. Partial extension is sometimes used to enhance take-off.

*Wing Incidence.*—The angular setting of the wing with respect to the longitudinal axis of the plane is called the angle of incidence in Great Britain and angle of attack in the United States; it is the angle between the airfoil chord line and the direction of the wind.

*Number of Wings.*—The appearance of aeroplanes in front and side elevation is as varied as in plan, mainly because of the use of one or more wings, engines, varied shapes of fuselage, etc.

It is of historical interest to note that biplanes, triplanes and even quadruplanes were in vogue from early years through 1922. Slowly these were displaced until even the biplane became a rarity. The trend to the monoplane was caused by the development of wing sections of great thickness, the desire to eliminate external bracing for drag reduction reasons and the development of high strength aluminum alloys permitting the use of stressed skin wings and fuselages.

In a biplane the relative position of the wings with respect to one another is defined by *gap*—the distance between the chords of the upper and lower wings—and *stagger*—the amount one wing is

set ahead of the other as measured by the horizontal distance from the leading edge of the upper wing to the corresponding point on the lower wing. These factors have considerable significance to

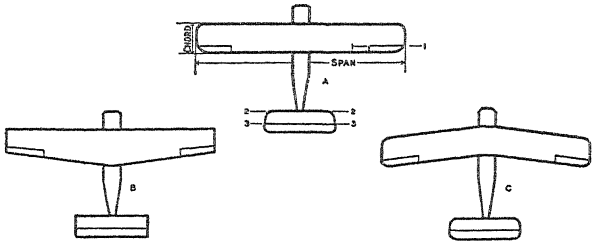

FIG. 7.—THE RELATIVE SIZES AND AREAS OF AEROPLANES, SHOWING THE SPAN OF THE MAIN WINGS IN RELATION TO THEIR CHORD, FROM WHICH THE AVERAGE RATIO OF SPAN TO CHORD MAY BE DEDUCED

the aerodynamicist who wishes to evaluate the mutual interference effects of the air flow over the respective wings by calculation.

Monoplanes vary in respect to position and shape of wings, type of fuselage and arrangement of tail areas, type of landing gear and number of power plants. Typical variations in front and side views are shown by figs. 8 and 9; in these figures, (a) shows an externally braced, high-wing, tail wheel type, light monoplane, (b) a low-wing, internally braced, tricycle gear monoplane, (c) a low-wing, twin-engine tricycle gear transport and (d) a four-engine, tricycle gear, low-wing air-line transport.

**Horizontal Tail Area.**—At a distance of approximately three chords behind the leading edge of the wings is the tail plane, in area about one ninth that of the wings. In steady flight its function is to balance or trim the aeroplane; *i.e.*, to ensure that the resultant of all the air forces on the aeroplane passes through the centre of gravity. (*See* AERODYNAMICS.) It is generally in two parts. The front part, about 60% of the whole, is normally fixed, though means may be provided by which the pilot can alter its angle of incidence by rotating it about an axis such as 2–2 (fig. 7a), thus enabling the aeroplane to be trimmed for flying at various speeds This operation is analogous to trimming the sails of a ship so that it carries no weather or lee helm.

In a modern aeroplane a movable tail plane is generally considered indispensable, unless trimming planes such as trim tabs (described later) are used, in which case the stabilizer need not be adjustable.

The rear part of the tail, or *elevator,* is hinged on an axis such as 3–3 (fig. 7a), and connected to the control column in such a way that a forward movement of the pilot's hand depresses the trailing edge of the elevator and causes the machine to dive, and vice versa. The elevator is the primary control organ of an aeroplane, since by it the pilot alters the angle of attack of the wings and hence in conjunction with the engine power controls the rate of climb or descent and the speed.

**Vertical Tail.**—The vertical stabilizing and controlling surfaces, a fixed fin and a movable rudder connected to foot pedals on which the pilot's feet rest, are generally situated at the aft end of the fuselage above the horizontal surfaces. They perform the same function as the rudder in a boat. The fixed fin provides directional stability; *i.e.*, it tends to keep the plane on a straight course. The hinged rear part of the vertical tail, or rudder, serves two functions; it provides a means to allow the pilot to "yaw" the aeroplane and change direction of flight, and it is used to trim the plane for straight flight, particularly when one wing engine of a multiengined aeroplane may not be operating. This latter function is quite important since the remaining engines have a tendency to lift the wing on one side more than the other and pull the plane into a power spin.

Rudder control forces for a large multiengined plane can be quite high and require considerable exertion on the part of the pilot. Accordingly, *trim tabs* are provided on the rudder to assist the pilot. These are small hinged surfaces attached to the trailing edge of the rudder, which, when moved (for example, to the right), force the rudder to the left because of its aerodynamic forces, and effectively simulate application of "left" rudder pedal by the pilot. When adjusted properly the tab holds just enough rudder to maintain straight flying despite adverse yawing forces of an inoperative engine.

Variations of the trim tab principle, known as balancing tabs, servo-tabs or flying tabs, etc., are also employed, particularly on very large planes, to allow the pilot to manoeuvre without excessive rudder pedal pressures. These devices automatically assist the pilot to move the rudder in the desired direction as he presses the rudder pedal.

For small single-engine planes it is sometimes possible to dispense with a rudder entirely; thus we have the "two-control" plane (aileron and elevator control only). In such planes it is also necessary to limit the upward travel of the elevator to preclude development of wing stalling with subsequent entry into a spin; without a rudder recovery from a spin might become difficult if not impossible.

**Location of Power Plant.**—Engines, propellers, oil tank, accessories and controls are enclosed in body forms called *nacelles.* With few exceptions, "tractor" positions of propellers are used, although "pusher" arangements are seen now and then When two or more power plants are used it is customary to distribute them along the wings; each engine nacelle is in itself an integral unit able to function independently of others. Two and four engines are common, although trimotors are seen where the one engine is located in the nose of the fuselage. The vertical location of the "thrust axis" with respect to the plane's centre of gravity is important since care must be taken to avoid giving rise to large couples which would otherwise tend to rotate the aeroplane in a vertical plane as throttles are altered. Care must also be taken to locate tail surfaces above the propeller slip stream to avoid troublesome vibrations.

**Fuselage and Landing Gear.**—The fuselage serves as a connecting member of wings, power plants, tail surfaces and landing

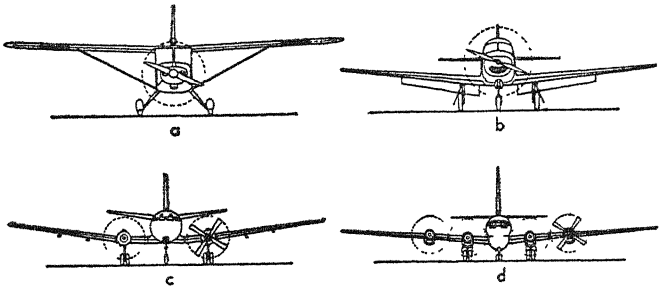

FIG. 8.—FRONT VIEW OF TYPICAL MONOPLANE ARRANGEMENTS: (A) THE PIPER STINSON VOYAGER; (B) THE RYAN NAVION; (C) THE MARTIN 2-0-2 AIRLINER; (D) THE BOEING STRATOCRUISER

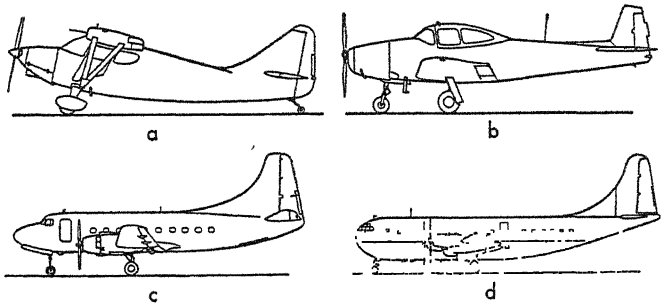

FIG. 9.—SIDE VIEW OF MONOPLANES SHOWING NOSE-WHEEL AND TAIL-WHEEL TYPE LANDING GEARS: (A) THE PIPER STINSON VOYAGER; (B) THE RYAN NAVION; (C) THE MARTIN 2-0-2 AIRLINER; (D) THE BOEING STRATOCRUISER

gear. It also contains accommodations for operating crew, passengers and cargo. Sometimes fuel tanks are included but mostly these are placed within the wing structure for safety and to conserve space. Open cockpit fuselages, where occupants are exposed to the air, were displaced by closed cabins, with opening doors on

the side or sliding canopies in the top to permit entry. On large transports, emergency exit openings are provided to permit rapid egress in the event of accident. The fuselage is designed as a boat hull, in flying boats, to permit operation from the water surface.

Landing gears are usually seen in tail-wheel or nose-wheel (tricycle) configurations. (*See* fig. 9.) For large transports, dual wheels are sometimes used on each landing gear strut to reduce wheel loads.

Retracting mechanisms are employed to rotate the gear upward into recesses in the wing and fuselage structure.

### 7. STABILITY AND CONTROL

The general principles of stability and control are dealt with in the article AERODYNAMICS, and the stabilizing and controlling surfaces have been referred to above. The necessary disposition and dimensions of these surfaces are decided in practice chiefly by direct comparison with previous designs. Since, however, aeroplanes are not merely scale copies of one type, some rational means of using the accumulated experience of previous work is essential, and it is this that research into the fundamentals of stability and control is able to supply. Needless to say, even these methods break down when the aeroplane in question is not broadly similar to those from which the data are derived, and then nothing short of a thorough investigation, assisted by model experiments, will suffice. Very often, even with the best that can be done in this way, uncertainties remain, and the designer is forced, as in other branches of engineering design, to rely upon his ability to draw conclusions from insufficient premises.

**Stability.**—Stability, the property of returning to a steady state of motion when deliberately or accidentally disturbed, implies as a necessary preliminary the existence of equilibrium, or "trim," in that state. An aeroplane is trimmed for a steady condition of flight by an adjustment of its tail plane, or adjustment of the trim tab controls, the elevator being left free. The degree of stability generally considered desirable for a commercial aeroplane can be attained by arranging the size of tail plane and the fore and aft position of the centre of gravity within certain limits. The further back the centre of gravity, the larger is the necessary tail area. The fore and aft position of the centre of gravity in relation to the wing is defined by its distance from a plane passing through the leading edge of the wing perpendicular to the chord, for a monoplane; for a biplane an equivalent monoplane wing is substituted. In normal aeroplanes this distance is usually about one-third the chord, though it has varied between one-quarter and one-half. The height of the centre of gravity of an aeroplane in relation to the wings has a secondary effect on its stability. In particular, a low centre of gravity is not necessary for stability.

Adequate stability is usually present when the horizontal tail area is approximately 12%–15% of the wing area and when a tail length ratio of from 2.5 to 3.0 is provided, the latter ratio being the distance from the tail plane to the centre of gravity divided by the wing chord.

Elevator areas of about 40% of the horizontal tail surface area usually provide sufficient controllability for the range of position of centre of gravity normally employed.

Lateral and directional stability depends mainly on the provision of adequate fin and dihedral angle. Good stability in these directions is of importance to comfort and instrument flight.

**Aileron Control.**—Ailerons of an area between one-twelfth and one-eighth of that of the wings are usually provided, and give adequate control at all normal flying speeds. At low speeds, however (more accurately, at angles of attack of the wings in the neighbourhood of stalling), not only are normal ailerons ineffective, but they may actually become a source of danger, their use aggravating an inherent tendency of the stalled wings to force the aeroplane into a spiral dive or spin. (*See* AILERON.)

**Rudder Control.**—An effective rudder is as essential for safety at low speeds as effective ailerons. The efficiency of any given rudder depends on its being arranged so that the body does not shield it, but it is found that when the product of the ratios

$$\frac{\text{area of rudder and fin}}{\text{area of wings}}$$

and

$$\frac{\text{distance of rudder from centre of gravity}}{\text{semispan of wings}}$$

is above one-twentieth, a satisfactory control is obtained. The latter ratio is usually about one, so that the former should not be less than one-twentieth. The area of the rudder is generally about two-thirds that of the rudder and fin combined.

**Automatic Pilot.**—All modern transport aeroplanes are equipped with an automatic gyroscopic pilot. The device is designed to pilot the plane on a given heading. It can be adjusted for climb, descent or for turns It is so arranged that the pilot can over control by the normal use of control column and rudder.

The automatic pilot has many advantages. It produces more steady flight than is otherwise possible and permits the pilot to attend his radio and navigational duties with greater freedom. Although it is not a normal practice, it may be set for take-off or landing.

### 8. SAFETY OF AIR TRAVEL

Air travel would have been much more quickly adopted except for a general public apprehension of the risks involved. These risks are associated with the following causes: (1) physical failure or error of the pilot, (2) fire when in flight, (3) collision when in flight, (4) breakage of the structure and (5) forced landing. Dangers of the first four types are not peculiar to aircraft and the precautions they involve are common to transport by road, rail and sea. The measures adopted in air transport largely eliminated them. It is mainly the dangers which may arise when an aeroplane is forced to land that loom large in the minds of those who might otherwise travel by air. While it cannot be said that these fears are entirely unwarranted, yet in so far as the design of aircraft is involved the position rapidly improved.

**Forced Landings.**—Forced landings may be necessitated by engine trouble, structural failure, fuel shortage, weather, ice forming on the aeroplane or loss of knowledge by the pilot of location. A well-qualified pilot with a properly equipped aeroplane should not experience forced landings caused by loss of bearings, and should never experience fuel shortage. Forced landings caused by weather, while annoying, are not dangerous in a country well-equipped with emergency landing fields. Structural failures are extremely rare in normal flight. Ice forming on the wings and propellers, however, was formerly a serious problem. The danger of ice is twofold. It adds considerable weight to the structure and at the same time decreases the normal efficiency thereof by spoiling the lifting qualities of the wings and the traction qualities of the propellers. Some trouble has also been experienced by ice forming in carburettors and reducing engine power output. However, invention as well as the development of efficient meteorological services and weather broadcasting systems largely if not completely met the situation. It would be a rare phenomenon if ice-forming conditions existed throughout the altitude range of the aeroplane. Altitudes for flight should be sought which do not favour icing. To arrive at such altitudes, however, it may be necessary to pass through icing layers. Since clear ice, under severe conditions, can form at the rate of three inches per minute, it is an important problem which gave much cause for thought and experimentation. Its importance was more keenly felt after the development of instrument flying. Formerly little cloud flying was attempted but with modern methods cloud flying is nearer the rule than the exception.

To prevent ice from forming in carburettors, heaters are installed to warm the incoming air. Propeller deicing is accomplished in one of two ways, either by use of a liquid solution using alcohol as a base or by electrical heating. The liquid solution is applied by centrifugal force through a rotating slinger ring onto the surface of the blade at the blade hub. Electrical heating is accomplished by specially developed coatings on the blade surface which become

heated as an electrical current is passed through it.

Two systems of preventing ice from forming on wings are used. One involves the use of pneumatic driven, pulsating, rubber pads on the leading edge; the pulsations crack the ice to be carried off by the air. Thermal heating of wing leading edges is another means; the waste exhaust heat from the engines is usually ducted along the leading edge for this purpose.

From the height of about 3,000 ft., for a single-engine plane, approximately four minutes are available in which the pilot may choose a landing place. If the failure occurs before the aeroplane has reached its cruising altitude, the time and the corresponding area of ground in which this landing place is to be found are reduced in proportion. These considerations unfortunately may result in the pilot's having to execute somewhat sharp turns in order to place the aeroplane correctly, and it is during these that the controllability of the machine is most severely tested. The ultimate danger lies in the fact that the speed of horizontal travel at the moment of landing cannot possibly be less than the stalling speed. In practice with a typical small plane in level flight it will be between 55 m.p.h. and 70 m.p.h. In a banked turn it can be from 15 m.p.h. to 25 m p.h. higher because of the higher lifts required under the acceleration forces of the turn. The inexperienced pilot, in an endeavour to make the most of what space is available, frequenty turns too tightly, stalls at a speed higher than he normally would expect and, before recovery can be completed, loses excessive altitude or spins and crashes.

### 9. STRUCTURAL DESIGN

**The General Problem.**—The discussion so far has concerned aerodynamic and performance aspects of the aeroplane. Of equal importance to the success of the plane is the internal design or structure which, while being extremely light, must still have the strength needed to cope with all possible loads it can experience in service. It must also be reliable in service and incorporate all known safeguards for safety. The modern plane structure (or air frame) is an intricately complicated unit requiring great ingenuity on the part of designers and necessitating many compromises before reaching its final form. A plane which is properly designed and meets all government regulations for strength and reliability is termed structurally airworthy. The art of designing for all safety requirements and proving that an airplane meets these requirements is denoted by the general term "airworthiness."

The structural airworthiness of the plane involves not only the use of ordinary principles applicable to conventional engineering structures but many specially developed theories applicable to thin shell structures which "fail" by elastic buckling. Great care must be taken to select proper materials and use these materials most efficiently by proper shaping, forming and joining. To proportion structural elements suitably a knowledge is required of the external, or applied, loads to calculate the stresses in each element. The margin between the stresses, so calculated, and the minimum safe or allowable stress for the element is the safety margin. As a minimum requirement this margin, on most commercial planes, must equal 50% of the applied load (*i.e.*, a factor of safety of 1.5 above the applied load must be attained before ultimate failure load is reached).

Assurance of reliability of structural parts is also essential to airworthiness. This simply means that they must be rigid enough to withstand abuse in service, must not be subject to disastrous fatigue failures caused by repeated loadings or vibrations, and must have ability to withstand wear or deterioration in adverse atmospheric conditions. An unreliable bolt in the control system could result in an accident as serious as one caused by structural failure of a wing spar. However, it cannot be claimed that parts can be designed for infinite life; hence, a reasonable program of inspection, maintenance and replacement of parts in service is a necessary consideration.

Finally, airworthiness is dependent on the success of the designer in incorporating special safety features. For example, control systems are duplicated, or otherwise devised, in such a way that should failure occur to any one part a separate means will be available to permit accomplishing a safe landing. Control surfaces have extra hinges. Passenger seats are designed for crash load conditions and are provided with special safety belts (aft-facing seats have been proposed to enhance safety in the event of minor accidents). Fuel tanks are designed to withstand minor crashes without rupture. Windshields are specially designed to resist the impact of collision with birds in flight. Fuselages are specially designed to withstand loads caused by "ditching" the plane in a forced landing on water or land.

**Load Factors.**—The one most important criterion of strength of an aeroplane structure is its "applied load factor." Various other terms are used but by definition the load factor ($n$) is the amount by which, because of accelerations imposed in manoeuvres or turbulent air, the normal loads are increased in the ratio $L/W$, $L$ being the total wing lift and $W$ being the weight of the aeroplane. This ratio is one for level flight where $L=W$, and can be positive or negative in other conditions. By reference to basic aerodynamic equations for lift it can be seen that $L$ is directly proportional to angle of attack and the square of the speed ($V^2$). Thus, if the angle of attack is unchanged but the speed doubled, $n$ would be 4. Assuming the lift coefficient can also be doubled simultaneously by increasing the angle of attack, a further increase of load factor to a total value of 8 would be experienced.

It is theoretically impossible to provide enough strength to prevent failure of the structure. Fortunately, however, reasonable maximum values of $n$ can be specified for design purposes so that the likelihood of structural failure is remote during the life of the plane. The appropriate value can vary with the type of plane and its contemplated use; otherwise transport planes would be excessively heavy and uneconomical. For military fighters, $n$ may be as high as 10; for private planes, 4.0, and for commercial transports, 2.5 to 3.0 can be safely used. Fig. 10 shows in briefest possible detail the general relationship of load factor and speed for a typical plane

**Manoeuvring Loads.**—The loads induced by the pilot in manoeuvring the plane during turns, banks, stalls, pull-ups, rolls, etc., can be measured by means of an accelerometer. This instrument measures the load factor in terms of the normal acceleration caused by gravity, $g$. A $3g$ load factor is recorded when $\frac{L}{W}=3$ (neglecting secondary factors such as the lift on the tail surface, etc.). The outside outline "envelope" of fig. 10 is the safe structural limit manoeuvring strength of the plane. The pilot is required to so operate his plane as to stay inside this envelope at all times. For the example shown, he must not exceed a positive $3g$ or a negative $1g$ load factor up to the "never exceed" limit speed ($V_D$). For his part, the designer must make sure the wing, fuselage, tail surfaces and control systems are strong enough to withstand any combination of speed and "$n$" within the envelope.

Given the necessary control power and indifference to his own safety the pilot can, as before illustrated, impose quite high load factors in the plane structure. Most pilots "blank out" or temporarily lose control of certain senses, including sight, at less than $8g$. This consideration in itself provides a safety factor limiting practical application of extreme stresses, particularly for military fighter aircraft.

**Rough Air or Gust Loads.**—The sharp impact of rough or turbulent air on the plane produces "gust loads" which in principle are simply the aerodynamic effect of a rapid change of wing lift caused by change in the angle of attack. Vertical currents of air are responsible for this; the higher the vertical velocity of gust the higher the gust load factor produced. The designer can account for the effect of gusts in the manner shown by the 30 ft./sec. and 15 ft./sec. gust velocity broken lines of fig. 10. In these instances it will be noted that for a given gust velocity the higher the speed the greater the "bump" experienced. Planes are designed so that they can be safely flown at their cruising speed, $V_c$, in moderately rough air, which is usually associated with effective gust velocities of about 30 ft./sec. For very rough air it behooves the pilot to slow down even to a lower speed where much lower gust load factors will be the result.

**Ground Loads.**—In addition to being capable of taking stresses imposed under all flight conditions the structure must be designed

to withstand those developed in landings. Here again recourse is made to load factors; only in this instance the acceleration forces are applied to the landing wheels rather than the wings. Landing gears usually incorporate shock struts, which absorb the energy of impact associated with the landing by developing a resisting force which acts continuously during the compressing of the strut. A well-designed landing gear is one which will limit the applied forces to less than about 4*g* for commercial aircraft. Normal

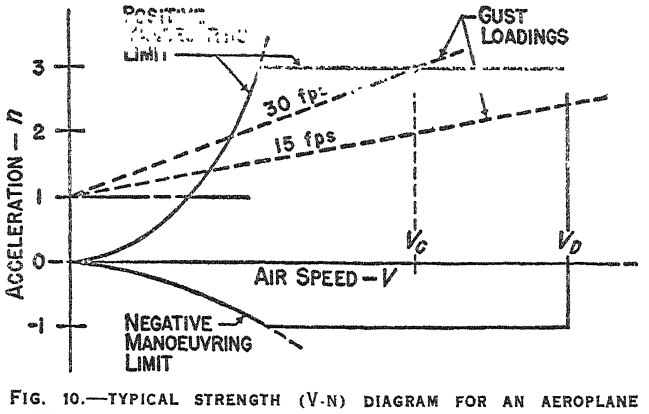

FIG. 10.—TYPICAL STRENGTH (V-N) DIAGRAM FOR AN AEROPLANE SHOWING MANOEUVRING AND GUST LOAD FACTOR CONDITIONS

landings are accomplished with much lower accelerations than this, but to take care of the worst cases of misjudgment and ground gust effects higher valves are used.

**Proof of Strength.**—Knowing the external loads on the plane structure, calculations are made of the stresses imposed on each part, bolt and rivet. Most structures are highly redundant and calculations can only be made with difficulty. Where doubt may exist as to the actual value of stresses or the path taken by loads, recourse is made to structural testing. Elaborate jigs are required to hold the structure and allow proper loading and observation of results. A major portion of the time and expense of development of a modern plane is spent in the structural testing program. As a result, any commercial plane which conforms to the official criterion of strength and has been certificated by the airworthiness authorities of the government can, if operated sensibly, carry passengers with complete safety.

## 10. MATERIALS USED IN CONSTRUCTION

**Early Composite Structures.**—The materials most commonly used for the main structural members of early aeroplanes were wood and steel, with a fabric covering for the wings. The wood used was chiefly spruce of the highest grade, and in many aeroplanes the whole of the main structure, with the exception of ties and joints, was of this material. Ties and the joints or fittings by which they were attached to the other members were generally of steel. Steel tubes were used in some parts, either, as in the undercarriage, because of their robustness, or, as in the control mechanism, because of their efficiency in transmitting torsion.

The cross section of the wing spars has the I section used in general structural engineering, though the thickness of the web and flanges is much larger in proportion to the over-all dimensions of the section than is usual in steel I girders.

Wood as a structural material suffers from the following disadvantages: (1) Suitable grades cannot be freely obtained. (2) When exposed to the atmosphere, particularly to large changes in temperature and humidity, wood deteriorates more rapidly than steel or other metals. (3) The external appearance of wood is often misleading as an indication of its internal condition. (4) Glue and wood screws cannot be entirely avoided, and both are sources of weakness and uncertainty. (5) When a wooden structure is involved in an accident, many of its members break completely and splinter, and the structure disintegrates, whereas metal members often merely bend, and an all-metal structure generally reserves much of its original shape. (6) Wood has no inherent resistance to fire. These disadvantages formed the chief incentive to the development of all-metal construction for planes.

**All-Metal Structures.**—The development of all-metal structures was originally mainly confined to replacing each of the wooden members of the composite structure described above by a metal member, using either steel or duralumin. In such a structure the load to be borne by each member was of a fairly simple character and could be estimated fairly closely. Hence, a comparison of the merits of a composite and an all-metal structure on these lines can be reduced to a comparison of typical members.

In small private aeroplanes welded steel tubular construction was still used quite extensively at mid-20th century. Wing spars might still be of wood, but more commonly they were of extruded aluminum alloy shapes. The exterior surfaces of wings, fuselage and tail surfaces might be either fabric or metal. When fabric was used it was usually a high-grade cotton fabric material laced onto the structure and finished with aircraft dope to give it tautness and air tightness. Metal coverings were made using a thin sheet aluminum alloy riveted construction. Streamlined steel or aluminum alloy tubing was used to form external bracing or struts for monoplane wings and landing gears.

For most planes the trend has been toward *monocoque* or semi-*monocoque* construction with the entire outer surface of the aeroplane of the metal stressed skin construction. Developments in the production of large, thin, uniform sheets of aluminum alloys, and in the art of welding and riveting, made desirable the *monocoque* type of construction in which the covering of the fuselage furnishes the strength. In the semi-*monocoque* type part of the stress is borne by the stressed skin and part by reinforcement.

Very high-speed aircraft require stiff structures for strength, rigidity and preservation of external contour. For such aircraft thick plate construction and large extruded and milled internal structural members are employed.

**Materials Used.**—The form and arrangement of internal structural members are dictated by the choice of materials, properties thereof and available methods for forming, fabricating and joining such materials. Aircraft materials fall into three principal classes: wood, steel and nonferrous metals. The accompanying table contains a brief listing of the most important of these, with appropriate weight and strength data for purposes of comparison. For many technical reasons a comparison of strength properties alone cannot be relied upon to indicate relative superiority; the particular application involved and other essential properties such as workability, fire resistance quality, heat insulating ability, surface hardness, relative rigidity, susceptibility to corrosion and availability of standard shapes enter into the choice.

Plastics had not yet reached the perfection needed for universal structural application at mid-century. Many nonprimary structural applications, however, are found for these materials in

*Typical Properties of Aircraft Materials*

| Material | Specific weight lb./cu in | Tension yield lb /sq in. | Tension ultimate lb /sq in. | Modulus of elasticity *E* |
|---|---|---|---|---|
| Wood | | | | |
| Spruce | 0 015 | — | 9,400 | 1 3x10⁶ |
| Mahogany plywood | 0 021 | — | 5,770 | 0 75x10⁶ |

| Mh | 0 0635 | 22,000 | 32,000 | 6 5x10⁶ |
| FS-1h | 0 0645 | 29,000 | 39,000 | 6 5x10⁶ |

flooring, partitions, radomes, ducts and transparent enclosures.

Castings and forgings of both steel and aluminum alloys are used extensively for fittings, hinge brackets and parts carrying relatively large concentrated loads.

Resistance to corrosion is of importance in aircraft structures. Dissimilar metals, where joined together, must be suitably insulated from one another by tape or zinc chromate primer to prevent

galvanic corrosion. Alclad possesses excellent natural resistance to weathering. Steel parts plated with zinc or cadmium or painted with zinc chromate primers also have good corrosion resistance.

The high strength of aircraft metals, despite light weight, is obtained through alloying certain constituents such as carbon, chromium, nickel, copper and zinc with steel, aluminum or magnesium. Proper treatment of these alloys is required, such as heat treatment, aging and cold-working (rolling), to develop the best properties New alloys were constantly developed to obtain improved strength properties both at low and high temperatures; examples of these included zirconium, cerium, titanium, etc.

**Allowable Stresses.**—What maximum stress will a particular strut, tubing, beam or bolt take before it will fail? How are such stresses determined? These questions require an answer before the stress analyst can be sure that the structural parts are safe. Aeroplane parts fail mostly under tension or compression loads. In the first case the matter is relatively simple since the important strength properties involved are the yield tensile strength and the ultimate tensile strength, the former being the stress at which plastic strain begins and the latter the stress at which rupture occurs. For all materials these values can be measured, using standard test specimens, in a tensile testing machine The accompanying table shows such typical values Knowing the allowable ultimate tensile stress of the material of the strut, tube or beam, the analyst can easily calculate the load which it can support in pounds by multiplying this stress by the appropriate cross-section area.

For compression allowable stress values the problem is much more complicated. Here failure may occur in a variety of ways; for example, by column buckling, by twisting or general instability and by local buckling or crushing. A long steel tube can fail under a very low end load by suddenly buckling laterally. If the load is relieved the tube will return to its original position unharmed. This is called column (or elastic) buckling. As the tube is shortened in length the allowable end load can be increased correspondingly; in practice, however, it will never reach in magnitude the load it can take in tension.

Thin sheets exhibit a similar characteristic by buckling readily under compressive loads. If the sheet is reinforced by attaching stringers lengthwise of the sheet, or by corrugating it, higher compressive loads can be carried before it will buckle. This is the principle of stiffened skin construction used in aircraft fabrication, making it possible to use lightweight thin metal materials. A great variety of types and shapes of stiffened structural elements are used by manufacturers. The allowable stresses for such elements are largely determined from a number of sheet stringer combination panel tests. Results of the tests, supplemented by theoretical methods, are then used to establish criteria which accurately predict failing loads for comparable elements of the aircraft structure.

There are many other stresses which are of importance to designers, among them allowable shear and bearing stresses of materials for use in determining the strength of rivet and bolt connections. Fatigue stresses, or the ability of a material to withstand cyclical repetition of load, are also important for determination of the useful life of a part in service.

**Joining of Materials.**—The aeroplane designer is faced with the problem of transforming materials which he procures in the form of flat sheet, bars, round tubing or extruded shapes such as angles, channels, zees, etc., into parts of a plane. This requires forming of pieces, fitting to assembly jigs and joining the parts together. The three most common aircraft processes of joining parts are welding, riveting and bonding.

Welded construction is employed extensively for the joining of steel parts. The most common type is oxyacetylene torch welding, although electric resistance and arc welding are also used. Parts which require heat treatment for increased strength must be furnace-heated subsequent to welding and quenched under correct temperature conditions Since heat destroys the strength properties of aluminum alloys, only certain such materials can be satisfactorily torch-welded, and this by skilled operators under controlled conditions. Spot welding of alclad aluminum alloys has, however, been successfully employed. Spot welding, using automatic machines, is used also for fabricating parts made of stainless steel materials.

The most common method of joining high-strength aluminum alloy parts is by riveting This requires the careful fitting of parts, drilling of rivet holes and, usually, manual driving of rivets with air guns. On exterior surfaces where a smooth surface is necessary, flush riveting is employed; *i.e*, the outside head of the rivet fits into a countersunk hole in the sheet. Rivet materials must be soft enough to drive without cracking and yet, because of the hardening effect of the working received in driving, it must develop the required strength to carry the required loads through the joint.

Bonding involves joining parts (exclusive of heat bonding by brazing) by using a plastic adhesive between surfaces. By this means it is possible to join not only like materials but materials such as aluminum alloy sheet to wood, rubber or plastic materials.

**AEROTHERAPEUTICS.** In addition to the general use of open air and sunshine, there are several particular ways of using air for therapeutic purposes. Thus, oxygen-enriched air is used for those made ill through breathing irritant gases such as were used in warfare.

These gases evoke oedema of the lungs and danger of suffocation through want of oxygen. So, too, in cases of pneumonia, shock and failing circulation, oxygen inhalation is useful. It is administered either by a mask or in a special chamber in which the patient is put. In the latter case great precaution must be taken against the danger of fire.

Oxygen containing 5% of carbon dioxide provokes deep breathing, and is useful in cases when the lungs require expanding, as after operations for empyema, when hypostatic congestion of the lungs threatens, and in cases of poisoning by carbon monoxide, as in ordinary coal gas poisoning, etc. This mixture is particularly useful for breathing during induction of and after anaesthesia with ether, since the deep respiration induces anaesthesia quickly, and washes the ether out of the body at the end of the anaesthetic period. The breathing of nitrous oxide and oxygen in a compressed air chamber at half an atmosphere extra pressure gives deep and safe anaesthesia.

Certain dusts in the air act as irritants to those affected with hay fever and asthma; *e.g.*, the pollen of plants, spores of aspergillus mould. It has been found possible to relieve such patients by sending them to high mountains.

In a mercurial or sulphur bath, the patient, enveloped in a sheet, sits on a chair beneath which a lamp is placed both to volatilize the drug and produce a steamy atmosphere. The vapour is absorbed by the skin. This treatment is used for syphilis and also for scabies and other affections of the skin. (*See* THERAPEUTICS.)

Air at a low pressure is used locally for cupping and thus producing local congestion, the blood being drawn into the part to which the cupping apparatus is applied at the expense of other organs. A similar result is got by local application of heat, poultices, etc. In operations where the chest cavity is opened air is blown into the lungs through a tube introduced through the larynx in order to keep the lungs distended.

**Ozonized Air.**—Ozonized air has been used in treatment of tuberculosis and wounds. Ozone is an irritant to the lungs and can be used safely only in very weak concentrations; *e.g.*, in a concentration just perceptible to the smell. It takes away the power to smell bad odours, but otherwise has no valuable properties which have been proved. Its chief use, therefore, is for deodorizing offensive smells. (L. E. H.)

**AERSCHOT, PHILIPPE DE CROY,** DUKE OF (1526–1595), prince of Chimay, governor general of Flanders, was born

at Valenciennes, and inherited the estates of the ancient and wealthy family of Croy. He was appointed governor of the citadel of Antwerp when the Spanish troops withdrew in 1577. After a period of vacillation he deserted Don John toward the end of that year.

Jealous of the prince of Orange, he was then the head of the party which induced the archduke Matthias (afterward emperor) to undertake the sovereignty of the Netherlands, and soon afterward was appointed governor of Flanders by the state council.

A strong party, including the burghers of Ghent, distrusted the new governor, and Aerschot, who was taken prisoner during a riot at Ghent, was only released on promising to resign his office.

He then sought to regain the favour of Philip of Spain, and having been pardoned by the king in 1580 shared in the government of the Netherlands; but he refused to serve under the count of Fuentes when he became governor general in 1594, and retired to Venice. He died on Dec. 11, 1595.

**AERTSZEN** (or AARTSEN), **PIETER** (1507–1573), called "long Peter" on account of his height, Dutch historical painter, was born and died at Amsterdam. When a youth he distinguished himself by painting homely scenes, in which he reproduced articles of furniture, cooking utensils, etc., with marvellous fidelity. An excellent specimen of his style on a small scale, a picture of the Crucifixion, may be seen in the Antwerp museum. Aertszen was a member of the Academy of St. Luke, in the books of which he is entered as *Langhe Peter, schilder.* Three of his sons attained to some note as painters.

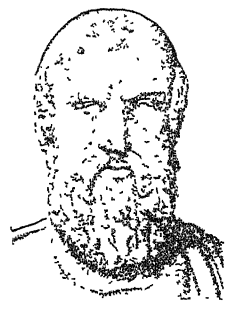
**AESCHINES** (5th century B.C.), an Athenian philosopher and orator and a friend of Socrates. Diogenes Laertius preserves a tradition that it was he, not Crito, who offered to help Socrates to escape from prison. He was always a poor man He started a perfumery shop in Athens on borrowed capital, became bankrupt and retired to the Syracusan court. According to Diogenes Laertius (ii, 61), Plato, then at Syracuse, pointedly ignored Aeschines, but this does not agree with Plutarch *De adulatore et amico* (c. 26). On the expulsion of the younger Dionysius, Aeschines returned to Athens, and, finding it impossible to profess philosophy publicly owing to the contempt of Plato and Aristotle, was compelled to teach privately. Besides forensic speeches, noted for their purity of style, he wrote several philosophical dialogues: (1) *Concerning virtue, whether it can be taught;* (2) *Eryxias, or Erasistratus: concerning riches, whether they are good;* (3) *Axiochus: concerning death, whether it is to be feared,* but those extant are not genuine remains.

J. le Clerc made a Latin translation of them, with notes and several dissertations, entitled *Silvae Philologicae,* and they were edited by S. N. Fischer (Leipzig, 1786) and K. F. Hermann, *De Aeschin. Socrat. relig.* (Göttingen, 1850). The genuine dialogues appear to have been marked by the Socratic irony; an amusing passage is quoted by Cicero in the *De inventione* (i, 31). *See* also R. Hirzel, *Der Dialog,* i, 129–140 (1895); T. Gomperz, *Greek Thinkers,* vol. iii, p. 342, English trans. by G. G. Berry (London, 1905).

**AESCHINES** (389–314 B.C.), Athenian orator, the political opponent of Demosthenes. Aeschines and Demosthenes were both members of the first embassy to Philip (February–March 346 B.C.).

Philip's envoys appeared in the assembly on April 15 and 16, and between these two meetings Aeschines appears to have been won over to Philip's interest; on April 15 he refused, with Demosthenes, to accept a clause excluding Phocis; on April 16 he supported a peace in which the question was left vague. The same ambassadors went to administer the oaths to Philip, but, after so delaying on their journey that Philip had time to make conquests in Thrace, Philocrates and Aeschines (outvoting Demosthenes), allowed him to exclude the Phocians. But on his return Aeschines falsely assured the assembly that he had private information that Philip meant to support Phocis. The Athenians believed him and Phocis, left without support, surrendered.

In 345 Demosthenes accused Aeschines of misconduct, but Aeschines saved himself by an attack on Demosthenes' supporter (in *Timarchum*).



In 343 Demosthenes renewed the attack, and Aeschines secured a bare acquittal (*De Falsa Legatione*).

In 340 war broke out again with Philip, and thanks to Aeschines, who stirred up a sacred war in 339, he managed to enter Greece unopposed, as general of the Amphictyonic forces. Athens and Thebes, united by Demosthenes, resisted desperately, but were decisively defeated at Chaeroneia (338).

Aeschines' party secured favourable terms from Philip, and prosecuted Demosthenes on various charges, but the Athenians loyally supported him, and in 336 it was proposed to crown him for public services. Aeschines brought a *graphē paranomōn* against the proposer (in *Ctesiphontem*), but the case was not tried till 330. Demosthenes' speech, "On the Crown" (a vindication of his whole policy), secured the condemnation of Aeschines, who withdrew to Rhodes.

**AESCHYLUS** (525–456 B.C.), Greek poet, the first of the only three Attic tragedians of whose work entire plays survive, and in a very real sense the founder of the Greek drama, was born at Eleusis in 525 B.C. His father, Euphorion, belonged to the "Eupatridae" or old nobility of Athens, as we know on the authority of the short *Life* of the poet given in the Medicean manuscript (*see* note on "authorities" in the *Bibliography*). According to the same tradition he took part as a soldier in the great struggle of Greece against Persia; and was present at the battles of Marathon, Artemisium, Salamis and Plataea, in the years 490–479.

AESCHYLUS, FATHER OF THE GREEK DRAMA
Head now in the Capitoline Museum, Rome, believed to be that of Aeschylus, probably of about the 5th century B.C.

At least one of his brothers, Cynaegirus, fought with him at Marathon, and was killed in attempting a conspicuous act of bravery, and the brothers' portraits found a place in the national picture of the battle which the Athenians set up as a memorial in the Stoa Poecile (or "pictured porch") at Athens.

The vigour and loftiness of tone which mark Aeschylus' poetic work were results not only of his native genius and gifts, powerful as they were, but also of the personal share he took in the great actions of a heroic national uprising.

In the same way, the poet's brooding thoughtfulness on deep questions—the power of the gods, their dealings with man, the dark mysteries of fate, the future life in Hades—though largely a result of his turn of mind and temperament, was doubtless connected with the place where his childhood was passed. Eleusis was the centre of the most famous worship of Demeter, with its processions, ceremonies, mysteries, impressive spectacles and nocturnal rites; and these were intimately connected with the Greek beliefs about the human soul and the underworld.

His dramatic career began early and continued for more than 40 years.

In 499, his 26th year, he first exhibited at Athens; and his last work, acted during his lifetime at Athens, was the trilogy of the *Oresteia,* exhibited in 458. The total number of his plays is stated by Suidas to have been 90, and the 7 extant plays, with the dramas named or nameable which survive only in fragments, amount to more than 70, so that Suidas' figure is probably based on reliable tradition. It is well known that in the 5th century B.C. each exhibitor at the tragic contests produced four plays, and Aes-

chylus must therefore have competed (between 499 and 458) more than 20 times, or once in two years. His first victory is recorded in 484, 15 years after his earliest appearance on the stage; but in the remaining 26 years of his dramatic activity at Athens he was successful at least 12 times. This clearly shows that he was the most commanding figure among the tragedians of 500–458, and for more than half that time was usually the victor in the contests. Perhaps the most striking evidence of his exceptional position among his contemporaries is the well-known decree passed shortly after his death that whosoever desired to exhibit a play of Aeschylus should "receive a chorus"; *i.e.*, be officially allowed to produce the drama at the Dionysia.

The existence of this decree, mentioned in the *Life*, is strongly confirmed by two passages in Aristophanes: first in the prologue of the *Acharnians* (which was acted in 425, 31 years after the poet's death), where the citizen, grumbling about his griefs and troubles, relates his great disappointment, when he took his seat in the theatre "expecting Aeschylus," to find that when the play came on it was Theognis; and secondly in a scene of the *Frogs* (acted 405 B.C.), where the throne of poetry is contested in Hades between Aeschylus and Euripides, the former complains (*Frogs*, 866) that "the battle is not fair, because my own poetry has not died with me, while Euripides' has died, and therefore *he will have it with him to recite*"—a clear reference, as the scholiast points out, to the continued production at Athens of Aeschylus' plays after his death.

Apart from fables, guesses and blunders, of which a word is said below, the only other incidents recorded of the poet's life that deserve mention are connected with his Sicilian visits, and the charge preferred against him of revealing the "secrets of Demeter."

This tale is briefly mentioned by Aristotle (*Ethics*, iii. 2), and a late commentator (Eustratius, 12th century) quotes from one Heracleides Ponticus the version which may be briefly given as follows:

The poet was acting a part in one of his own plays, where there was a reference to Demeter. The audience suspected him of revealing the inviolable secrets, and rose in fury; the poet fled to the altar of Dionysus in the orchestra and so saved his life for the moment; for even an angry Athenian crowd respected the inviolable sanctuary.

He was afterward charged with the crime before the Areopagus, and his plea "that he did not know that what he said was secret" was accepted by the court and secured his acquittal. The commentator adds that the prowess of the poet (and his brother) at Marathon was the real cause of the leniency of his judges. The story was afterward developed, and embellished by additions; but as the main fact seems accepted by Aristotle, it is probably authentic in the above shape.

As to his foreign travel, the suggestion has been made that certain descriptions in the *Persae*, and the known fact that he wrote a trilogy on the story of the Thracian king Lycurgus, persecutor of Dionysus, seem to point to his having a special knowledge of Thrace, which makes it likely that he had visited it. This, however, remains at best a conjecture. For his repeated visits to Sicily, on the other hand, there is conclusive ancient evidence.

Hiero I, tyrant of Syracuse, who reigned about 12 years (478–467), and among other efforts at magnificence invited to his court famous poets and men of letters, had founded a new town, Aetna, on the site of Catana which he captured, expelling the inhabitants. Among his guests were Aeschylus, Pindar, Bacchylides and Simonides. About 476 Aeschylus was entertained by him, and at his request wrote and exhibited a play called *The Women of Aetna* in honour of the new town. He paid a second visit about 472, the year in which he had produced the *Persae* at Athens, and the play is said to have been repeated at Syracuse at his patron's request.

Hiero died in 467, the year of the *Seven against Thebes;* but after 458, when the *Oresteia* was exhibited at Athens, we find the poet again in Sicily for the last time. In 456 he died and was buried at Gela; on his tomb was placed an epitaph in two elegiac couplets saying: "Beneath this stone lies Aeschylus, son of Euphorion, the Athenian, who perished in the wheat-bearing land of Gela; of his noble prowess the grove of Marathon can speak, or the long-haired Persian who knows it well." The authorship of this epitaph is uncertain, as the *Life* says it was inscribed on his grave by the people of Gela, while Athenaeus and Pausanias attribute it to Aeschylus. Probably most people would agree that only the poet himself could have praised the soldier and kept silent about the poetry.

Of the marvellous traditions which gathered round his name little need be said. Pausanias' tale, how Dionysus appeared to the poet when a boy, asleep in his father's vineyard, and bade him write a tragedy—or the account in the *Life*, how he was killed by an eagle letting fall on his head a tortoise whose shell the bird was unable to crack—clearly belong to the same class of legends as the story that Plato was son of Apollo, and that a swarm of bees settled upon his infant lips as he lay in his mother's arms Less supernatural, but hardly more historical, is the statement in the *Life* that the poet left Athens for Sicily in consequence of his defeat in the dramatic contest of 468 by Sophocles; or the alternative story of the same authority that the cause of his chagrin was that Simonides' elegy on the heroes slain at Marathon was preferred to his own.

Apart from the inherent improbability of such pettiness in such a man, neither story fits the facts, for in 467, the next year following Sophocles' success, it is known that Aeschylus won the prize of tragedy with the *Septem;* and the Marathon elegy must have been written in 490, 14 years before his first visit to Sicily.

**Aeschylus' Plays.**—In passing from Aeschylus' life to his work, we have obviously far more trustworthy data, in the 7 extant plays (with the fragments of more than 70 others), and particularly in the invaluable help of Aristotle's *Poetics*. The real importance of our poet in the development of the drama (*see* DRAMA: *Greek*) as compared with his predecessors is shown by the fact that Aristotle, in his brief review of the rise of tragedy (*Poetics*, iv, 13), names no one before Aeschylus.

He recognizes, it is true, a long process of growth, with several stages, from the dithyramb to the drama; and it is not difficult to see what these stages were. The first step was the addition to the old choric song of an interlude spoken, and in early days improvised, by the leader of the chorus (*Poetics*, iv, 12). The next was the introduction of an actor (literally, an "answerer"), to reply to the leader; and thus we get dialogue added to recitation.

The "answerer" was at first the poet himself (Aristotle, *Rhetoric*, iii, 1). This change is traditionally attributed to Thespis (533 B.C.), who is, however, not mentioned by Aristotle. The mask, to enable the actor to assume different parts, by whomsoever invented, was in regular use before Aeschylus' day. The third change was the enlarged range of subjects. The lyric dithyramb tales were necessarily about Dionysus, and the interludes had, of course, to follow suit. Nothing in the world so tenaciously resists innovation as religious ceremony, and it is interesting to learn that the Athenian populace (then, as ever, eager for "some new thing") nevertheless opposed at first the introduction of other tales:

But the innovators won, or otherwise there would have been no Attic drama.

In this way, then, to the original lyric song and dances in honour of Dionysus was added a spoken (but still metrical) interlude by the chorus leader, and later a dialogue with one actor (at first the poet), whom the mask enabled to appear in more than one part.

Nevertheless, all the evidence points to the fact that in the development of the drama Aeschylus was the decisive innovator.

The two things that were important, when the 5th century began, if tragedy was to realize its possibilities, were (1) the disentanglement of the dialogue from its position as an interlude in an artistic and religious pageant that was primarily lyric; and (2) its general elevation of tone. Aeschylus, as we know on the express authority of Aristotle (*Poetics*, iv, 13), achieved the first by the introduction of the second actor; and though he did not begin the second he gave to it the decisive impulse and consum-

mation by the overwhelming effect of his serious thought, the stately splendour of his style, his high dramatic purpose, and the artistic grandeur and impressiveness of the construction and presentment of his tragedies.

As to the importance of the second actor no argument is needed. The interacting personal influences of different characters on each other are indispensable to anything that can be called a play, as we understand the word; and, without two "personae dramatis" at the least, the drama in the strict sense is clearly impossible. The number of actors was afterwards increased; but to Aeschylus is due the essential step; and therefore, as was said above, he deserves, in a very real sense, to be called the founder of Athenian tragedy.

Of the seven extant plays, *Supplices, Persae, Septem contra Thebas, Prometheus, Agamemnon, Choephoroe* and *Eumenides,* five can be dated with certainty, as the archon's name is preserved in the Arguments; and the other two approximately. The dates rest, in the last resort, on the *didaskalia,* or the official records of the contests, of which Aristotle (and others) compiled catalogues; and some actual fragments have been recovered. The order of the plays is probably that given above; and certainly the *Persae* was acted in 472, *Septem* in 467, and the trilogy in 458. The *Supplices* is generally regarded as the oldest; and the best authorities tend to place it not far from 490. The early date is strongly confirmed by three things: the extreme simplicity of the plot, the choric (instead of dramatic) opening, and the fact that the percentage of lyric passages is 54, or the highest of all the seven plays. The chief doubt is in regard to *Prometheus,* but the very low percentage of lyrics (only 27, or roughly a quarter of the whole), and still more the strong characterization, a marked advance on anything in the first three plays, point to its being later than any except the trilogy, and suggest a date somewhere about 460, or perhaps a little earlier. A few comments on the extant plays will help to indicate the main points of Aeschylus' work.

**Supplices.**—The exceptional interest of the *Supplices* is due to its date. Being nearly 20 years earlier than any other extant play, it furnishes evidence of a stage in the evolution of Attic drama which would otherwise have been unrepresented It probably resembles in general structure the lost works of Choerilus, Phrynichus, Pratinas and the 6th century pioneers of drama.

The plot is briefly as follows: the 50 daughters of Danaus (who are the chorus), betrothed by Aegyptus (their father's brother) to his 50 sons, flee with Danaus to Argos, to escape the marriage. They claim the protection of the Argive king, Pelasgus; and he (by a pleasing anachronism) refers the matter to the people, who agree to protect the fugitives. The pursuing fleet of suitors is seen approaching; the herald arrives, orders off the cowering Danaids to the ships and finally attempts to drag them away. Pelasgus interposes with a force, drives off the Egyptians and saves the suppliants. Danaus urges them to prayer, and the grateful chorus pass away to the shelter offered by their protectors.

It is clear that we have here the drama just developing out of the lyric pageant. The interest still centres round the chorus. Character and plot—the two essentials of drama—are both here rudimentary. The play is a single situation. It should not be forgotten, indeed, that the play is one of a trilogy—an act, therefore, rather than a complete drama. But we have only to compare it with those later plays of which the same is true, to see the difference. Even in a trilogy, each play is a complete whole in itself, though also a portion of a larger whole.

**Persae.**—The next play that has survived is the *Persae,* the only extant Greek historical drama. The plot is still severely simple, though more developed than that of the *Supplices.* The opening is still lyric, and the first quarter of the play brings out, by song and speech, the anxiety of the people and queen as to the fate of Xerxes' huge army. Then comes the messenger with the news of Salamis, including a description of the sea-fight itself which can only be called magnificent. The play is not a tragedy in the true Greek sense; its real aim is not the "pity and terror" of the developed drama; it is the triumphant glorification of Athens, the exultation of the whole nation gathered in one place, over the ruin of their foe; and one effective incident is the raising of Darius's ghost, and his prophecy of the disastrous battle of Plataea. But in the ghost's revelations there is a mixture of audacity and naïveté, characteristic at once of the poet and the early youth of the drama.

**Septem Contra Thebas.**—Three years later came the Theban tragedy, which is (like the *Supplices*) one of a connected series, dealing with the evil fate of the Theban house, and traces the fate through three generations, Laius, Oedipus and the two sons who die by each other's hands in the fight for the Theban sovereignty. This family fate, where one evil deed leads to another after many years, is a larger conception, strikingly suited to Aeschylus' genius, and constitutes a notable stage in the development of the Aeschylean drama. In the last extant work, the *Oresteia,* the poet traces the tragedy of the Pelopid family, from Agamemnon's first sin to Orestes' vengeance and purification. And the names of several lost plays point to similar handling of the tragic trilogy.

The *Seven against Thebes* is the last play of its series; and again the plot is severely simple Father and grandfather have both perished miserably; and the two princes both claim the kingdom. Eteocles has driven out Polyneices, who fled to Argos, gathered a host under seven leaders (himself being one), and when the play opens has begun the siege of his own city. The king appears, warns the people, chides the clamour of women, appoints seven Thebans, including himself, to defend the seven gates, departs to his post, meets his brother in battle and both are killed. The other chieftains are all slain, and the enemy beaten off. The two dead princes are buried by their two sisters, who alone are left of the royal house.

Various signs of the early drama are here manifest. Half the play is lyric; there is no complication of plot; the whole action is recited by messengers; and the predicted mutual slaughter of the princes is brought about by no accidental stroke of destiny, but by the choice of the king, Eteocles himself. On the other hand, the opening is no longer lyric (like the two earlier plays) but dramatic; the main scene, where the king appoints the seven defenders, must have been an impressive spectacle. One novelty should not be overlooked. There is here the first passage of *dianoia,* or general reflection of life, which later became a regular feature of tragedy. Eteocles muses on the fate which involves an innocent man in the company of the wicked so that he shares unjustly their deserved fate (*Theb.* 597–608). The whole part of Eteocles shows a new effort of the poet to draw character, which may have something to do with the rise of Sophocles, who in the year before (468) won the prize of tragedy. There remain only the *Prometheus* and the *Oresteia,* which show such marked advance that (it may almost be said) when we think of Aeschylus it is these four plays we have in mind.

**Prometheus.**—The Prometheus-trilogy consisted of three plays: *Prometheus the Fire-bringer, Prometheus Bound, Prometheus Unbound.* The two last necessarily came in that order; the *Fire-bringer* is probably the first of the trilogy. That Prometheus sinned against Zeus, by stealing fire from heaven; that he was punished by fearful tortures for ages; that he was finally reconciled to Zeus and set free—all this was the ancient tale indisputably. Those who hold the *Fire-bringer* (Πυρφόρος) to be the final play, conjecture that it dealt with the establishment of the worship of Prometheus under that title, which is known to have existed at Athens. But the other order is on all grounds more probable; it keeps the natural sequence—crime, punishment, reconciliation, which is also the sequence in the *Oresteia.* And if the reconciliation was achieved in the second play, no scheme of action sufficing for the third drama seems even plausible.[1]

The play that survives is a poem of unsurpassed force and impressiveness. Nevertheless, from the point of view of the

[1]The *Eumenides* is quoted as a parallel, because there the establishment of this worship at Athens concludes the whole trilogy; but it is forgotten that in *Eumenides* there is much besides—the pursuit of Orestes, the refuge at Athens, the trial, the acquittal, the conciliation by Athena of the Furies; while here the story would be finished before the last play began.

development of drama, there seems at first sight little scope in the story for the normal human interest of a tragedy, since the actors are all divine, except Io, and between the opening where Prometheus is nailed to the Scythian rock, and the close where the earthquake engulfs the rock, the hero and the chorus, action in the ordinary sense is *ipso facto* impossible. This is just the opportunity for the poet's bold inventiveness and fine imagination.

Oceanus, the well-meaning palavering old mentor, and Hermes, the blustering and futile jack-in-office, gods though they be, are vigorous, audacious and very human character-sketches; the soft entrance of the consoling nymphs is unspeakably beautiful; and the prophecy of Io's wanderings is a striking example of that new keen interest in the world outside which was felt by the Greeks of the 5th century, as it was felt by the Elizabethan English in a very similar epoch of national spirit and enterprise 2,000 years later. Thus, though dramatic action is by the nature of the case impossible for the hero, the visitors provide real drama.

Another important point in the development of tragedy is what we may call the "balanced issue" The hero is both a victim and a rebel. He is punished for his benefits to man; but though Zeus is tyrannous, the hero's reckless defiance is shocking to Greek feeling. As the play goes on, this is subtly indicated by the attitude of the chorus. They enter overflowing with pity. They are slowly alienated by the hero's impiety; but they decline, at the last crisis, the mean advice of Hermes to desert Prometheus; and in the final crash they share his fate.

**Oresteia.**—The last and greatest work of Aeschylus is the *Oresteia,* which also has the interest of being the only complete trilogy preserved to us. As in *Prometheus,* the plot, at first sight, is such that the conditions of drama seem to exclude much development in character-drawing. The gods are everywhere at the root of the action. The inspired prophet, Calchas, has demanded the sacrifice of the king's daughter, Iphigeneia, to appease the offended Artemis. The inspired Cassandra, brought in as a spear-won slave from conquered Troy, reveals the murderous past of the Pelopid house, and the imminent slaughter of the king by his wife. Apollo orders the son, Orestes, to avenge his father by killing the murderess, and protects him when after the deed he takes sanctuary at Delphi. The Erinyes ("Furies") pursue him over land and sea; and at last Athena gives him shelter at Athens, summons an Athenian council to judge his guilt, and when the court is equally divided gives her casting vote for mercy. The last act ends with the reconciliation of Athena and the Furies; and the latter receive a shrine and worship at Athens, and promise favour and prosperity to the great city. The scope for human drama seems deliberately restricted by such a story so handled. Nevertheless, the growth of characterization is not only visible but remarkable. Clytaemnestra is one of the most powerfully presented characters of the Greek drama. And there is one other noticeable point. In this trilogy, Aeschylus, for the first time, has attempted some touches of character in two of the humbler parts, the watchman in *Agamemnon,* and the nurse in the *Choephoroe.* These two are veritable figures drawn from contemporary life; and though both appear only once, the innovation is most significant, and especially as adapted by Aeschylus.

**Aeschylus' Characteristics.**—It remains to say a word on two more points: the religious ideas of Aeschylus and some of the main characteristics of his poetry. The religious aspect of the drama in one sense was prominent from the first. But the new spirit imported by the genius of Aeschylus was religious in a profounder meaning of the term. The sadness of human lot, the power and mysterious dealings of the gods, their terrible and inscrutable wrath and jealousy (*aga* and *phthonos*), their certain vengeance upon sinners, all the more fearful if delayed—such are the poet's constant themes, especially in the *Oresteia.* And at times, particularly in the *Trilogy,* in his reference to the divine power of Zeus, he almost approaches a stern and sombre monotheism

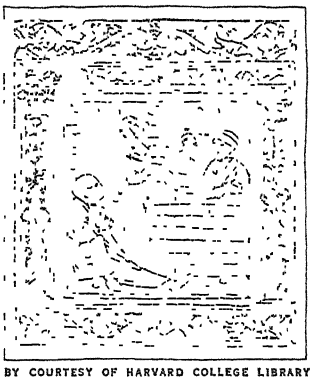
One specially noteworthy point in the *Agamemnon* is his explicit repudiation of the common Hellenic view that prosperity brings ruin. In other places he seems to share the feeling, but here (*Ag.* 730) he goes deeper, and declares that it is not ὄλβος but always wickedness that brings about men's fall. All through there is a recurring note of *fear* in his view of man's destiny In one remarkable passage of the *Eumenides* (517–525) this fear is extolled as a moral power which ought to be enthroned in men's hearts, to deter them from impious acts or from the pride that impels them to such sins.

Of the poetic qualities of Aeschylus' drama and diction, both in the lyrics and the dialogue, the briefest word must here suffice. He is everywhere distinguished by grandeur and power of conception, presentation and expression, and most of all in the latest works, the *Prometheus* and the *Trilogy* He is pre-eminent in depicting the slow approach of fear, as in the *Persae;* the imminent horror of impending fate, as in the broken cries and visions of Cassandra in the *Agamemnon* (1072–1177), the long lament and prayers to the nether powers in the *Choephoroe* (315–478), and the gradual rousing of the slumbering Furies in the *Eumenides* (117–139) The fatal end in these tragedies is foreseen, but the effect is due to its measured advance, to the slowly darkening suspense which no poet has more powerfully rendered Again, he is a master of contrasts, as when the floating vision of consoling nymphs appears to the tortured Prometheus (115–135); or the unmatched lyrics which tell (in the *Agamemnon,* 228–247) of the death of Iphigeneia; or the vision of his lost love that the night brings to Menelaus (410–426). And not least noticeable is the extraordinary range, force and imaginativeness of his diction. One example of his lyrics may be given which will illustrate more than one of these points. It is taken from the lament in the *Septem,* sung by the chorus and the two sisters, while following the funeral procession of the princes (*Sept.* 854–860):—

> Nay, with the wafting gale of your sighs, my sisters,
> Beat on your heads with your hands the stroke as of oars,
> The stroke that passes ever across Acheron,
> Speeding on its way the black-robed sacred bark,—
> The bark Apollo comes not near,
> The bark that is hidden from the sunlight—
> To the shore of darkness that welcomes all! (A. Sı.)

BIBLIOGRAPHY.—*Authorities:* The chief authority for the text is a single ms. at Florence, of the early 11th century, known as the Medicean or M., written by a professional scribe and revised by a contemporary scholar, who corrected the copyist's mistakes, added the scholia, the arguments and the *dramatis personae* of three plays (*Theb., Agam., Eum.*), and at the end of the *Life of Aeschylus* and the *Catalogue* of his dramas. The ms. has also been further corrected by later hands. In 1896 the Italian Ministry of Public Instruction published the ms. in photographic facsimile, with an instructive preface by Signor Rostagno. Besides M. there are some eight later mss. (13th to 15th century), and numerous copies of the three select plays (*Sept., Pers., Prom.*) which were most read in the later Byzantine period. These later mss. are of little value.

*Editions.*—The three first printed copies (Aldine, 1518; Turnebus and Robortello, 1552) give only those parts of *Agamemnon* found in M., from which ms. some leaves were lost; in 1557 the full text was restored by Vettori (Victorius) from later mss. After these four, the chief editions of the seven plays were those of Schütz, Porson, Butler, Wellauer, Dindorf, Bothe, Ahrens, Paley, Hermann, Hartung, Weil, Merkel, Kirchhoff and Wecklein. Editions of separate plays, special studies, etc. Wilamowitz-Moellendorf, Enger, Conington, Blaydes, Cobet, Meineke, Madvig, Ellis, W. Headlam, Davies, Tucker, Verrall, Haigh and Hoernle. The *Fragments* have been edited by Nauck and also by Wecklein. The Aeschylean staging is discussed in Albert Müller's *Lehrbuch der griechischen Bühnenalterthümer;* in "Die Bühne des Aeschylos," by Wilamowitz (*Hermes,* xxi.); in Smith's *Dict. of Antiquities,* art. "Theatrum" (R. C. Jebb); in Dörpfeld and Reisch (*Das griechische Theater*), Haigh's *Attic Theatre,* and Gardner and Jevons' *Manual of Greek Antiquities.* English verse translations: *Agamemnon,* Milman and R. Browning; *Oresteia, Suppliants, Persae, Seven against Thebes, Prometheus Vinctus,* by E. D. A. Morshead; *Prometheus,* E. B. Browning; the whole seven plays, Lewis Campbell. *Oresteia* by G. Murray, by R. C. Trevelyan, by G. M. Cookson; prose translation by W. G. and C. E. S. Headlam.



**AESCULAPIUS,** the Latin form of ASKLEPIOS (Ἀσκλήπιος) the name of the Greek god of medicine, the son of Apollo and the nymph Coronis. He probably came from Thessaly. The centaur Cheiron taught him the art of healing. At length Zeus, who, being afraid that he might render all men immortal, slew him with a thunderbolt (Apollodorus iii. 10; Pindar, *Phthia,* 3; Diod. Sic. iv.

71) Homer mentions him as a skilful physician, whose sons, Machaon and Podaleirius, are physicians in the Greek camp before Troy (*Iliad,* ii. 731). Temples were erected to Asklepios in many parts of Greece, near healing springs or on high mountains. The practice of sleeping (*incubatio*) in these sanctuaries was very common, it being supposed that the god effected cures or prescribed remedies to the sick in dreams All who were healed offered sacrifice (especially a cock) and hung up votive tablets, recording their names, their diseases, and the manner in which they had been cured Many of these tablets have been discovered at Epidaurus, the god's most famous shrine Herodas (*Mimes,* 4) gives a description of one of his temples, and of the offerings made to him The cult of Asklepios was introduced into Rome by order of the Sibylline books (293 B.C.), to avert a pestilence The god was fetched from Epidaurus in the form of a snake and a temple assigned him on an island in the Tiber (Livy x. 47; Ovid, *Metam* xv. 622). Asklepios is commonly represented standing, dressed in a long cloak, with bare breast, his usual attribute is a club-like staff with a serpent coiled round it. He is often accompanied by Telesphorus, the boy genius of healing, and his daughter, Hygieia, the goddess of health. Votive reliefs representing such groups have been found near the temple of Asklepios at Athens.

**AESERNIA** (mod. *Isernia,* Italy), Samnite town 58 mi. N E. of Beneventum on the road to Corfinium, at the junction of a road past Venafrum to the Via Latina. These routes are all followed by railways to Campobasso, Sulmona and Caianello. A Roman colony from 263 B.C., it became the headquarters of the Italian revolt after the loss of Corfinium, and was only recovered by Sulla at the end of the war, in 80 B.C. Massive ancient walls serve as foundation to modern ones.

**AESOP** (Gr. Αἴσωπος), author of *Fables* about animals, generally with a didactic purpose, which have given their name to a whole class of stories, is supposed to have lived from about 620 to 560 B.C. The place of his birth is uncertain. He was the slave of Iadmon of Samos and met with a violent death at the hands of the inhabitants of Delphi. When a pestilence came upon them, the Delphians offered [illegible] for his death, and the [illegible] claimed by Iadmon, grandson of his old master. Herodotus, who is authority for this (ii. 134), does not state the cause of Aesop's death; various reasons are assigned by later writers—his insulting sarcasms, the embezzlement of money entrusted to him by Croesus for distribution at Delphi (Schol Ar. Vesp. 1446), the theft of a silver cup.

AESOP, SITTING IN THE DOORWAY, RECOUNTING ONE OF HIS FAMOUS TALES

Reproduced after the woodcut in "Aesopi vita latine cum versione italica," etc., printed in Venice, March 27, 1492

Aesop must have been freed by Iadmon, or he could not have conducted the public defense of a Samian demagogue (Aristotle, *Rhetoric,* ii. 20). Legend says that he afterwards lived at the court of Croesus, where he met Solon, and dined in the company of the Seven Sages of Greece with Periander at Corinth. But it is impossible to say whether there is any grain of fact in this confused chronology. During the reign of Peisistratus he is said to have visited Athens, on which occasion he related the fable of *The Frogs asking for a King,* to dissuade the citizens from changing Peisistratus for another ruler.

The current stories about him are derived from a life, or rather romance, prefixed to a book of fables, purporting to be his, collected by Maximus Planudes, a monk of the 14th century. This describes him as ugly and deformed, as he is represented in the marble figure in the Villa Albani at Rome. That this life, however, was in existence a century before Planudes, appears from a 13th-century ms. of it found at Florence. In Plutarch's *Symposium of the Seven Sages,* at which Aesop is a guest, there are [illegible] original servile condition, but nothing derogatory is said about his personal appearance. We are further told that the Athenians set up a noble statue of him by Lysippus, which furnishes a strong argument against the fiction of his deformity. The obscurity in which the history of Aesop is involved has induced some scholars to deny his existence altogether

It is probable that Aesop did not commit his fables to writing (*Wasps,* 1259; Plato, *Phaedo,* 61 b). Demetrius of Phalerum (345–283 B.C.) made a collection in ten books, probably in prose, which has been lost Next appeared an edition in elegiac verse, cited by Suidas, but the author's name is unknown. Babrius, a Roman, turned the fables into choliambics in the earlier part of the 3rd century A.D. The most celebrated of the Latin adapters is Phaedrus, a freedman of Augustus. Avianus (of uncertain date, perhaps the 4th century) translated 42 fables into Latin elegaics. The collections, which we possess under the name of *Aesop's Fables,* are late renderings of Babrius's version, or Babrius was translated into Syriac, and back again into Greek. Ignatius Diaconus, in the 9th century, made a version of 53 fables in choliambic tetrameters. Stories from Oriental sources were added, and from these collections Maximus Planudes made and edited the collection which has come down to us under the name of Aesop, and from which the popular fables of modern Europe have been derived.

BIBLIOGRAPHY.—For further information *see* the article FABLE; Bentley, *Dissertation on the Fables of Aesop;* Du Méril, *Poésies inédites du moyen âge* (1854); J. Jacobs, *The Fables of Aesop* (1889); I. The history of the Aesopic fable; ii. The Fables of Aesop, as first printed by William Caxton (1484), from his French translation; Hervieux, *Les Fabulistes Latins* (1893–99). Before any Greek text appeared, a Latin translation of 100 *Fabulae Aesopicae* by an Italian scholar named Ranuzio (Renutius) was [illegible] Rome, 1476. About 1480 the collection of Planudes [illegible] at Milan by Buono Accorso (Accursius), together with Ranuzio's translation. This edition, which contained 144 fables, was frequently reprinted and additions were made from time to time from various mss—the Heidelberg (Palatine), Florentine, Vatican and Augsburg—by Stephanus (1547), Nevelet (1610), Hudson (1718), Wagenaar (1741), Furia (1810), Coray (1810), Schneider (1812) and others. A critical edition of all the previously known fables, prepared by Carl von Halm from the collations of Furia, Coray and Schneider, was published in the Teubner series of Greek and Latin texts. A *Fabularum Aesopicarum sylloge* (233 in number) from a Paris ms., with critical notes by Sternbach, appeared in a Cracow university publication, *Rozprawy akademii umiejetnosci* (1894).

**AESOPUS,** a Greek historian who wrote a history of Alexander the Great, a Latin translation of which, by Julius Valerius, was discovered by Mai in 1816. He is known as the pseudo-Callisthenes.

(*See* the references *s.v.* CALLISTHENES)

**AESOPUS, CLODIUS,** Roman tragedian, flourished in the first century B.C.

Cicero was on friendly terms with him. Aesopus made a last appearance in 55 B.C.—when Cicero tells us that he was advanced in years—on the occasion of the splendid games given by Pompey at the dedication of his theatre.

Horace (*Sat.* iii. 3. 239) mentions his taking a pearl from the ear-drop of Caecilia Metella and dissolving it in vinegar, that he might have the satisfaction of swallowing eight thousand pounds' worth at a draught.

**AESTHETICS.** If we examine a poem in order to determine what it is that makes us feel it to be a poem, we at once find two constant and necessary elements: a complex of *images,* and a *feeling* that animates them. Let us, for instance, recall a passage learnt at school: Virgil's lines (*Aeneid,* iii., 294, *sqq.*), in which Aeneas describes how on hearing that in the country to whose shores he had come the Trojan Helenus was reigning, with Andromache, now his wife, he was overcome with amazement

and a great desire to see this surviving son of Priam and to hear of his strange adventures. Andromache, whom he meets outside the walls of the city, by the waters of a river renamed Simois, celebrating funeral rites before a cenotaph of green turf and two altars to Hector and Astyanax; her astonishment on seeing him, her hesitation, the halting words in which she questions him, uncertain whether he is a man or a ghost; Aeneas's no less agitated replies and interrogations, and the pain and confusion with which she recalls the past—how she lived through scenes of blood and shame, how she was assigned by lot as slave and concubine to Pyrrhus, abandoned by him and united to Helenus, another of his slaves, how Pyrrhus fell by the hand of Orestes and Helenus became a free man and a king; the entry of Aeneas and his men into the city, and their reception by the son of Priam in this little Troy, this mimic Pergamon with its new Xanthus, and its Scaean Gate whose threshold Aeneas greets with a kiss—all these details, and others here omitted, are images of persons, things, attitudes, gestures, sayings, joy and sorrow; mere images, not history or historical criticism, for which they are neither given nor taken. But through them all there runs a feeling, a feeling which is our own no less than the poet's, a human feeling of bitter memories, of shuddering horror, of melancholy, of homesickness, of tenderness, of a kind of childish *pietas* that could prompt this vain revival of things perished, these playthings fashioned by a religious devotion, the *parva Troia,* the *Pergama simulata magnis,* the *arentem Xanthi cognomine rivum:* something inexpressible in logical terms, which only poetry can express in full. Moreover, these two elements may appear as two in a first abstract analysis, but they cannot be regarded as two distinct threads, however intertwined; for, in effect, the feeling is altogether converted into images, into this complex of images, and is thus a feeling that is contemplated and therefore resolved and transcended. Hence poetry must be called neither feeling, nor image, nor yet the sum of the two, but "contemplation of feeling" or "lyrical intuition" or (which is the same thing) "pure intuition"—pure, that is, of all historical and critical reference to the reality or unreality of the images of which it is woven, and apprehending the pure throb of life in its ideality. Doubtless, other things may be found in poetry besides these two elements or moments and the synthesis of the two; but these other things are either present as extraneous elements in a compound (reflections, exhortations, polemics, allegories, etc.), or else they are just these image-feelings themselves taken in abstraction from their context as so much material, restored to the condition in which it was before the act of poetic creation. In the former case, they are non-poetic elements merely interpolated into or attached to the poem; in the latter, they are divested of poetry, rendered unpoetical by a reader either unpoetical or not at the moment poetical, who has dispelled the poetry, either because he cannot live in its ideal realm, or for the legitimate ends of historical enquiry or other practical purposes which involve the degradation —or rather, the conversion—of the poem into a document or an instrument.

**Artistic Qualities.**—What has been said of "poetry" applies to all the other "arts" commonly enumerated; painting, sculpture, architecture, music. Whenever the artistic quality of any product of the mind is discussed, the dilemma must be faced, that either it is a lyrical intuition, or it is something else, something just as respectable, but not art. If painting (as some theorists have maintained) were the imitation or reproduction of a given object, it would be, not art, but something mechanical and practical; if the task of the painter (as other theorists have held) were to combine lines and lights and colours with ingenious novelty of invention and effect, he would be, not an artist, but an inventor; if music consisted in similar combinations of notes, the paradox of Leibniz and Father Kircher would come true, and a man could write music without being a musician; or alternatively we should have to fear (as Proudhon did for poetry and John Stuart Mill for music) that the possible combinations of words or notes would one day be exhausted, and poetry or music would disappear. As in poetry, so in these other arts, it is notorious that foreign elements sometimes intrude themselves; foreign either *a parte objecti* or *a parte subjecti,* foreign either in fact or from the point of view of an inartistic spectator or listener. Thus the critics of these arts advise the artist to exclude, or at least not to rely upon, what they call the "literary" elements in painting, sculpture and music, just as the critic of poetry advises the writer to look for "poetry" and not be led astray by mere literature. The reader who understands poetry goes straight to this poetic heart and feels its beat upon his own; where this beat is silent, he denies that poetry is present, whatever and however many other things may take its place, united in the work, and however valuable they may be for skill and wisdom, nobility of intellect, quickness of wit and pleasantness of effect. The reader who does not understand poetry loses his way in pursuit of these other things He is wrong not because he admires them, but because he thinks he is admiring poetry.

**Other Forms of Activity As Distinct from Art.**—By defining art as lyrical or pure intuition we have implicitly distinguished it from all other forms of mental production If such distinctions are made explicit, we obtain the following negations.

1 *Art is not philosophy,* because philosophy is the logical thinking of the universal categories of being, and art is the unreflective intuition of being. Hence, while philosophy transcends the image and uses it for its own purposes, art lives in it as in a kingdom. It is said that art cannot behave in an irrational manner and cannot ignore logic; and certainly it is neither irrational nor illogical; but its own rationality, its own logic, is a quite different thing from the dialectical logic of the concept, and it was in order to indicate this peculiar and unique character that the name "logic of sense" or "aesthetic" was invented The not uncommon assertion that art has a logical character, involves either an equivocation between conceptual logic and aesthetic logic, or a symbolic expression of the latter in terms of the former.

2. *Art is not history,* because history implies the critical distinction between reality and unreality; the reality of the fact and the reality of a fancied world: the reality of action and the reality of desire. For art, these distinctions are as yet unmade; it lives, as we have said, upon pure images. The historical existence of Helenus, Andromache and Aeneas makes no difference to the poetical quality of Virgil's poem. Here, too, an objection has been raised: namely that art is not wholly indifferent to historical criteria, because it obeys the laws of "verisimilitude"; but, here again, "verisimilitude" is only a rather clumsy metaphor for the mutual coherence of images, which without this internal coherence would fail to produce their effect as images, like Horace's *delphinus in silvis* and *aper in fluctibus.*

3. *Art is not natural science,* because natural science is historical fact classified and so made abstract; nor is it *mathematical science,* because mathematics performs operations with abstractions and does not contemplate. The analogy sometimes drawn between mathematical and poetical creation is based on merely external and generic resemblances; and the alleged necessity of a mathematical or geometrical basis for the arts is only another metaphor, a symbolic expression of the constructive, cohesive and unifying force of the poetic mind building itself a body of images.

4. *Art is not the play of fancy,* because the play of fancy passes from image to image, in search of variety, rest or diversion, seeking to amuse itself with the likenesses of things that give pleasure or have an emotional and pathetic interest; whereas in art the fancy is so dominated by the single problem of converting chaotic feeling into clear intuition, that we recognize the propriety of ceasing to call it fancy and calling it imagination, poetic imagination or creative imagination. Fancy as such is as far removed from poetry as are the works of Mrs. Radcliffe or Dumas *père.*

5. *Art Is Not Feeling in Its Immediacy.*—Andromache, on seeing Aeneas, becomes *amens, diriguit visu in medio, labitur, longo vix tempore fatur,* and when she speaks *longos ciebat incassum fletus;* but the poet does not lose his wits or grow stiff as he gazes; he does not totter or weep or cry; he expresses himself in harmonious verses, having made these various perturbations the object of which he sings. Feelings in their immediacy are "expressed"

for if they were not, if they were not also sensible and bodily facts ("psycho-physical phenomena," as the positivists used to call them) they would not be concrete things, and so they would be nothing at all. Andromache expressed herself in the way described above. But "expression" in this sense, even when accompanied by consciousness, is a mere metaphor from "mental" or "aesthetic expression" which alone really expresses, that is, gives to feeling a theoretical form and converts it into words, song and outward shape. This distinction between contemplated feeling, or poetry, and feeling enacted or endured, is the source of the power, ascribed to art, of "liberating us from the passions" and "calming" us (the power of *catharsis*), and of the consequent condemnation, from an aesthetic point of view, of works of art, or parts of them, in which immediate feeling has a place or finds a vent. Hence, too, arises another characteristic of poetic expression—really synonymous with the last—namely its "infinity" as opposed to the "finitude" of immediate feeling or passion; or, as it is also called, the "universal" or "cosmic" character of poetry. Feeling, not crushed but contemplated by the work of poetry, is seen to diffuse itself in widening circles over all the realm of the soul, which is the realm of the universe, echoing and re-echoing endlessly: joy and sorrow, pleasure and pain, energy and lassitude, earnestness and frivolity, and so forth, are linked to each other and lead to each other through infinite shades and gradations; so that the feeling, while preserving its individual physiognomy and its original dominating motive, is not exhausted by or restricted to this original character. A comic image, if it is poetically comic, carries with it something that is not comic, as in the case of Don Quixote or Falstaff; and the image of something terrible is never, in poetry, without an atoning element of loftiness, goodness and love.

6. *Art is not instruction or oratory:* it is not circumscribed and limited by service to any practical purpose whatever, whether this be the inculcation of a particular philosophical, historical or scientific truth, or the advocacy of a particular way of feeling and the action corresponding to it Oratory at once robs expression of its "infinity" and independence, and, by making it the means to an end, dissolves it in this end. Hence arises what Schiller called the "non-determining" character of art, as opposed to the "determining" character of oratory; and hence the justifiable suspicion of "political poetry"—political poetry being, proverbially, bad poetry.

7. As art is not to be confused with the form of practical action most akin to it, namely instruction and oratory, so *a fortiori,* it must not be confused with other forms directed to the production of certain effects, whether these consist in pleasure, enjoyment and utility, or in goodness and righteousness. We must exclude from art not only meretricious works, but also those inspired by a desire for goodness, as equally, though differently, inartistic and repugnant to lovers of poetry. Flaubert's remark that indecent books lacked *vérité,* is parallel to Voltaire's gibe that certain "poésies sacrées" were really "sacrées, car personne n'y touche."

**Art in Its Relations.**—The "negations" here made explicit are obviously, from another point of view, "relations"; for the various distinct forms of mental activity cannot be conceived as separate each from the rest and acting in self-supporting isolation. This is not the place to set forth a complete system of the forms or categories of the mind in their order and their dialectic; confining ourselves to art, we must be content to say that the category of art, like every other category, mutually presupposes and is presupposed by all the rest: it is conditioned by them all and conditions them all. How could the aesthetic synthesis, which is poetry, arise, were it not preceded by a state of mental commotion? *Si vis me flere, dolendum est,* and so forth. And what is this state of mind which we have called feeling, but the whole mind, with its past thoughts, volitions and actions, now thinking and desiring and suffering and rejoicing, travailing within itself? Poetry is like a ray of sunlight shining upon this darkness, lending it its own light and making visible the hidden forms of things. Hence it cannot be produced by an empty and dull mind; hence those artists who embrace the creed of pure art or art for art's sake, and close their hearts to the troubles of life and the cares of thought, are found to be wholly unproductive, or at most rise to the imitation of others or to an impressionism devoid of concentration Hence the basis of all poetry is human personality, and, since human personality finds its completion in morality, the basis of all poetry is the moral consciousness. Of course this does not mean that the artist must be a profound thinker or an acute critic; nor that he must be a pattern of virtue or a hero; but he must have a share in the world of thought and action which will enable him, either in his own persón or by sympathy with others, to live the whole drama of human life. He may sin, lose the purity of his heart, and expose himself, as a practical agent, to blame; but he must have a keen sense of purity and impurity, righteousness and sin, good and evil. He may not be endowed with great practical courage; he may even betray signs of timidity and cowardice; but he must feel the dignity of courage. Many artistic inspirations are due, not to what the artist, as a man, is in practice, but to what he is not, and feels that he ought to be admiring and enjoying the qualities he lacks when he sees them in others. Many, perhaps the finest, pages of heroic and warlike poetry are by men who never had the nerve or the skill to handle a weapon. On the other hand, we are not maintaining that the possession of a moral personality is enough to make a poet or an artist. To be a *vir bonus* does not make a man even an orator, unless he is also *dicendi peritus* The *sine qua non* of poetry is poetry, that form of [illegible] synthesis which we have defined above; the spark of poetical genius without which all the rest is mere fuel, not burning because no fire is at hand to light it. But the figure of the pure poet, the pure artist, the votary of pure Beauty, aloof from contact with humanity, is no real figure but a caricature.

That poetry not only presupposes the other forms of human mental activity but is presupposed by them, is proved by the fact that without the poetic imagination which gives contemplative form to the workings of feeling, intuitive expression to obscure impressions and thus becomes representations and words, whether spoken or sung or painted or otherwise uttered, logical thought could not arise. Logical thought is not language, but it never exists without language, and it uses the language which poetry has created; by means of concepts, it discerns and dominates the representations of poetry, and it could not dominate them unless they, its future subjects, had first an existence of their own. Further, without the discerning and criticizing activity of thought, action would be impossible; and if action, then good action, the moral consciousness, duty. Every man, however much he may seem to be all logical thinker, critic, scientist, or all absorbed in practical interests or devoted to duty, cherishes at the bottom of his heart his own private store of imagination and poetry; even Faust's pedantic *famulus,* Wagner, confessed that he often had his "grillenhafte Stunden." Had this element been altogether denied him, he would not have been a man, and therefore not even a thinking or acting being. This extreme case is an absurdity; but in proportion as this private store is scanty, we find a certain superficiality and aridity in thought, and a certain coldness in action.

**The Science of Art, or Aesthetics, and Its Philosophical Character.**—The concept of art expounded above is in a sense the ordinary concept, which appears with greater or less clarity in all statements about art, and is constantly appealed to, explicitly or implicitly, as the fixed point round which all discussions on the subject gravitate: and this, not only nowadays, but at all times, as could be shown by the collection and interpretation of things said by writers, poets, artists, laymen and even the common people. But it is desirable to dispel the illusion that this concept exists as an innate idea, and to replace this by the truth, that it operates as an *a priori* concept. Now an *a priori* concept does not exist by itself, but only in the individual products which it generates. Just as the *a priori* reality called Art, Poetry or Beauty does not exist in a transcendent region where it can be perceived and admired in itself, but only in the innumerable works of poetry, of art and of beauty which it has formed and continues to form, so the logical *a priori* concept of art exists nowhere but in the par-

ticular judgments which it has formed and continues to form, the refutations which it has effected and continues to effect, the demonstrations it makes, the theories it constructs, the problems and groups of problems, which it solves and has solved. The definitions and distinctions and negations and relations expounded above have each its own history, and have been progressively worked out in the course of centuries, and in them we now possess the fruits of this complex and unremitting toil. Aesthetic, or the science of art, has not therefore the task (attributed to it by certain scholastic conceptions) of defining art once for all and deducing from this conception its various doctrines, so as to cover the whole field of aesthetic science; it is only the perpetual systematization, always renewed and always growing, of the problems arising from time to time out of reflection upon art, and is identical with the solutions of the difficulties and the criticisms of the errors which act as stimulus and material to the unceasing progress of thought. This being so, no exposition of aesthetic (especially a summary exposition such as can alone be given here) can claim to deal exhaustively with the innumerable problems which have arisen and may arise in the course of the history of aesthetics; it can only mention and discuss the chief, and among these, by preference, those which still make themselves felt and resist solution in ordinary educated thought; adding an implied "et cetera," so that the reader may pursue the subject according to the criteria set before him, either by going again over old discussions, or by entering into those of to-day, which change and multiply and assume new shapes almost daily. Another warning must not be omitted. namely that aesthetics, though a special philosophical science, having as its principle a special and distinct category of the mind, can never, just because it is philosophical, be detached from the main body of philosophy; for its problems are concerned with the relations between art and the other mental forms, and therefore imply both difference and identity. Aesthetics is really the whole of philosophy, but with special emphasis on that side of it which concerns art Many have demanded or imagined or desired a self-contained aesthetics, devoid of any general philosophical implications, and consistent with more than one, or with any, philosophy; but the project is impossible of execution because self-contradictory. Even those who promise to expound a naturalistic, inductive, physical, physiological or psychological aesthetics—in a word, a non-philosophical aesthetics —when they pass from promise to performance surreptitiously introduce a general positivistic, naturalistic or even materialistic philosophy. And anyone who thinks that the philosophical ideas of positivism, naturalism and materialism are false and out of date, will find it an easy matter to refute the aesthetic or pseudo-aesthetic doctrines which mutually support them and are supported by them, and will not regard their problems as problems still awaiting solution or worthy of discussion—or, at least, protracted discussion. For instance, the downfall of psychological associationism (or the substitution of mechanism for *a priori* synthesis) implies the downfall not only of logical associationism but of aesthetics also, with its association of "content" and "form," or of two "representations," which (unlike Campanella's *tactus intrinsecus,* effected *cum magna suavitate*) was a *contactus extrinsecus* whose terms were no sooner united than they *discedebant.* The collapse of biological and evolutionary explanations of logical and ethical values implies the same collapse in the case of aesthetic value. The proved inability of empirical methods to yield knowledge of reality, which in fact they can only classify and reduce to types, involves the impossibility of an aesthetics arrived at by collecting aesthetic facts in classes and discovering their laws by induction.

**Intuition and Expression.**—One of the first problems to arise, when the work of art is defined as "lyrical image," concerns the relation of "intuition" to "expression" and the manner of the transition from the one to the other. At bottom this is the same problem which arises in other parts of philosophy: the problem of inner and outer, of mind and matter, of soul and body, and, in ethics, of intention and will, will and action, and so forth Thus stated, the problem is insoluble; for once we have divided the inner from the outer, body from mind, will from action, or intuition from expression, there is no way of passing from one to the other or of reuniting them, unless we appeal for their reunion to a third term, variously represented as God or the Unknowable. Dualism leads necessarily either to transcendence or to agnosticism But when a problem is found to be insoluble in the terms in which it is stated the only course open is to criticize these terms themselves, to inquire how they have been arrived at, and whether their genesis was logically sound In this case, such inquiry leads to the conclusion that the terms depend not upon a philosophical principle, but upon an empirical and naturalistic classification, which has created two groups of facts called internal and external respectively (as if internal facts were not also external, and as if an external fact could exist without being also internal), or souls and bodies, or images and expressions; and everyone knows that it is hopeless to try to find a dialectical unity between terms that have been distinguished not philosophically or formally but only empirically and materially. The soul is only a soul in so far as it is a body, the will is only a will in so far as it moves arms and legs, or is action; intuition is only intuition in so far as it is, in that very act, expression An image that does not express, that is not speech, song, drawing painting, sculpture or architecture—speech at least murmured to oneself, song at least echoing within one's own breast, line and colour seen in imagination and colouring with its own tint the whole soul and organism—is an image that does not exist. We may assert its existence, but we cannot support our assertion; for the only thing we could adduce in support of it would be the fact that the image was embodied or expressed This profound philosophical doctrine, the *identity of intuition and expression* is, moreover, a principle of ordinary common sense, which laughs at people who claim to have thoughts they cannot express or to have imagined a great picture which they cannot paint. *Rem tene, verba sequentur;* if there are no *verba,* there is no *res* This identity, which applies to every sphere of the mind, has in the sphere of art a clearness and self-evidence lacking, perhaps, elsewhere In the creation of a work of poetry, we are present, as it were, at the mystery of the creation of the world; hence the value of the contribution made by aesthetics to philosophy as a whole, or the conception of the One that is All. Aesthetics, by denying in the life of art an abstract spiritualism and the resulting dualism, prepares the way and leads the mind towards idealism or absolute spiritualism.

**Expression and Communication.**—Objections to the identity of intuition and expression generally arise from psychological illusions which lead us to believe that we possess at any given moment a profusion of concrete and lively images, when in fact we only possess signs and names for them; or else from faulty analysis of cases like that of the artist who is believed to express mere fragments of a world of images that exists in his mind in its entirety, whereas he really has in his mind only these fragments, together with—not the supposed complete world, but at most an aspiration or obscure working towards it, towards a greater and richer image which may take shape or may not. But these objections also arise from a confusion between *expression* and *communication,* the latter being really distinct from the image and its expression. Communication is the fixation of the intuition-expression upon an object metaphorically called material or physical; in reality, even here we are concerned not with material or physical things but with a mental process The proof that the so-called physical object is unreal, and its resolution into terms of mind, is primarily of interest for our general philosophical conceptions, and only indirectly for the elucidation of aesthetic questions; hence for brevity's sake we may let the metaphor or symbol stand and speak of matter or nature It is clear that the poem is complete as soon as the poet has expressed it in words which he repeats to himself. When he comes to repeat them aloud, for others to hear, or looks for someone to learn them by heart and repeat them to others as in a *schola cantorum,* or sets them down in writing or in printing, he has entered upon a new stage, not aesthetic but practical, whose social and cultural importance need not, of course, be insisted upon. So with the painter; he paints on his panel or canvas, but

he could not paint unless at every stage in his work, from the original blur or sketch to the finishing touches, the intuited image, the line and colour painted in his imagination, preceded the brush-stroke. Indeed, when the brush-stroke outruns the image, it is cancelled and replaced by the artist's correction of his own work. The exact line that divides expression from communication is difficult to draw in the concrete case, for in the concrete case the two processes generally alternate rapidly and appear to mingle, but it is clear in idea, and it must be firmly grasped Through overlooking it, or blurring it through insufficient attention, arise the confusions between *art* and *technique*. Technique is not an intrinsic element of art but has to do precisely with the concept of communication. In general it is a cognition or complex of cognitions disposed and directed to the furtherance of practical action, and, in the case of art, of the practical action which makes objects and instruments for the recording and communicating of works of art; *e g*, cognitions concerning the preparation of panels, canvases or walls to be painted, pigments, varnishes, ways of obtaining good pronunciation and declamation and so forth. Technical treatises are not aesthetic treatises, nor yet parts or chapters of them. Provided, that is, that the ideas are rigorously conceived and the words used accurately in relation to them it would not be worth while to pick a quarrel over the use of the word "technique" as a synonym for the artistic work itself, regarded as "inner technique" or the formation of intuition-expressions. The confusion between art and technique is especially beloved by impotent artists, who hope to obtain from practical things and practical devices and inventions the help which their strength does not enable them to give themselves.

**Artistic Objects: the Theory of the Special Arts, and the Beauty of Nature.**—The work of communicating and conserving artistic images, with the help of technique, produces the material objects metaphorically called *"artistic objects"* or *"works of art":* pictures, sculptures and buildings, and, in a more complicated manner, literary and musical writings, and, in our own times, gramophones and records which make it possible to reproduce voices and sounds. But neither these voices and sounds nor the symbols of writing, sculpture and architecture, are works of art; works of art exist only in the minds that create or recreate them. To remove the appearance of paradox from the truth that beautiful objects, beautiful things, do not exist, it may be opportune to recall the analogous case of economic science, which knows perfectly well that in the sphere of economics there are no naturally or physically *useful* things, but only demand and labour, from which physical things acquire, metaphorically, this epithet. A student of economics who wished to deduce the economic value of things from their physical qualities would be perpetrating a gross *ignoratio elenchi.*

Yet this same *ignoratio elenchi* has been, and still is, committed in aesthetic, by the theory of special *arts,* and the limits or peculiar aesthetic character of each The divisions between the arts are merely technical or physical, according as the artistic objects consist of physical sounds, notes, coloured objects, carved or modelled objects, or constructed objects having no apparent correspondence with natural bodies (poetry, music, painting, sculpture, architecture, etc.). To ask what is the artistic character of each of these arts, what it can and cannot do, what kinds of images can be expressed in sounds, what in notes, what in colours, what in lines, and so forth, is like asking in economics what things are entitled by their physical qualities to have a value and what are not, and what relative values they are entitled to have; whereas it is clear that physical qualities do not enter into the question, and anything may be desired or demanded or valued more than another, or more than anything else at all, according to circumstances and needs Even Lessing found himself slipping down the slope leading to this truth, and was forced to such strange conclusions as that actions belonged to poetry and bodies to sculpture; even Richard Wagner attempted to find a place in the list for a comprehensive art, namely Opera, including in itself by a process of aggregation the powers of all the arts. A reader with any artistic sense finds in a single solitary line from a poet at once musical and picturesque qualities, sculpturesque strength and architectural structure, and the same with a picture, which is never a mere thing of the eyes but an affair of the whole soul, and exists in the soul not only as colour but as sound and speech. But when we try to grasp these musical or picturesque or other qualities, they elude us and turn into each other, and melt into a unity, however we may be accustomed to distinguish them by different names; a practical proof that art is one and cannot be divided into arts. One, and infinitely varied; not according to the technical conceptions of the several arts, but according to the infinite variety of artistic personalities and their states of mind.

With this relation (and confusion) between artistic creations and instruments of communication or *objets d'art* must be connected the problem of *natural beauty.* We shall not discuss the question, raised by certain aestheticians, whether there are in nature other poets, other artistic beings, beside man; a question which ought to be answered in the affirmative not only out of respect for the song-birds, but, still more, out of respect for the idealistic conception of the world as life and spirituality throughout, even if (as the fairy-tale goes) we have lost the magic herb which when we put it in our mouth, gives us the power of understanding the language of animals and plants The phrase *natural beauty* properly refers to persons, things and places whose effect is comparable to that of poetry, painting, sculpture and the other arts There is no difficulty in allowing the existence of such "natural *objets d'art,*" for the process of poetic communication may take place by means of objects naturally given as well as by means of objects artificially produced. The lover's imagination creates a woman beautiful to him, and personifies her in Laura; the pilgrim's imagination creates the charming or sublime landscape, and embodies it in the scene of a lake or a mountain; and these creations of theirs are sometimes shared by more or less wide social circles, thus becoming the "professional beauties" admired by everyone and the famous "views" before which all experience a more or less sincere rapture. No doubt, these creations are mortal; ridicule sometimes kills them, satiety may bring neglect, fashion may replace them by others; and—unlike works of art—they do not admit of authentic interpretation. The bay of Naples, seen from the height of one of the most beautiful Neapolitan villas, was after some time described by the Russian lady who owned the villa as *une cuvette bleue,* whose blue encircled by green so wearied her that she sold the villa. But even the *cuvette bleue* was a legitimate poetical creation.

**Literary Kinds and Aesthetic Categories.**—Effects at once greater and more detrimental upon the criticism and historical study of art and literature have been produced by a theory of similar but slightly different origin, the theory of *literary and artistic kinds.* This, like the foregoing, is based on a classification in itself justifiable and useful. The foregoing is based on a technical or physical classification of artistic objects; this is based on a classification according to the feelings which form their content or motive, into *tragic, comic, lyrical, heroic, erotic, idyllic, romantic* and so on, with divisions and subdivisions. It is useful in practice to distribute an artist's works, for purposes of publication, into these classes, putting lyrics in one volume, dramas in another, poems in a third and romances in a fourth; and it is convenient, in fact, indispensable, to refer to works and groups of works by these names in speaking and writing of them. But here again we must deny and pronounce illegitimate the transition from these classificatory concepts to the poetic laws of composition and aesthetic criteria of judgment, as when people try to decide that a tragedy must have a subject of a certain kind, characters of a certain kind, a plot of a certain kind and a certain length; and, when confronted by a work, instead of looking for and appraising its own poetry, ask whether it is a tragedy or a poem, and whether it obeys the "laws" of one or other "kind." The literary criticism of the 19th century owed its great progress largely to its abandonment of the criteria of kinds, in which the criticism of the Renaissance and the French classicists had always been entangled, as may be seen from the discussions arising out of the poems of Dante, Ariosto and Tasso, Guarini's *Pastor fido,* Corneille's *Cid,* and Lope de Vega's *comedias.* Artists have profited by this liberation less than critics; for anyone with

artistic genius bursts the fetters of such servitude, or even makes them the instruments of his power; and the artist with little or no genius turns his very freedom into a new slavery

It has been thought that the divisions of kinds could be saved by giving them a philosophical significance; or at any rate one such division, that of lyric, epic and dramatic, regarded as the three moments of a process of objectification passing from the lyric, the outpouring of the ego, to the epic, in which the ego detaches its [illegible] itself by narrating it, and thence to the drama, in which it allows this feeling to create of itself its own mouthpieces, the *dramatis personae*. But the lyric is not a pouring-forth; it is not a cry or a lament; it is an objectification in which the ego sees itself on the stage, narrates itself, and dramatizes itself; and this lyrical spirit forms the poetry both of epic and of drama, which are therefore distinguished from the lyric only by external signs A work which is altogether poetry, like *Macbeth* or *Antony and Cleopatra*, is substantially a lyric in which the various tones and successive verses are represented by characters and scenes.

In the old aesthetics, and even to-day in those which perpetuate the type, an important place is given to the so-called categories of beauty: the *sublime*, the *tragic*, the *comic*, the *graceful*, the *humorous* and so forth, which German philosophers not only claimed to treat as philosophical concepts, whereas they are really mere psychological and empirical concepts, but developed by means of that dialectic which belongs only to pure or speculative concepts, philosophical categories. Thus they arranged them in an imaginary progress culminating now in the Beautiful, now in the Tragic, now in the Humorous Taking these concepts at their face value, we may observe their substantial correspondence with the concepts of the literary and artistic kinds; and this is the source from which, as excerpts from manuals of literature, they have found their way into philosophy As psychological and empirical concepts, they do not belong to aesthetics; and as a whole, in their common quality, they refer merely to the world of feelings, empirically grouped and classified, which forms the permanent matter of artistic intuition.

**Rhetoric, Grammar and Philosophy of Language.**—Every error has in it an element of truth, and arises from an arbitrary combination of things which in themselves are legitimate. This principle may be confirmed by an examination of other erroneous doctrines which have been prominent in the past and are still to a less degree prominent to-day. It is perfectly legitimate, in teaching people to write, to make use of distinctions like that between simple style, ornate style and metaphorical style and its forms, and to point out that here the pupil ought to express himself literally and there metaphorically, or that here the metaphor used is incoherent or drawn out to excessive length, and that here the figure of "preterition," there "hypotyposis" or "irony," would have been suitable. But when people lose sight of the merely practical and didactic origin of these distinctions and construct a philosophical theory of form as divisible into simple form and ornate form, logical form and affective form, and so forth, they are introducing elements of rhetoric into aesthetics and vitiating the true concept of expression. For expression is never logical, but always affective, that is lyrical and imaginative; and hence it is never metaphorical but always "proper"; it is never simple in the sense of lacking elaboration, or ornate in the sense of being loaded with extraneous elements; it is always adorned with itself, *simplex munditiis*. Even logical thought or science, so far as it is expressed, becomes feeling and imagination, which is why a philosophical or historical or scientific book can be not only true but beautiful, and must always be judged not only logically but also aesthetically. Thus we sometimes say that a book is a failure as theory, or criticism, or historical truth, but a success as a work of art, in view of the feeling animating it and expressed in it. As for the element of truth which is obscurely at work in this distinction between logical form and metaphorical form, dialectic and rhetoric, we may detect in it the need of a science of aesthetics side by side with that of logic; but it was a mistake to try to distinguish the two sciences within the sphere of expression which belongs to one of them alone.

Another element in education, namely the teaching of languages, has no less legitimately, ever since ancient times classified expressions into periods, propositions and words, and words into various species, and each species according to the variations and combinations of roots and suffixes, syllables and letters, and hence have arisen alphabets, grammars and vocabularies, just as in another way for poetry has arisen a science of prosody, and for music and the figurative and architectural arts there have arisen musical and pictorial grammars and so forth But here, too, the ancients did not succeed in avoiding an illegitimate transition *ab intellectu ad rem*, from abstractions to reality, from the empirical to the philosophical, such as we have already observed elsewhere; and this involved thinking of speech as an aggregation of words, and words as aggregations of syllables or of roots and suffixes; whereas the *prius* is speech itself, a continuum, resembling an organism, and words and syllables and roots are a *posterius*, an anatomical preparation, the product of the abstracting intellect, not the original or real fact. If grammar, like rhetoric in the case above considered, is transplanted into aesthetic, the result is a distinction between expression and the means of expression, which is a mere reduplication; for the means of expression are just expression itself, broken into pieces by grammarians This error, combined with the error of distinguishing between simple and ornate form, has prevented people from seeing that the philosophy of language is not a philosophic grammar, but is wholly devoid of grammatical elements It does not raise grammatical classifications to a philosophical level: it ignores them, and, when they get in its way, destroys them The philosophy of language, in a word, is identical with the philosophy of poetry and art, the science of intuition-expression, aesthetics, which embraces language in its whole extension, passing beyond the limits of phonetic and syllabic language, and in its unimpaired reality as living and completely significant expression

**Classical and Romantic.**—The problems reviewed above belong to the past—a past extending through centuries—rather than to the present; of their mis-stated questions and misconceived solutions there now remain mere relics and superstitions which affect academic treatises more than they do the consciousness and culture of ordinary people. But it is necessary to watch carefully for new shoots from the old stock, which still appear from time to time, in order to cut them down Such is, in our own time, the theory of styles applied to the history of art (Wolfflin and others) and extended to the history of poetry (Strick and others), a new irruption of rhetorical abstractions into the judgment and history of works of art. But the chief problem of our time, to be overcome by aesthetics, is connected with the crisis in art and in judgments upon art produced by the romantic period Not that this crisis was not foreshadowed by precedents and parallels in earlier history, like Alexandrian art and that of the late Roman period, and in modern times the Baroque art and poetry which followed upon that of the Renaissance The crisis of the romantic period, together with sources and characteristics peculiar to itself, had a magnitude all of its own. It asserted an antithesis between *naïve* and *sentimental* poetry, *classical* and *romantic* art, and thus denied the unity of art and asserted a duality of two fundamentally different arts, of which it took the side of the second, as that appropriate to the modern age, by upholding the primary importance in art of feeling, passion and fancy. In part this was a justifiable reaction against the rationalistic literature of classicism in the French manner, now satirical, now frivolous, weak in feeling and imagination and deficient in a deep poetic sense; but in part, *romanticism* was a rebellion not against *classicism* but against the classical as such: against the idea of the serenity and infinity of the artistic image, against catharsis and in favour of a turbid emotionalism that could not and would not undergo purification. This was very well understood by Goethe, the poet both of passion and of serenity, and therefore, because he was a poet, a classical poet; who opposed romantic poetry as "hospital poetry." Later, it was thought that the disease had run its course and that romanticism was a thing of the past; but though some of its contents and some of its forms were dead, its soul was not: its soul consisting in this tendency on the part of art towards

an immediate expression of passions and impressions Hence it changed its name but went on living and working. It called itself "realism," "verism," "symbolism," "artistic style," "impressionism," "sensualism," "imagism," "decadentism," and nowadays, in its extreme forms, "expressionism" and "futurism" The very conception of art is attacked by these doctrines, which tend to replace it by the conception of one or other kind of non-art; and the statement that they are fighting against art is confirmed by the hatred of the extremists of this movement for museums and libraries and all the art of the past—that is, for the idea of art which on the whole corresponds with art as it has been historically realized The connection of this movement, in its latest modern form, with industrialism and the psychology produced and fostered by industrialism is obvious What art is contrasted with is practical life as lived to-day; and art, for this movement, is not the expression of life and hence the transcending of life in the contemplation of the infinite and universal, but the cries and gesticulations and broken colours of life itself. The real poets and artists, on the other hand, rare at any time, naturally continue, nowadays as always, to work according to the old and only idea of what art is, expressing their feelings in harmonious forms; and the real connoisseurs (rarer, these also, than people think) continue to judge their work according to this same idea. In spite of this, the tendency to destroy the idea of art is a characteristic of our age; and this tendency is based on the *proton pseudos* which confuses mental or aesthetic expression with natural or practical expression—the expression which passes confusedly from sensation to sensation and is a mere effect of sensation, with the expression which art elaborates, as it builds, draws, colours or models, and which is its beautiful creation The problem for aesthetics to-day is the reassertion and defence of the classical as against romanticism: the synthetic, formal theoretical element which is the *proprium* of art, as against the affective element which it is the business of art to resolve into itself, but which to-day has turned against it and threatens to displace it. Against the inexhaustible fertility of creative mind, the gates of hell shall not prevail; but the hostility which endeavours to make them prevail is disturbing, even if only in an incidental manner, the artistic taste, the artistic life and consequently the intellectual and moral life of to-day.

**The Criticism and History of Art and Literature.**—Another group of questions raised in works on aesthetics, though not unsuitable to such works, properly belongs to logic and the theory of historical thought. These concern the aesthetic judgment and the history of poetry and the arts. By showing that the aesthetic activity (or art) is one of the forms of mind, a value, a category, or whatever we choose to call it, and not (as philosophers of various schools have thought) an empirical concept referable to certain orders of utilitarian or mixed facts, by establishing the *autonomy of aesthetic value,* aesthetics has also shown that it is the predicate of a special judgment, the *aesthetic judgment,* and the subject-matter of history, of a special history, the history of poetry and the arts, *artistic and literary history.*

The questions that have been raised concerning the aesthetic judgment and artistic and literary history are making allowance for the peculiar character of art, identical with the methodological questions that arise in every field of historical study. It has been asked whether the aesthetic judgment is *absolute* or *relative;* but every historical judgment (and the aesthetic judgment affirming the reality and quality of aesthetic facts is an historical judgment) is always both absolute and relative at once: absolute, in so far as the category involved in the construction possesses universal truth; relative, in so far as the object constructed by that category is historically conditioned: hence in the historical judgment the category is individualized and the individual becomes absolute. Those who in the past have denied the absoluteness of the aesthetic judgment (sensationalistic, hedonistic or utilitarian aestheticians) denied in effect the quality, reality and autonomy of art. It has been asked whether a knowledge of the history of the time—the whole history of the time in question—is necessary for the aesthetic judgment of the art of that time; it certainly is, because, as we know, poetic creation presupposes all the rest of the mind which it is converting into lyrical imagery, and the one aesthetic creation presupposes all the other creations (passions, feelings, customs, etc.) of the given historical moment. Hence may be seen the error both of those who advocate a merely historical judgment upon art (historical critics) and of those who advocate a merely aesthetic (aesthetic critics) The former would find in art all the rest of history (social conditions, biography of the artist, etc ), but would omit that part which is proper to art; the latter would judge the work of art in abstraction from history, depriving it of its real meaning and giving it an imaginary meaning or testing it by arbitrary standards. Lastly, there has appeared a kind of scepticism or pessimism as to the possibility of understanding the art of the past; a scepticism or pessimism which in that case ought to extend to every part of history (history of thought, politics, religion and morality), and refutes itself by a *reductio ad absurdum,* since what we call contemporary art and history really belong to the past as much as those of more distant ages, and must, like them, be re-created in the present, in the mind that feels them and the intellect that understands them. There are artistic works and periods that remain to us unintelligible; but this only means that we are not now in a position to enter again into their life and to understand them, and the same is true of the ideas and customs and actions of many peoples and ages. Humanity, like the individual, remembers some things and forgets many others; but it may yet, in the course of its mental development, reach a point where its memory of them revives.

A final question concerns the form proper to artistic and literary history, which, in the form that arose in the romantic period, and still prevails to-day, expounds the history of works of art as a function of the concepts and social needs of its various periods, regarding them as aesthetic expressions of these things and connecting them closely with civil history This tends to obscure and almost to render invisible the peculiar character of the individual work of art, the character which makes it impossible to confuse one work of art with any other, and results in treating them as documents of social life. In practice no doubt this method is tempered by what may be called the "individualizing" method, which emphasizes the individual character of the works; but the mixture has the defects of all eclecticism. To escape this, there is nothing to do but consistently to develop individualizing history, and to treat works of art not in relation to social history but as each a world in itself, into which from time to time the whole of history is concentrated, transfigured and imaginatively transcended in the individuality of the poetic work, which is a creation, not a reflection, a monument, not a document. Dante is not simply a document of the middle ages, nor Shakespeare of the English Renaissance; as such, they have many equals or superiors among bad poets and non-poets. It has been objected that this method imposed on artistic and literary history the form of a series of disconnected essays or monographs; but, obviously, the connection is provided by human history as a whole, of which the personalities of poets constitute a part, and a somewhat conspicuous part (Shakespearian poetry is an event no less important than the Reformation or the French Revolution), and, precisely because they are a part of it, they ought not to be submerged and lost in it, that is, in its other parts, but ought to retain their proper proportions and their original character

**History of Aesthetics.**—From the character of aesthetics as a philosophical science (*see* above) it follows that its history cannot be separated from that of philosophy at large, from which aesthetics receives light and guidance, and gives back light and guidance in its turn. The so-called subjectivist tendency which modern philosophy acquired with Descartes, for instance, by promoting enquiry into the creative power of the mind, indirectly promoted enquiry into the aesthetic power; and [illegible] an example of the influence of aesthetic on the rest [illegible], it is enough to recall the effect which the mature consciousness of creative imagination and poetic logic had in liberating philosophical logic from the traditional intellectualism and formalism, and raising it to the level of speculative or dialectical logic in

the philosophies of Schelling and Hegel. But if the history of aesthetics must be seen as a part of the entire history of philosophy, it must on the other hand be enlarged beyond its boundaries as ordinarily defined, which would restrict it almost entirely to the series of works by so-called professional philosophers and of the academic treatises known as "systems of philosophy." Genuine and original philosophical thought is often to be found, alive and energetic in books not written by professional philosophers and not outwardly systematic; ethical thought, in works of asceticism and religion; political, in the works of historians; aesthetic, in those of art-critics, and so forth. Further, it must be remembered that, strictly speaking, the subject-matter of the history of aesthetics is not the problem, the single problem, of the definition of art, a problem exhausted when that definition has been or shall have been attained; but the innumerable problems which are perpetually springing up in connection with art, in which this one problem, the problem of defining art, acquires particularity and concreteness, and in which alone it truly exists Subject to these warnings, which must be carefully borne in mind, a general sketch of the history of aesthetics may be given, to provide a preliminary orientation, without running the risk of being understood in an unduly rigid and simplificatory manner.

A sketch of this kind must accept, not merely as convenient for purposes of exposition but as historically true, the common statement that aesthetics is a modern science. Graeco-Roman antiquity did not speculate about art, or speculated very little; its chief concern was to create a method of artistic instruction, not a "philosophy" but an "empirical science" of art. Such are the ancient treatises on "grammar," "rhetoric," "institutions of oratory," "architecture," "music," "painting" and "sculpture"; the basis of all later methods of instruction, even those of to-day, in which the old principles are restated and interpreted *cum grano salis*, but not abandoned, because in practice they are indispensable. The philosophy of art did not find favourable or stimulating conditions in ancient philosophy, which was primarily "physics" and "metaphysics," and only secondarily and intermittently "psychology" or more precisely "philosophy of mind." To the philosophical problems of aesthetics it only referred in passing, either negatively, in Plato's denial of the value of poetry, or positively, in Aristotle's defence, which attempted to secure for poetry a realm of its own between that of history and that of philosophy, or again in the speculations of Plotinus, who for the first time united the previously disconnected concepts of "art" and "the beautiful." Other important thoughts of the ancients were that to poetry belonged "tales" (*μύθοι*) and not "arguments" (*λόγοι*), and that "semantic" (rhetorical or poetical) propositions were to be distinguished from "apophantic" (logical). Lately an almost wholly unexpected strain of ancient aesthetic thought has come to light, in the Epicurean doctrines expounded by Philodemus, in which imagination is conceived in what seems almost a romantic way. But these observations remained, for the time being, practically sterile; and the ancients' firm and sure judgment in artistic matters was never raised to the level and consistency of a theory, owing to an obstacle of a general nature—the objectivistic or naturalistic character of ancient philosophy, whose removal was only commenced, or demanded, by Christianity when it brought the problems of the soul into the focus of thought.

But even Christian philosophy, partly through its predominating transcendence, mysticism and asceticism, partly through the scholastic form which it borrowed from ancient philosophy and with which it remained content, while it raised the problems of morality in an acute form, and handled them with delicacy, did not penetrate deeply into the mental region of imagination and taste, just as it avoided the region which corresponds to it in the sphere of practice, the region of passions, interests, utility, politics and economics. Just as politics and economics were conceived moralistically, so art was subordinated to moral and religious allegory; and the germs of aesthetics scattered through the ancient writers were forgotten or only superficially remembered. The philosophy of the Renaissance, with its return to naturalism, revived, interpreted and adapted the ancient poetics and rhetorics and treatises on the arts; but though it laboured long at "verisimilitude" and "truth," "imitation" and "the idea," "beauty" and the mystical theory of beauty and love, "catharsis" or the purgation of passion, and the problems of the literary kinds, traditional and modern, it never reached a new and fruitful principle. No thinker arose capable of doing for the Renaissance treatises on poetry and art what Machiavelli did for political science, asserting with emphasis, not merely by the way and as an admission, its original and autonomous character.

Much more important in this respect, though its importance was long overlooked by historians, was the thought of the later Renaissance, known in Italy as the *seicento*, Baroque, or the literary and artistic decadence. This was the time at which the distinction was first insisted upon between the "intellect" and a faculty called *ingegno, ingenium*, "wit" or "genius," as especially inventive of art; and, corresponding to this, a faculty of judgment, which was not ratiocination or logical judgment, because it judged "without discourse" or "without concepts," and came to be called "taste." These terms were reinforced by another, which appeared to denote something not determinable in logical concepts and in some way mysterious: *"nescio quid"* or *"je ne sais quoi"*; an expression particularly frequent in Italy (*non so che*), and imitated in other countries. At the same time were sung the praises of the enchantress "imagination," of the "sensible" or "sensuous" element in poetic imagery, and of the miracles of "colour," in painting, as opposed to "drawing" which seemed not altogether free from an element of cold logic These new intellectual tendencies were somewhat turbid, but at times were purified and raised to the level of reasoned theory, *e g.*, Zuccolo (1623), who criticized "metric art" and replaced its criteria by the "judgment of sense," which to him meant not the eye or the ear but a higher power united to the senses; Mascardi (1636), who rejected the objective and rhetorical distinction between the styles, and reduced style to the particular individual manner arising out of the particular "wit" of each writer, thus asserting the existence of as many styles as there are writers; Pallavicino (1644), who criticized "verisimilitude" and assigned to poetry as its proper domain that of "first apprehensions" or imaginations, "neither true nor false"; and Tesauro (1654), who tried to work out a logic of rhetoric as opposed to the logic of dialectic, and extended the rhetorical forms beyond merely verbal form, to pictorial and plastic form.

Cartesianism, to which we have already referred, though, in the hands of Descartes and his successors, hostile to poetry and imagination, from another point of view, as stimulating enquiry into the subject or the mind, helped these scattered efforts (as we have said) to consolidate themselves into a system and to search for a principle to which the arts could be reduced; and here too the Italians, welcoming Descartes' method but not his rigid intellectualism or his contempt for poetry, art and imagination, wrote the first treatises on poetry in which the concept of imagination played a central or leading part (Calopreso 1691, Gravina 1692 and 1708, Muratori 1704 and others). These had considerable influence on Bodmer and the Swiss school, and, through them, on the new German criticism and aesthetics and that of Europe at large; so that a recent writer (Robertson) could speak of "the Italian origin of romantic aesthetics."

These minor theorists led to the work of G. B Vico, who in his *Scienza nuova* (1725–1730) propounded a "poetic logic" which he distinguished from "intellectual logic"; regarded poetry as a mode of consciousness or theoretic form preceding the philosophical or reasoning form, and asserted as its sole principle the imagination, which is strong in proportion as it is free from ratiocination, its enemy and destroyer; praised as father and prince of all true poets the barbaric Homer, and with him, though impaired by theological and scholastic culture, the half-barbaric Dante; and attempted, though without success, to discern English tragedy and Shakespeare, who, though undiscovered by Vico, would, had he known him, certainly have been his third barbaric and supreme poet. But in aesthetics as elsewhere, Vico in his lifetime founded no school, because he was before his time, and also because his philosophical thought was concealed

beneath a kind of historical symbolism. "Poetic logic" only began to make progress when it reappeared in a far less profound shape, but in a more favourable environment, in the works of Baumgarten, who systematized an aesthetics of a somewhat hybrid Leibnitzian origin, and gave it various names, including *ars analogi rationis, scientia cognitionis sensitivae, gnoseologia inferior,* and the name it has retained, *aesthetica* (*Meditationes,* 1735; *Aesthetica,* 1750–58).

The school of Baumgarten, or (more correctly) of Leibnitz, which both did and did not distinguish imaginative from logical form (for it regarded it as *cognitio confusa* and none the less ascribed to it a *perfectio* of its own), and the current of English aesthetics (Shaftesbury, Hutcheson, Hume, Home, Gerard, Burke, Alison, etc.), together with the essays on beauty and art which abounded at this time, and the theoretical and historical works of Lessing and Winckelmann, contributed to provide the stimulus, partly positive and partly negative, to the formation of the other masterpiece of 18th century aesthetics, the *Critique of Judgment* (1790) by Immanuel Kant, in which the author (after doubting it in the first *Critique*) discovered that beauty and art afford subject-matter for a special philosophical science—in other words, discovered the autonomy of the aesthetic activity. As against the utilitarians he showed that the beautiful pleases "without interest" (*i.e.*, utilitarian interest); against the intellectualists, that it pleases "without concepts", and further, against both, that it has "the form of purposiveness" without "representation of a purpose", and, against the hedonists, that it is "the object of a universal pleasure." In substance, Kant never went beyond this negative and generic assertion of the beautiful, just as, in the *Critique of Practical Reason,* once he had vindicated the moral law, he did not go beyond the generic form of duty. But the principles he had laid down were laid down once for all. After the *Critique of Judgment,* a return to hedonistic and utilitarian explanations of art and beauty could (and did) take place only through ignorance of Kant's demonstrations. Even the return to Leibnitz and Baumgarten's theory of art as confused or fanciful thinking would have been impossible, had Kant been able to link up his own theory of the beautiful, as pleasing apart from concepts, and as purposiveness without representation of purpose, with Vico's imperfect and inconsistent but powerful theory of the logic of imagination, which was to some extent represented in Germany at this time by Hamann and Herder. But Kant himself prepared the way for the reassertion of the "confused concept" when he ascribed to genius the virtue of combining intellect and fancy, and distinguished art from "pure beauty" by defining it as "adherent beauty."

This return to the tradition of Baumgarten is apparent in post-Kantian philosophy when it regards poetry and art as a form of the knowledge of the Absolute or the Idea, whether equal to philosophy, inferior and preparatory to it, or superior to it as in Schelling's philosophy (1800) where it becomes the organ of the Absolute. In the richest and most striking work of this school, the *Lectures on Aesthetic* of Hegel (1770–1831), art, with religion and philosophy, is placed in the "sphere of the absolute mind," where the mind is set free from empirical knowledge and practical action, and enjoys the beatific thought of God or the Idea. It remains doubtful whether the first moment in this triad is art or religion; different expositions of his doctrine by Hegel himself differ in this respect; but it is clear that both, art and religion alike, are at once transcended and included in the final synthesis which is philosophy. This means that art, like religion, is substantially an inferior or imperfect philosophy, a philosophy expressed in imagery, a contradiction between a content and a form inadequate to it which only philosophy can resolve. Hegel, who tended to identify the system of philosophy, the dialectic of concepts, with actual history, expressed this by his famous paradox of the death of art in the modern world, as incapable of subserving the highest interests of the age.

This conception of art as philosophy, or intuitive philosophy, or a symbol of philosophy, or the like, reappears throughout the idealistic aesthetics of the first half of the 19th century, with rare exceptions, *e.g.*, Schleiermacher's *Lectures on Aesthetic* (1825, 1832–33) which we possess in a very incomplete form. In spite of the high merit of these works, and the enthusiasm for poetry and art which they express, the reaction against this type of aesthetics was, at bottom, a reaction against the artificial character of the principle on which they were based. This reaction took place in the second half of the century, simultaneously with the general reaction against the idealistic philosophy of the great post-Kantian systems. This anti-philosophical movement certainly had its significance as a symptom of discontent and of a desire to find new paths, but it did not produce an aesthetics correcting the errors of its predecessors and carrying the problem a stage further. In part, it was a breach in the continuity of thought; in part, a hopeless attempt to solve the problems of aesthetics, which are philosophical problems, by the methods of empirical science (*e.g.*, Fechner); in part, a revival of hedonistic and utilitarian aesthetic by a utilitarianism resting on association of ideas, evolution and a biological theory of heredity (*e.g.*, Spencer). Nothing of real value was added by the *epigoni* of idealism (Vischer, Schasler, Carriere, Lotze, etc.), or the followers of the other early 19th century philosophical movements, *e.g.*, the so-called formalistic aesthetics (Zimmermann) derived from Herbart, or the eclectics and neo-Kantists, who, like all the rest, laboured at two abstractions, "content" and "form" ("aesthetics of content" and "aesthetics of form"), and sometimes tried to fasten the two together, failing to see that by so doing they were only uniting two fictions into a third. The best thoughts on art in this period are to be found not in the professional philosophers or aestheticians but in the critics of poetry and art, *e.g.*, De Sanctis in Italy, Baudelaire and Flaubert in France, Pater in England, Hanslick and Fiedler in Germany, Julius Lange in Holland, etc. These writers alone make amends for the aesthetic trivialities of the positivistic philosophers and the empty artificiality of the so-called idealists.

The general revival of speculative thought led to greater successes in aesthetics in the first decades of the 20th century. Especially noteworthy is the union which is taking place between aesthetics and the philosophy of language, facilitated by the difficulties under which linguistic, conceived as the naturalistic and positivistic science of the phonetic laws of language and similar abstractions, is labouring. But the most recent aesthetic productions, because they are recent and still in process of development, cannot as yet be historically placed and judged.

BIBLIOGRAPHY.—The chief monuments of aesthetic thought have already been referred to in the foregoing outline. It may be added that the latest revision of the text of Aristotle's *Poetics,* together with a commentary, is that of A. Rostagni (Turin, 1927), and that the fragments of the Epicurean Philodemus (polemic against Neoptolemus of Parium) have been edited by Jensen (*Philodemos uber die Gedichte Funftes Buch,* Berlin, 1923). Of Vico's second *Scienza nuova* the complete critical edition is that of F. Nicolini (Bari, 1911–16). Of Baumgarten, there is a reprint of the *Meditationes philosophicae de nonnullis ad poema pertinentibus* (1735), edited by Croce, Naples, 1900, but the *Aesthetica,* a very rare book, has unfortunately not been reprinted, though a previously unpublished course of Baumgarten's lectures on aesthetics has been published by B. Poppe (*A. G. Baumgarten·* Berne-Leipzig, 1907). Of Hegel's *Vorlesungen uber die Aesthetik,* which we possess in Hotho's redaction (ed. 2, Berlin, 1842–43).

For the history of aesthetics, R. Zimmermann, *Geschichte der Aesthetik als philosophischer Wissenschaft* (Wien, 1858), and M. Schasler, *Kritische Geschichte der Aesthetik* (Berlin, 1872), may be consulted, though their standards of judgment are now out of date. *See* also B. Bosanquet, *A History of Aesthetic* (London, 1892). A history of aesthetics is contained in the second part of B. Croce's *Estetica come scienza dell' expressione e linguistica generale* (Bari, 1902; ed. 5, 1922; Eng. trans., abridged, London, 1915; 2nd ed., complete, 1922), and an essay completing and correcting this work, entitled *Inizio, periodi e caratteri* [illegible], in the same author's *Nuovi saggi di Estetica* (ed. 2, Bari, 1926), which contains the most mature form of the writer's theoretical and historical thought on the subject. For ancient aesthetics Ed. Müller, *Geschichte der Theorie der Kunst bei den Alten* (Breslau, 1831–37), is still very useful; among recent works, E. Panovski, *Idea* (Leipzig, 1924), and A. Rostagni, "Per un' estetica dell' intuizione presso gli antichi" (in *Atene e Roma,* a review of classical philology, Florence, 1920); *Aristotele e l'aristotelismo nella storia dell' Estetica antica* (Florence 1921). For mediaeval aesthetics the best work is contained in books on Dante, *e.g.*, Vossler's; *cf.* also Comparetti, *Virgilio nel medio evo* (ed. 2, Florence, 1896) vol. i. For Renaissance aesthetics, J. E. Spingarn, *A History of Literary Criticism in the Renaissance* (New York, 1899); K. Borinski, *Die Poetik der Renaissance und die Anfänge der literarischen Kritik in Deutschland* (Berlin, 1896). For the Italian *seicento,* Croce, *Storia, cit.,* and essays in *Problemi di Estetica* (ed. 2, Bari, 1923) and *Storia dell' età barocca in Italia* (Bari, 1928); J. M. Robertson, *Studies in the Genesis of Romantic Theory* (London, 1923), H. Quigley, *Italy and the Rise of a New School of Criticism in the 18th Century* (Glasgow, 1921). For Vico's aesthetics, B. Croce, *La filosofia di G. B. Vico* (ed. 2, Bari, 1922; Eng. trans. London, 1913). For German 18th century aesthetics, R. Sommer, *Grundzüge einer Geschichte der deutschen Psychologie und Aesthetik von Wolff-Baumgarten bis Kant-Schiller* (Würzburg, 1892). For the origin of Kant's aesthetics, O. Schlappe, *Kants Lehre vom Genie und die Entstehung der Kritik der Urtheilskraft* (Göttingen, 1901). For that of Schiller, V. Basch, *La poétique de Schiller* (ed. 2, Paris, 1911). For the Hegelian aesthetics the old but penetrating study of Th. W. Danzel, *Über die Aesthetik des hegelschen Philosophie* (Hamburg, 1844), must not be forgotten. For English aesthetics, A. E. Powell (Mrs. Dodds), *The Romantic Theory of Poetry* (London, 1926). For the reaction of idealism, E. v. Hartmann (who was one of them), *Die deutsche Aesthetik seit Kant* (Berlin, 1886). For recent aesthetics, H. Wildon Carr, *The Philosophy of B. Croce: The Problem of Art and History* (1917); E. F. Carritt, *The Theory of Beauty* (ed. 2, London, 1923); R. G. Collingwood, *Outlines of a Philosophy of Art* (1925). For the history of the philosophy of language in the idealistic period (Hamann, Herder, Humboldt) cf. H. Steinthal, *Ursprung der Sprache* (ed. 4, Berlin, 1888); *Geschichte der Sprachwissenschaft bei den Griechen und Römern* (ed. 2, Berlin, 1890–1891). For recent philosophy of language as aesthetics, Croce, *opp. cit.*, and Vossler, Spitzer, Lerch, Bertoni, Bartoli, etc. (B. CR.)

**AESTHETICS, EXPERIMENTAL.** Great artists throughout the centuries have contributed to an empirical aesthetic in the broad sense of the term. Some of them have given us extensive treatises based upon an analysis of their own methods of artistic production, or upon an investigation of existing works of art. Hogarth, for example, examined many forms of architecture, as well as the lines of the human figure, in a search for a norm of beauty which he thought he had found in the serpentine line, and Goethe in his *Farbenlehre* has made keen observations in regard to the aesthetics of colour. From the long list of names might also be mentioned Leonardo da Vinci, Sir Joshua Reynolds and M. E. Chevreul. G. Th. Fechner, however, is generally considered the founder of experimental aesthetics. He not only discussed the formal, or direct, and the associative factors underlying beauty on the basis of his experience of works of art, but he devised experiments in order to settle scientifically the question of the most pleasing proportions in geometrical forms and in line division. This problem had engaged the attention of a number of writers, whose results are in strong disagreement. Wolff insisted upon the proportion of 1:1, while Adolf Zeising thought the proportion of the golden section (1:1·618) to be the most pleasing, on the principle that it gives the greatest possible diversity in a harmonious unity. It was the proportion of the golden section that Fechner desired to put to experimental proof. He spread figures of different sizes, such as ellipses, before the observer, with instructions to choose the one which seemed the most pleasing, or he had the person construct a figure according to the most pleasing proportion. It was these two methods of choice and construction, together with that of use, which he proposed as the proper empirical methods of investigation, and these methods have continued to be employed up to the present day. Fechner found the golden section to hold in many instances, but he also found the proportions of 1:1 and 1:3 to be pleasing under certain circumstances. Lightner Witmer thought that Fechner used too few figures, and that the experiments were not properly controlled. He therefore used a serial order of figures with the least perceptible difference of proportion between them. He also had the figures compared in pairs. His results do not always agree with those of Fechner, but he established the importance of the golden section for rectangles, ellipses and line division. An interesting fact came to light in experiments conducted by R. P. Angier. His subjects divided a line at what seemed to them the most pleasing point. Although several persons came near the golden section, no one actually chose it. Nevertheless, the average of all observers was almost exactly the golden section. His results served as a warning not to place too much weight upon averages in the search for an aesthetic norm. In general, however, it may be said that the golden section and symmetry are pleasing, that a division very near the middle and one which makes the shorter line less than a quarter of the length of the whole line are displeasing.

Numerous experiments have been made upon form and balance, with the principal aim of obtaining a psychological explanation of the pleasing effects. T. H. Haines and A. E. Davies, from their work with a series of cards having a constant length and varying width, decided that eye-movements, associations, balance between forces of attention, and suggestion, were the factors which determined the aesthetic effect. Ethel D. Puffer made an extensive study of balance by the use, among other objects, of lines of various sizes and in various positions. She found that the best aesthetic balance generally corresponded to the mechanical balance, and explained the results in terms of interest which, in the last analysis, meant for her a balance of motor impulses. L. J. Martin asserted that our preference for lines and shapes depends very much upon our attitude toward the objects we are judging. A slanting line, when interpreted as a bad vertical, is displeasing, but when we think of it as a horizontal line which is raising itself to a vertical, it is pleasing. F. Sander believes that absence of feelings of tension produces a restful effect such as is experienced in viewing Greek architecture, while vivid tensions underlie our reactions to Romanesque and Gothic architecture.

The theory of empathy made famous by Th. Lipps has also been offered frequently as an explanation of the aesthetic feelings aroused by lines, forms and other properties of art objects. A modern psychological interpretation of this theory is that the individual imitates in terms of his own reactions the patterns suggested by the art object. These reactions are projected by the individual into the external object and are perceived not as his own but as the dynamic qualities of the object. Experiments furnish some support for this theory of empathy in that implicit or nascent muscular activity related to the stimulus-situation has been detected during the act of perception.

The empathic value of lines in expressing emotional moods has been demonstrated in experiments in which subjects have been asked to draw lines to express emotional states and qualities or in which they have been asked to match various types of lines with descriptive adjectives. The agreement concerning the expressiveness of lines is much greater than chance expectation. For example, moods with little motor expression such as sadness and quietness are represented in the drawings by wide sweeping curves whereas moods of excitement are represented by sharp curves and acute angles. Investigations of the ability of children to approximate adult judgment in this field show that even kindergarten pupils do better than chance, that there is a positive correlation between this ability and age and that artistic children do better than non-artistic children. The early recognition of the expressive qualities of pure lines argues against an association explanation and suggests an empathic basis in the type of bodily response occurring in a given emotional condition.

The modern trend, however, is to emphasize the relationship of the line to the form of which it is a part, or the relationship of the figure to the total pattern in which it appears. As early as 1903 Legowski concluded from his experiments on judgments for the same type of figures of varying proportions that the sensibility of the relationships was the cause of their pleasantness. More recently Birkhoff has studied form preference and used as a measure of aesthetic pleasure the relation between order and complexity. The elaborations of his basic formula, $M = \frac{O}{C}$ ($M$ = aesthetic measure, $O$ = order and $C$ = complexity) are not as objective as their mathematical expression might suggest, but Birkhoff's results do indicate that the degree of pleasure is related to ability to resolve complex relationships into a unified pattern—a very old aesthetic doctrine.

**Colour.**—Goethe in his *Farbenlehre* discussed the moods aroused by colours, and the different psychological effects of different colour combinations. Chevreul studied colours from the aesthetic standpoint, and remarked that complementary colours form the most pleasing combinations, as there is a harmony in the contrast, and half a century later Bezold stated that the colours which are very nearly, but not quite, complementary form the best combinations. Towards the end of the last century, Jonas Cohn and August Kirschmann performed controlled experiments on colour in the manner advocated by Fechner. Both men found contrast to be pleasing, and Cohn's results led him to conclude that saturated colours are in most instances preferred. From about this time the number of treatises on colour preferences began to grow rapidly, and the papers have covered a large field of investigation. The effects of hue, saturation and brightness, together with such factors underlying preference as the time of exposure of the colours, suggestion and association, have been studied. A large number of treatises deal with the colour preferences of infants and school children, and the changes in colour preference which occur with age. Comparative studies have also been made of the colour preferences of the sexes and of races. The experiments were done under such widely different conditions that in many cases they are hardly comparable, and the results are so numerous and varied that they are difficult to summarize. In no instance was there any great agreement in regard to the preference either for single colours or for combinations, and often there was not even a great constancy in the choice of the individual observer. All that one can indicate are general tendencies. Red and blue seem to be the favourite colours, and orange and yellow usually rank low. It appears from the mass of information that has been collected that men have the strongest preference for blue and women for red. A typical order of preference is blue, red, purple, green, orange, yellow, which would mean that the colours at the ends of the spectrum have the best chance of being chosen as the most pleasing. Also, saturated colours have a strong attraction, but are not always preferred. As Titchener has remarked, there seem to be two types of observers, one of which prefers saturated colours, the other definitely prefers unsaturated or what are popularly called artistic colours. E. Bullough has made an analysis of the psychological attitude of persons toward colours, and has found that there are four main types of judgments: the objective, where the peculiarities of the colours such as clarity are observed; the physiological, where the aspects of warmth, hardness, etc., are noted; the associative, where the colours remind the observer of some experience; and the character judgment, where the colours are expressive of mood. It seems, then, that our preference depends very much upon our attitude. Indeed, as von Allesch has stated, the old talk of beauty and ugliness of colours has only relative meaning. All colours can be all things at the right moment and at the right place. Nevertheless, we may say that in general complementary colours seem to be pleasing in combination, and probably also those colours which are nearly complementary. On the other hand, colours which are neighbouring in the spectrum do not seem to go together. Harmony, however, can generally be obtained from the inharmonious combination of two colours by the proper selection of a third colour to form a triad.

**Sound.**—The most important work on the psychology of music is that of Carl Stumpf. His book *Tonpsychologie* (1890) is a classic in this field and contains, among many theories and facts of importance, his psychological theory of consonance, which is based upon an empirical study of the perception of tonal combinations. For Stumpf, degree of consonance is correlated with degree of fusion of

the two tones of a musical interval In his subsequent writings, he has vigorously attacked the physical theory of consonance of Herman v. Helmholtz and F. E. Kruger. Stumpf has also done extensive work upon the tonal quality of vowels and consonants One of his latest investigations in the auditory field is a comparison of singing and talking, which he finds not fundamentally different In speaking we use for the most part a continuous change in tone, while in singing we use discrete tonal steps. H T. Moore has shown experimentally that, up to a certain point, the pleasantness of tonal intervals grows with our experience of them, which accounts for the gradual change in our attitude toward consonance and dissonance. O. Abraham and E. M. von Hornbostel, in their analysis of tonal intervals, have discovered two factors underlying the experience, one a qualitative the other a quantitative, which they call distance or width and accord quality, respectively. C E. Seashore has devised a series of tests which can be given by means of phonograph records In his latest work he describes the results obtained by photographing the vibrations of the singing voice. He has detected the vibrato, or synchronous oscillations of pitch and rate of five to eight per second in artistic singing.

In experiments upon the appreciation of pictures the introspective method has usually been employed. O. Kulpe showed pictures for three seconds each to a number of persons, and recorded their reports. He did not find evidence of empathy to support Lipps's theory. On the other hand, muscular sensations in a form which, according to Karl Groos, is called inner mimicry are present at times, but not always. A unique method of investigating the effect of pictures upon children was used by R. Schultze who photographed the children while they were looking at the pictures One was then able to judge from the photographs which picture the child had been looking at, as well as the mood which had been aroused.

A laboratory research in the field of literature which is suggestive, both from the point of view of method and content, is that of R. C. Givler. He showed conclusively the importance of the mere sound of words in conveying the meaning as well as the moods of poetry. Most of the investigations of the aesthetics and psychology of prose and poetry, however, have been in the nature of a direct analysis of the works themselves, or a study of the life of the artist, and do not come under experimental aesthetics in the narrow sense of that term, as used in this article. J. L. Lowes' *The Road to Xanadu* (1927) might, however, be mentioned as a model piece of research of this nature. Comparing the contents of a note-book left by Coleridge with the text of *The Rhyme of the Ancient Mariner* and *Kubla Khan,* Lowes has been able to analyse most convincingly the subconscious mind of that poet. Freud and his followers have also made numerous analyses of the subconscious minds of artists. Their results will undoubtedly be of interest to those persons who believe in the psychoanalytic method, and even the sceptic will find some suggestive material in their writings.

A promising modern development in experimental aesthetics is the genetic investigation of artistic creation and appreciation. The fundamentals of preference for form and pattern are well on their way toward assimilation by the time children enter grade school. Children between the ages of two and five years prefer balance in tri-dimensional designs to imbalance. Controlled observation confirms the popular belief in the sensitivity of young children to rhythm in music Graphic rhythm (regular repetition in two-dimensional form) is preferred in pictorial presentation by five-year olds Children of this age ever show an appreciation of rhythm in abstract design. One study of talented children, aged five to seven years, definitely established the presence of creative artistic imagination at this age level The pictures painted by the children were not generalized depictions of simple objects or stereotyped forms but were of a compositional character. Moreover, these talented novices showed a critical attitude toward their work characteristic of the professional. They were seldom satisfied with their first efforts and usually expressed in specific terms a critical evaluation of each stage of the production as they went along.

An interesting problem in the psychology of art is the relationship among the various fields of artistic expression (music, painting, etc. Critics with a classical bias have affirmed the uniqueness of each of the arts, whereas artists of a less conservative bent have sometimes assumed a common basis and a common method of appeal to all the arts. An extreme example is the colour organ which attempts to use the temporal presentation of music in the visual field. The writings of Gertrude Stein and the paintings of some surrealists are likewise attempts to cut across the conventional bounds of the art fields in the belief in the unity of all psychological experience. The problem has been approached experimentally by comparing the moods aroused by painting with those aroused by music and by comparing the qualities of the various sensory modalities. J. Cowles presented 33 subjects with seven pictures as they listened to seven successive musical selections. They were asked to specify the picture which best suited each musical selection. A fairly high degree of agreement was found in the pairing of the visual and the auditory stimuli. Pictures suggestive of activity were nearly always paired with musical selections of prominent dynamic changes. That similar moods can be established in the individual through appeals to the different senses does not mean, however, that sensory qualities of the various sensory modalities have even a rough equivalence The eye and the ear as well as the other sense complexes give rise to distinctive qualities and even the intensive [illegible] these qualities are not strictly comparable. Moreover, Karwoski and Odbert in a study of colour music have challenged the absolute nature of coloured hearing (that form of synaesthesia in which people experience a definite and a constant colour sensation when a certain tone is sounded). They found no constant relationship between tone and colour which held for all subjects and even the individual subject showed considerable variability in his visual response The photism reported depended upon the total stimulus-situation and upon the familiarity with the musical selection as well as upon the tones themselves Experimental psychology corroborates those critics who would keep apart the various arts in their objective techniques though not necessarily in their appeal to affective experience.

BIBLIOGRAPHY.—For a history of experimental aesthetics up to 1899 the reader is referred to J. Larguier des Bancels's article "Les Méthodes de l'esthétique expérimentale" in *L'Année Psychologique* vi., pp. 144–190 (1899). [illegible]'s little work, *An Introduction to the Experimental Psychology of Beauty* (1913), describes a few typical experiments upon colour, form, balance and symmetry, and the [illegible] contemplation of pictures. C. S. Myers's *Text-book of Experimental Psychology,* pt. 1, ch. xxiv. (1922), deals primarily with the methods employed in experimental aesthetics. For a general treatment of psychological aesthetics *see* W. Wundt, *Physiologische Psychologie,* iii., pp. 123–209 (5th ed., Leipzig, 1902). For a summary of the work on aesthetics of colour *see* [illegible], *An Introduction to the Study of Colour Vision* (1924), and M. Luckiesh, *The Language of Colour* (1920) For a history of the problem of tonal intervals *see* M. Guernsey, "The Rôle of Consonance and Dissonance in Music," *Amer. J. Psychol.,* xl, pp. 173–204 (1928). The articles of Carl E. Seashore and his pupils upon the experimental psychology of music are to be found in the Iowa Studies in Psychology, *Psychol. Rev. Monog. Supl.,* Nos. 69, 108, 140, 167, 168; C. E. Seashore, *Psychology of Music* (1938). A comprehensive summary of the experimental work in music can be found in C. M. Diserens and H. Fine, *A Psychology of Music* (1939). For the psychology of rhythm *see* C. M. Ruckmick, "A Bibliography of Rhythm," *Amer. J. (H. S. L.; D. KA.)

**AESTIVATION,** literally "summer residence," a term used in zoology for the condition of torpor into which certain animals pass during the hottest season in hot and dry countries, contrasted with the similar winter condition, hibernation. In botany the word is used of the folded arrangement of the petals in a flower before expansion in the summer, contrasted with "vernation" of leaves which unfold in the spring. *See* HIBERNATION.

**AETA,** a Negrito tribe of the Philippine islands, woolly-haired, dark-skinned, dwarfish (the male stature is about 4ft. 9in.) inhabiting the mountainous districts of the larger islands and some of the smaller. They are characterized by a large and clumsy foot with abnormally divergent great toe. The social unit is the family; polygamy is permitted, but monogamy prevails. The dead are normally buried, but the bodies of those whom it is wished to honour are exposed on platforms or in trees. Bows and poisoned arrows are used, long spears and darts barbed with flint or shell. Fire is made by means of a flexible thong pulled to and fro in a notch in a cleft stick. They pray to a great serpent to show them yams and honey.

The Aeta were long recognized as the owners of the soil in spite of the arrival of Malayan settlers, and in Luzon they levied taxes upon the Tagalog and other tribes (until these arrived in such numbers as to push them back into the hills) taking the heads of defaulters. For much longer, perhaps even yet, they kept a debit and credit account of heads with the Igorots and other neighbours.

(J. H. H.)

**AETHELBALD,** king of Mercia, succeeded Ceolred, A.D. 716, at the beginning of the period of Mercian supremacy. His activities as a warrior were slight; in 733 he raided Somerset as far as Somerton, and led unimportant campaigns against the Northumbrians and the Welsh. In 752 Cuthred of Wessex led a successful raid into Oxfordshire against him. Aethelbald encouraged the development of the church, making large grants of land, and publishing a decree in 749 which freed ecclesiastical lands from all obligations to the king except the *trinoda necessitas.*

*See* Bede, *Hist. Ecc.* (ed. Plummer), v. 23 and Continuatio *s.a.* 740, 750, 757; *Saxon Chronicle* (Earle and Plummer), *s.a.* 716, 733, 737.

740, 741, 743, 755; Mabillon, *Acta Sanctorum*, ii pp. 264, 275–276, 279, 283–284; P. Jaffé, *Monumenta Moguntiaca*, iii. pp 168–177, W. de G. Birch, *Cartul. Saxon.*, 178 (1885–93).

**AETHELBALD,** king of Wessex, was the son of Aethelwulf, with whom he led the West Saxons to victory against the Danes at Aclea, 851. According to Asser he rebelled against his father on the latter's return from Rome in 856, and deprived him of Wessex, which he ruled until his death in 860. On his father's death in 858 he married his widow, Judith.

*See* Asser, *Life of Alfred* (W. H. Stevenson, 1904), 12; *Saxon Chronicle, s.a.* 851, 855, 860.

**AETHELBERT,** king of Kent, son of Eormenric, came to the throne in A.D. 560. Aethelbert's supremacy, described by Bede as extending in 597 to the Humber, can have been little more than nominal, though he exercised stricter sway over Essex, where his nephew, Sabert, was king. An attempt to extend his kingdom westwards was defeated in 568 by Ceawlin at Wibbandune. Aethelbert's reign is chiefly remarkable for the introduction of Christianity. He married a Christian princess, Berta, daughter of Charibert, king of Paris, who brought over a bishop as private confessor. When in 597 Augustine landed in Thanet, the king treated his mission tolerantly, gave him a dwelling in Canterbury and allowed monks to preach there, afterwards being baptized himself, but making no attempt to force conversion on his subjects. In 604 he founded the see of Rochester, and his influence established Mellitus at London in the same year. He published a code of laws, the first of its kind, containing a list of money fines for various offences against the clergy.

BIBLIOGRAPHY.—*See* Stubbs, *Dict. of Christian Biog. Ethelbert;* Bede, *Hist. Ecc.* (Plummer i. 25, 26, ii. 3, 5); *Saxon Chronicle* (Earle and Plummer), *s.a.* 568.

**AETHELBERT,** king of the West Saxons, succeeded to the under-kingdom of Kent during the lifetime of his father, Aethelwulf, and retained it until the death of his elder brother, Aethelbald, in 860, when he became sole king of Wessex and Kent till his death in 865. His reign was marked by two serious attacks by the Danes, who were repelled in 860 by the levies of Hampshire and Berkshire, though not before they had sacked Winchester, while in 865 they ravaged Kent after agreeing to take money for peace. Aethelbert was buried at Sherborne.

BIBLIOGRAPHY.—*See* the *Saxon Chronicle* (Earle and Plummer), *s.a.* 860, 865; *King Alfred's Will;* W. de G. Birch, *Cartul. Saxon.*, 553.

**AETHELFLAED** or **ETHELFLEDA,** the "Lady of the Mercians," the eldest child of Alfred the Great, was married about 886 to Aethelred, earl of Mercia, to whom Alfred entrusted the control of Mercia. On the accession of her brother Edward, Aethelflaed and her husband continued to hold Mercia. In 907 they fortified Chester, and in 909 and 910 either Aethelflaed or her husband must have led the Mercian host at the battles of Tettenhall and Wednesfield (or Tettenhall-Wednesfield, if these battles are one and the same). It was probably about this time that Aethelred fell ill, and the Norwegians and Danes from Ireland unsuccessfully besieged Chester. Aethelflaed won the support of the Danes against the Norwegians, and seems also to have entered into an alliance with the Scots and the Welsh against the pagans.

In 911 Aethelred died, and Edward took over Middlesex and Oxfordshire. Except for this, Aethelflaed's authority remained unimpaired. In 912 she fortified "Scergeat" and Bridgnorth, Tamworth and Stafford in 913, Eddisbury and Warwick in 914, Cherbury, "Weardbyrig" and Runcorn in 915. In 916 she sent an expedition against the Welsh, which advanced as far as Brecknock. In 917 Derby was captured from the Danes, and the next year Leicester and York both submitted to her. She died in 918 at Tamworth (June 12), and was buried in St. Peter's Church at Gloucester. This noble queen, whose career was as distinguished as that of her father and brother, left one daughter, Aelfwyn. For some 18 months Aelfwyn seems to have wielded her mother's authority, and then, just before the Christmas of 919, Edward took Mercia into his own hands, and Aelfwyn was "led away" into Wessex. Aethelflaed and her husband wielded almost kingly authority; the royal title is often given them by the chroniclers.

See *The Saxon Chronicle, s.a.* (especially the Mercian register in MSS. B, C and D); Florence of Worcester; *Fragments of Irish Annals* (ed. O'Conor), pp. 227–237, D.N.B., *s.v.* (A. M.)

**AETHELFRITH,** king of Northumbria, is said to have come to the throne in A.D. 593, being the son of Aethelric (probably reigned 568–72) He married Acha, daughter of Ella (Aelle), king of Deira, whom he succeeded, probably in 605, expelling his son Edwin. In 603 he repelled the attack of Aidan, king of the Dalriad Scots, at Daegsastan, defeating him with great loss. Later in his reign, probably in 614, he defeated the Welsh in a great battle at Chester, and massacred the monks at Bangor who were assembled to aid them by their prayers. This war had a strategic importance in the separation of the North Welsh from the Strathclyde Britons In 617 Aethelfrith was defeated and slain at the river Idle by Raedwald of East Anglia, whom Edwin had persuaded to take up his cause.

*See* Bede, *Chronica Maiora*, §531; *Hist. Ecc.* (Plummer) i. 34, ii. 2; *Saxon Chronicle, s.a.* 593, 603, 605, 616; *Hist. Brittonum*, §§57, 63; *Annales Cambriae, s.a.* 613.

**AETHELING,** an Anglo-Saxon word meaning originally "of noble descent," but soon restricted to members of a royal family, and in the *Anglo-Saxon Chronicle* used almost exclusively for members of the royal house of Wessex. It was occasionally used after the Norman Conquest to designate members of the royal family. In the 10th century, the *wergild* of an aetheling was equal to that of an archbishop and one-half of that of a king.

**AETHELNOTH** (d. 1038), archbishop of Canterbury, known also as EGELNODUS or EDNODUS, was a son of the ealdorman Aethelmaer, and a member of the royal family of Wessex. He became a monk at Glastonbury, then dean of the monastery of Christ Church, Canterbury, and chaplain to King Canute, and on Nov. 13, 1020, he was consecrated archbishop of Canterbury. He appears to have exercised considerable influence over Canute, largely by whose aid he restored his cathedral at Canterbury. Aethelnoth, who was called the "Good," died on Oct. 29, 1038.

**AETHELRED,** king of Mercia, succeeded his brother Wulfhere in A.D. 675. In 676 he ravaged Kent, destroying the monasteries and churches and taking Rochester. Aethelred married Osthryth, the sister of Egfrith, king of Northumbria, but a quarrel arose between the two kings, presumably over the possession of the province of Lindsey, which Egfrith had won back at the close of the reign of Wulfhere. In a battle on the banks of the Trent in 679, the king of Mercia was victorious and regained the province. Aelfwine, the brother of Egfrith, was slain, but at the intervention of Theodore, archbishop of Canterbury, Aethelred agreed to pay a wergild for the Northumbrian prince and so prevented further hostilities. Osthryth was murdered in 697 and Aethelred abdicated in 704, choosing Coenred as his successor. He then became abbot of Bardney, and, according to Eddius, recommended Wilfrid to Coenred on his return from Rome. Aethelred died at Bardney in 716. *See* WILFRID.

BIBLIOGRAPHY.—Eddius, *Vita Wilfridi* (Raine), 23, 40, 43, 45–48, 57; Bede, *Hist. Ecc.* (ed. Plummer), iii. 11, iv. 12, 21; *Saxon Chronicle, s.a.* 676, 679, 704, 716. (F. G. M. B.)

**AETHELRED I.,** king of Wessex and Kent (866–871), was the fourth son of Aethelwulf of Wessex, and should, by his father's will, have succeeded to Wessex on the death of his eldest brother Aethelbald. He seems, however, to have stood aside in favour of his brother Aethelbert, king of Kent, to whose joint kingdoms he succeeded in 866. Aethelred's reign was one long struggle against the Danes. In the year of his succession a large Danish force landed in East Anglia, and in the year 868 Aethelred and his brother Alfred went to help Burgred, or Burhred, of Mercia, against this host, but the Mercians soon made peace with their foes. In 871 the Danes encamped at Reading, where they defeated Aethelred and his brother, but later in the year the English won a great victory at "Aescesdun." A fortnight later they were defeated at Basing, but partially retrieved their fortune by a victory at "Maeretun" (perhaps Marden, in Wiltshire), though the Danes held the field. In the Easter of this year Aethelred died, perhaps of wounds received in the wars against the Danes, and was buried at Wimborne.

**II.** or **ETHELRED** (*c.* 968–1016), king of the English (surnamed THE UNREADY; *i.e.*, without *rede* or counsel), son of King Edgar by his second wife, Aelfthryth, was born in 968 or 969 and succeeded to the throne on the murder of his half-brother Edward (the Martyr) in 978. In the year after his accession the Danish invasions recommenced, though as yet their object was plunder only, not conquest. For an account of the repeated invasions, which gathered strength as time went on, *see* ENGLISH HISTORY. Aethelred's policy of buying off the raiders failed, and the massacre of Danes in England carried out by his orders on St. Brice's Day (Dec. 2, 1001) only made matters worse. Next year Sweyn returned, his hostility fanned by the desire for revenge. For two years he ravaged and slew; in 1003 Exeter was destroyed; Norwich and Thetford were sacked in 1004. No effectual resistance was offered, despite efforts here and there; disorganization of the country was complete In 1005 the Danes were absent in Denmark, but they came back next year, and emboldened by the utter lack of resistance, they ranged far inland. In 1007 Aethelred bought them off for a larger sum than ever (£36,000), and for two years the land enjoyed peace. In 1009, however, in accordance with a resolution made by the witan in the preceding year, Aethelred collected such a fleet "as never before had been in England in any king's day"; but owing to a miserable court quarrel the effort came to nothing. The king then summoned a general levy of the nation, with no better result. Just as he was about to attack, the traitor Edric prevented him from doing so, and the opportunity was lost. In 1010 the Danes returned, to find the kingdom more utterly disorganized than ever. "There was not a chief man in the kingdom who could gather a force, but each fled as he best might; nor even at last would any there resist another." Incapable of offering resistance, the king again offered money, this time no less than £48,000. While it was being collected, the Danes sacked Canterbury and slew the archbishop Alphege. The tribute was paid soon afterwards; and about the same time the Danish leader Thurkill entered the English service.

From 1013 an important change is discernible in the character of the Danish attacks, which now became definitely political in their aim. In this year Sweyn sailed up the Trent and received the submission of northern England, and then, marching south, attacked London. Failing to take it, he hastened west and at Bath received the submission of Wessex. Then he returned northwards, and after that "all the nation considered him as full king." London soon acknowledged him, and Aethelred, after taking refuge for a while with Thurkill's fleet, escaped to Normandy. Sweyn died in Feb. 1014, and Aethelred was recalled by the witan. At once he hastened north against Canute, Sweyn's son, but Canute sailed away, only to return next year, when the traitor Edric joined him and Wessex submitted. Canute and Edric harried Mercia, and were preparing to reduce London, when Aethelred died there on April 23, 1016. Weak, self-indulgent, improvident, he had pursued a policy of opportunism to a fatal conclusion.

Aethelred's wife was Emma, or Aelfgifu, daughter of Richard I. the Fearless, duke of the Normans, whom he married not later than 985. After the king's death Emma married Canute the Great, and after his death in 1035 she struggled hard to secure England for her son, Hardicanute. In 1037, however, when Harold Harefoot became sole king, she was banished; she went to Flanders, returning to England with Hardicanute in 1040. In 1043 Edward the Confessor seized the greater part of Emma's great wealth, and the queen lived in retirement at Winchester until her death on March 6, 1052. By Aethelred Emma had two sons, Edward the Confessor and the aetheling Aelfred (d. 1036), and by Canute she was the mother of Hardicanute. Her marriage with Aethelred was an important step in the history of the relations between England and Normandy, and J. R. Green says "it suddenly opened for its rulers a distinct policy, a distinct course of action, which led to the Norman conquest of England. From the moment of Emma's marriage Normandy became a chief factor in English politics"

Pertz in the *Scriptores Rerum Germanicarum*, Band xix, Hanover, 1866) for the latter part of the reign. *See* also J. M. Kemble, *Codex Diplomaticus aevi Saxonici* (London, 1839–48); and B. Thorpe, *Ancient Laws* (London, 1840).

**AETHELSTAN** (*c.* 894–940), Saxon king, was the son (probably illegitimate) of Edward the Elder. He had been the favourite of his grandfather Alfred, and was brought up in the household of his aunt Aethelflaed, the "Lady of the Mercians." On the death of his father in 924, Aethelstan succeeded him, and was crowned at Kingston shortly after.

AFTER G. M. COLLEN'S BRIT. SAXONICA

SHIELD OF AETHELSTAN

The cross boutonné, on a field of red and blue, is surmounted by a crest coronet of gold. The circle at the base is gold

One of Aethelstan's first public acts was to hold a conference at Tamworth with Sihtric, the Scandinavian king of Northumbria, and as a result Sihtric received Aethelstan's sister in marriage. In the next year Sihtric died and Aethelstan took over the Northumbrian kingdom. He now received, at Dacre, in Cumberland, the submission of all the kings of the island; viz., Howel Dda, king of West Wales, Owen, king of Cumbria, Constantine, king of the Scots, and Ealdred of Bamburgh, and henceforth he called himself "rex totius Britanniae." About this time (the exact chronology is uncertain) Aethelstan expelled Sihtric's brother Guthfrith, destroyed the Danish fortress at York, received the submission of the Welsh at Hereford, fixing their boundary along the line of the Wye, and drove the Cornishmen west of the Tamar, fortifying Exeter as an English city. In 934 he invaded Scotland by land and sea, perhaps owing to an alliance between Constantine and Anlaf Sihtricsson. The army advanced as far north as Dunottar, in Kincardineshire, while the navy sailed to Caithness. Simeon of Durham speaks of a submission of Scotland as a result; if it ever took place it was a mere form, for three years later we find a great confederacy formed in Scotland against Aethelstan. This confederacy of 937 was joined by Constantine, king of Scotland, the Welsh of Strathclyde, and the Norwegian chieftains, Anlaf Sihtricsson and Anlaf Godfredsson, who, though they came from Ireland, had powerful English connections. A great battle was fought at Brunanburh (perhaps Brunswark or Birrenswark hill in south-east Dumfriesshire), in which Aethelstan and his brother Edmund were completely victorious. England had been freed from its greatest danger since the days of the struggle of Alfred against Guthrum.

Aethelstan was the first Saxon king who could claim in any real sense to be lord paramount of Britain. In his charters he is continually called "rex totius Britanniae," and he adopts for the first time the Greek title *basileus*. This was not merely an idle flourish, for some of his charters are signed by Welsh and Scottish kings as *subreguli*. Further, Aethelstan was the first king to bring England into close touch with continental Europe. By the marriage of his half-sisters he was brought into connection with the chief royal and princely houses of France and Germany. His sister Eadgifu married Charles the Simple, Eadhild became the wife of Hugh the Great, duke of France, Eadgyth was married to the emperor Otto the Great, and her sister, Aelfgifu, to a petty German prince. Embassies passed between Aethelstan and Harold Fairhair, first king of Norway, with the result that Harold's son Haakon was brought up in England, and is known in Scandinavian history as Haakon Adalsteinsfóstri.

Aethelstan died at Gloucester in 940, and was buried at Malmesbury, an abbey which he had munificently endowed during his lifetime. Apparently he was never married, and he certainly had no issue. A considerable body of law has come down to us in Aethelstan's name. The chief collections are those issued at Grately, in Hampshire, at Exeter, at Thunresfeld, and

the *Iudicia civitatis Lundonie*. In the last-named one personal touch is found when the king tells the archbishop how grievous it is to put to death persons of 12 winters for stealing. The king secured the raising of the age limit to 15

(A. M.)

**AETHELWEARD** or **ETHELWARD,** Anglo-Saxon historian, was the great-grandson of Aethelred, the brother of Alfred, and ealdorman or earl of the western provinces (*i.e.*, probably of the whole of Wessex). He was the author of a Latin chronicle extending to the year 975. Up to the year 892 he is largely dependent on the *Saxon Chronicle*, with a few details of his own; later he is largely independent of it. He was the friend and patron of Aelfric, the grammarian.

**AETHELWULF,** king of the West Saxons, succeeded his father, Egbert, in A.D. 839. Aethelwulf's reign was chiefly occupied with struggles against the Danes. After the king's defeat 843–44, the Somerset and Dorset levies won a victory at the mouth of the Parret (*c.* 850). In 851 Ceorl, with the men of Devon, defeated the Danes at Wigganburg, and Aethelstan of Kent was victorious at Sandwich; despite this the Danes wintered in England that year for the first time. In 851 also Aethelwulf and Aethelbald won their great victory at Aclea, probably the modern Ockley. In 853 Aethelwulf subdued the North Welsh, in answer to the appeal of Burgred of Mercia, and gave him his daughter Aethelswith in marriage. The year 855 is the date of the Donation of Aethelwulf and of his journey to Rome with Alfred. On his way home he married Judith, daughter of Charles the Bold. According to Asser he was compelled to give up Wessex to his son Aethelbald on his return, and content himself with the eastern under-kingdom. He died in 858.

*See* Asser, *Life of Alfred* (W. H. Stevenson, 1904), 1–16; *Saxon Chronicle, s.a.* 823, 836, 840, 851, 853, 855.

**AETHER:** *see* ETHER (PHYSICS).

**AETHICUS** (=ETHICUS) **ISTER,** "the philosopher of Istria," the supposed but unknown author of a description of the world written in Greek. An abridgment, under the title of *Cosmographia Ethici,* written in barbarous Latin, and wrongly described as the work of St. Jerome, probably belongs to the 7th century.

The name Aethicus is also attached to a geographical treatise probably dating from the 6th century, a reproduction of the cosmography of Julius Honorius.

BIBLIOGRAPHY.—D'Avezac (1852); Pertz (1853); Wuttke (1854); Riese's *Geographi Latini Minores* (1878); *see* also Bunbury, *History of Ancient Geography.*

**AETIOLOGY** or **ETIOLOGY,** strictly, science or philosophy of causation, but generally used to denote the part of any special science (and especially of that of medicine and disease) which investigates the causes and origin of its phenomena. An *aetiological myth* is one which is regarded as having been invented *ex post facto* to explain some fact, name, or coincidence, the true account or origin of which has been forgotten. Such myths were often based on grotesque philological analogies, according to which an existing connection between two personalities (cities, etc.) was traced back to a common mythical origin. The preferred spelling of the word in the United States is Etiology.

**AETION** or **EETION,** a Greek painter, mentioned by Cicero, Pliny, and Lucian. His most noted work, described in detail by Lucian (*Herodotus or Eetion*, 5), was a picture representing the marriage of Alexander and Roxana. Through a misunderstanding of the words of Lucian, Aetion has been supposed to belong to the age of Antonines; but there can be little doubt that he was a contemporary of Alexander and of Apelles (Brunn, *Geschichte der griechischen Kunstler*, ii. p. 243). Pliny gives his date as 350 B.C.

**AETIUS** (ah-ĕt'ĭ-oos) (fl. 350), surnamed "the Atheist," founder of an extreme sect of Arians, was a native of Coele-Syria He studied successively under the Arians, Paulinus, bishop of Antioch, Athanasius, bishop of Anazarbus, and the presbyter Antonius of Tarsus At the first synod of Sirmium he won a dialectic victory over the homoiousian bishops, Basilius and Eustathius who sought in consequence to stir up against him the enmity of Caesar Gallus. In 356 he went to Alexandria with Eunomius (*q.v.*) in order to advocate Arianism, but he was banished by Constantius Julian recalled him from exile, bestowed upon him an estate in Lesbos, and retained him for a time at his court in Constantinople. At the accession of Valens (364) he retired to his estate at Lesbos, but soon returned to Constantinople, where he died in 367. The Anomoean sect of the Arians, of whom he was leader, are sometimes called after him *Aetians*. His work *De Fide* has been preserved in connection with a refutation written by Epiphanius (*Haer.*, lxxvi. 10).

*See* A. Harnack, *History of Dogma,* vol. iv. *passim.*

**AETIUS** (died 454), a Roman general of the closing period of the Western empire, born at Dorostolus in Moesia, late in the 4th century. He was the son of Gaudentius, who, although possibly of barbarian family, rose in the service of the Western empire to be master of the horse, and later, count of Africa. Aetius passed some years as hostage, first with Alaric and the Goths, and later in the camp of Rhuas, king of the Huns, acquiring in this way the knowledge which enabled him afterwards to defeat them In 424 he led into Italy an army of 60,000 barbarians, mostly Huns, which he employed first to support the *primicerius* Ioannes, who had proclaimed himself emperor, and, on the defeat of the latter, to enforce his claim to the supreme command of the army in Gaul upon Placidia, the empress-mother and regent for Valentinian III His calumnies against his rival, Count Boniface, which were at first believed by the emperor, led Boniface to revolt and call the Vandals to Africa. Upon the discovery of the truth, Boniface, although defeated in Africa, was received into favour by Valentinian; but Aetius came down against Boniface from his Gallic wars, and in the battle which followed wounded Boniface fatally with his own javelin. From 433 to 450 Aetius was the dominating personality in the Western empire. In Gaul he won his military reputation, upholding for nearly 20 years, by combined policy and daring, the falling fortunes of the empire. His greatest victory was that of Châlons-sur-Marne (Sept. 20, 451), in which he led the Gallic forces against Attila and the Huns. This was the last triumph of the empire. Three years later (454) Aetius presented himself at court to claim the emperor's daughter in marriage for his son Gaudentius; but Valentinian, suspecting him of designs upon the crown, slew him with his own hand.

"That he was the one prop and stay of the Western empire during his life is the unanimous verdict of his contemporaries; but whether he was a really great general or statesman we cannot tell. He was beaten by Boniface; and it was not he, but the Goths and their king, who really triumphed in the Mauriac plain; yet he recovered Gaul in a series of campaigns, and he kept the Visigoths in check. . . . If he was less Roman than his predecessor Constantius, he was far more Roman than his successor Ricimer; and if he had occasionally used the arms of the Huns for his own ends, he had also used them to maintain the empire. One merit he had which must count for much—the merit of recognizing and encouraging men of ability. Majorian and Marcellinus, two of the finest figures in the history of the fallen empire, were men of his training." (Ernest Barker in *Cambridge Mediaeval Hist.*, vol. i., I., 418–419.)

*See* T. Hodgkin, *Italy and her Invaders,* vols. i. and ii. (1880).

**AETIUS,** a Greek physician, born at Amida in Mesopotamia, flourished at the beginning of the 6th century A.D. He was court physician at Byzantium. He wrote a large medical work in 16 books, founded on Oribasius and compiled from various sources, especially Galen (Galenos). Eight books of the Greek original were printed in Venice in 1534, and a complete Latin translation by Cornarius at Basel, 1542.

*See* Weigel, *Aetianarum exercitationum specimen* (1791); Danelius, *Beitrag zur Augenheilkunde des Aetius* (1889), Zernos, *Aetii sermo sextidecimus et ultimus*, editio princeps (1901), T C. Allbutt, *Greek Medicine in Rome* (1921); M. Neuberger, *History of Medicine*, vol. i (1910)

**AETNA,** a Latin hexameter poem of 644 lines ascribed by the mss. to Virgil. This ascription is now universally rejected, but it is obvious that the author was an imitator of Virgil who was familiar with the Aeneid as well as the Bucolics and Georgics, and therefore lived at least as late as the time of Augustus. As there is no mention of the eruption of Vesuvius which destroyed Pompeii and Herculaneum it is safe to presume that the work was composed before A D. 79. The poem has been attributed by various authorities to Claudian, Cornelius Severus and Manilius, but modern opinion assigns it to Lucilius Junior, the friend of Seneca, whose interest in, and knowledge of scientific matters is alluded to in the philosopher's correspondence He is known to have been a governor of Sicily and to have written poems *Aetna* discusses the possible explanation of the volcano's action

Text edited (1920) by Robinson Ellis in J. P. Postgate's *Corpus Poetarum Latinorum.*

**AETOLIA,** a district of northern Greece, bounded on the south by the Corinthian Gulf, on the west by the river Achelous, on the north and east by the western spurs of Parnassus and Oeta The land naturally falls into two divisions. The basins of the lower Achelous (mod. *Aspropotamo*) and Euenus (*Phidharis*) form a series of alluvial valleys intersected by detached ridges which mostly run parallel to the coast. This district of "Old Aetolia" lacks a suitable sea-board, but the inland, and especially the plain of central Aetolia lying to the north of Lakes Hyria and Trichonis and Mount Aracynthus, forms a rich agricultural country. The northern and eastern regions are broken by an extensive complex of chains and peaks, whose rugged limestone flanks are clad at most with stunted shrubs and barely leave room for a few precarious mule-tracks. These heights often rise in the frontier-ranges of Tymphrestus, Oxia and Corax to more than 7,000 ft.; the snow-capped pinnacle of Kiona attains to 8,240 ft. A few defiles pass through this barrier to the other side of the north Greek watershed.

In early legend Old Aetolia, with its cities of Pleuron and Calydon, figures prominently. During the great migrations (*see* DORIANS) the population was largely displaced, and the old inhabitants long remained in a backward condition. In the 5th century some tribes were still living in open villages under petty kings, addicted to plunder and piracy, and hardly recognized as Hellenes at all. Yet their military strength was not to be despised: in 426 their archers and slingers easily repelled an Athenian invasion under Demosthenes. In the 4th century the Aetolians began to take a greater part in Greek politics, and, in return for helping Epameinondas (367) and Philip of Macedon (338), recovered control of their sea-board, to which they annexed the Acarnanian coast and the Oeniadae. Aetolia's prosperity dates from the period of Macedonian supremacy. It may be ascribed partly to the wealth and influence acquired by Aetolian mercenaries in Hellenistic courts, but chiefly to the formation of a national Aetolian league, the first effective institution of this kind in Greece. Created originally to meet the peril of an invasion by the Macedonian regents Antipater and Craterus, who had undertaken a punitive expedition against Aetolia after the Lamian War (322), and by Cassander (314–311), the confederacy grew rapidly during the subsequent period of Macedonian weakness. Since 290 it had extended its power over all the uplands of central Greece, where its command over Heracleia (280) provided it with an important defensive position against northern invaders, its control of Delphi and the Amphictyonic council with a useful political instrument. The valour of the Aetolians was conspicuously displayed in 279, when they broke the strength of the Celtic irruption by slaughtering great hordes of marauders. The commemorative festival of the Soteria, which the league established at Delphi, obtained recognition from many leading Greek states. After annexing Boeotia (by 245) the Aetolians controlled all central Greece. Endeavouring next to expand into Peloponnesus, they allied themselves with Antigonus Gonatas of Macedonia against the Achaean league (*q.v.*), and besides becoming protectors of Elis and Messenia won several Arcadian cities. Their naval power extended to Cephalonia, to the Aegaean islands and even to the Hellespont. The league at its zenith had thus a truly imperial status.

Later in the century its power began to be sapped by Macedonia To check King Demetrius (239–229) the Aetolians joined arms with the Achaeans. In 224 they held Heracleia Trachis against Antigonus Doson, but lost control of Boeotia and Phocis Since 228 their Arcadian possessions had been abandoned to Sparta. At the same time a new enemy arose in the Illyrian pirate fleets, which outdid them in unscrupulousness and violence. The raids of two Aetolian chiefs in Achaean territory (220) led to a coalition between Achaea and Philip V of Macedon, who assailed the invaders with great energy, driving them out of Peloponnesus and marching into Aetolia itself, where he surprised and sacked the federal capital Thermon. After buying peace by the cession of Acarnania (217) the league concluded a compact with Rome. In the great war of their Roman allies against Philip the federal troops took a prominent part, their cavalry being largely responsible for the victory of Cynoscephalae (197). The Romans in return restored central Greece to the league, but by withholding its former Thessalian possessions excited its deep resentment. The Aetolians now invited Antiochus III. of Syria to European Greece, and so precipitated a conflict with Rome. But in the war they threw away their chances. In 192 they wasted themselves in an unsuccessful attempt to secure Sparta. In 191 they supported Antiochus badly, and by their slackness in the defence of Thermopylae made his position in Greece untenable. Having thus isolated themselves the Aetolians stood at bay behind their walls against the Romans, who refused all compromises, and, after the general surrender in 189, restricted the league to Aetolia proper and assumed control over its foreign relations. By the time of Sulla, the functions of the Aetolian league had become purely nominal. The federal constitution closely resembled that of the Achaean league, for which it doubtless served as a model. The general assembly, convoked every autumn at Thermon to elect officials, and at other places in special emergencies, shaped the league's general policy; it was nominally open to all freemen, though no doubt the Aetolian chieftains really controlled it. The council of deputies from the confederate cities undertook the routine of administration and jurisdiction. The *strategus* (general), aided by 30 *apocleti* (ministers), had complete control in the field and presided over the assembly, though with restricted advisory powers. The Aetolians also used the Amphictyonic synod for passing solemn enactments. The league's relation to outlying dependencies is obscure; many of these were probably mere protectorates or "allied states" and secured no representation. The federal executive was certainly much more efficient than that of the Achaeans, and its councils suffered less from disunion; but its generals and admirals, official or otherwise, enjoyed undue licence; hence the league deservedly gained an evil name for the numerous acts of lawlessness or violence which its troops committed. But as a champion of republican Greece against foreign enemies no other power of the age rendered equal services. In the 15th century Aetolia passed under the rule of Scanderbeg and the Venetians, but was finally conquered for the Turks by Mohammed II. In the War of Independence it was the scene of severe fighting, including the sieges of Missolonghi.

**AFARS** (DANAKIL), a tribe of African "Arabs" of Hamitic stock. They occupy the arid coast-lands between Abyssinia and the sea. They claim to be Arabs, but are more akin to the Galla and Somali. The tribe is roughly divisible into a pastoral and a

coast-dwelling group. Their religion is chiefly fetich and tree-worship; many, nominally, profess Mohammedanism They are distinguished by narrow straight noses, thin lips and small pointed chins. They wear, generally, nothing but a waist-cloth They are divided into many sub-tribes, each having an hereditary sultan.

*See* Fr. Scazamucci and E H. Giglioli, *Notizie sui Danakil* (1884); P. Paulitschke, *Ethnographie Nordost-Afrikas* (2 vols, Berlin, 1893–1896), and *Die geographische Erforschung der Adâl-Länder und Harâr's in C* [illegible] 1884).

**AFER, DOMITIUS,** a Roman orator and advocate, was born at Nemausus (Nîmes). He became an informer and gained the favour of Tiberius by accusing Claudia Pulcra, a cousin of Agrippina, of treason. He was consul under Caligula (39) and superintendent of the water supply under Nero. He died in A.D. 60. His pupil, Quintilian, who calls him the greatest orator he had ever known, quotes some of his witty sayings (*dicta*), collections of which were published, and mentions two books by him *On Witnesses*.

*See* Quintilian, *Instit.* vi. 3. 42, viii. 5. 16, x. 1 118, etc.; Tac *Ann.* iv. 52, 68, xiv. 19; Dio Cassius lix. 19, lx. 33; Pliny, *Epp.* ii. 14, viii. 18.

**AFFECTION,** literally, a state resulting generally from an external influence. The term was at one time employed to denote the states even of material bodies, but is now confined to certain *mental* states only, in fact, to certain *feelings*. It is popularly used of a sentiment between persons amounting to more than good will or friendship. By ethical writers the word has been used generally of distinct states of feeling, both lasting and spasmodic; some contrast it with "passion," as being free from the distinctively sensual element. More specifically the word has been restricted to emotional states which are in relation to persons. In the former sense, it is the Gr. *πάθος*, and as such it appears in Descartes and most of the early British ethical writers. On various grounds, however—*e.g.*, that it does not involve anxiety or excitement, that it is comparatively inert and compatible with the entire absence of the sensuous element—it is generally and usefully distinguished from passion. In this narrower sense the word has played a great part in ethical systems, which have spoken of the social or parental "affections" as in some sense a part of moral obligation. For a consideration of these and similar problems, which depend ultimately on the degree in which the affections are regarded as voluntary, *see* H. Sidgwick, *Methods of Ethics*, pp. 345–349.

In psychology the terms "affection" and "affective" are used for the characteristic quality of experiences that are neither cognitive nor conational. As all intellectual phenomena have by some psychologists been reduced to sensation, so all feeling has been regarded as reducible to simple mental affection, the element of which all emotional manifestations are ultimately composed. The nature of this element is a problem which has been provisionally, but not conclusively, solved by many psychologists; the method is necessarily experimental, and all experiments on feeling are peculiarly difficult. The solutions proposed are two. In the first, all affective phenomena are primarily divisible into those which are pleasurable and those which are the reverse. The main objections to this are that it does not explain the infinite variety of phenomena, and that it disregards the distinction which most philosophers admit between higher and lower pleasures. The second solution is that every sensation has its specific affective quality, though by reason of the poverty of language many of these have no name. W. Wundt, *Outlines of Psychology* (trans. C. H. Judd, Leipzig, 1897), maintains that we may group under three main affective directions, each with its negative, all the infinite varieties in question; these are (a) pleasure, or rather pleasantness, and the reverse, (b) tension and relaxation, (c) excitement and depression.

Two methods of experiment have been tried. The first, introduced by A. Mosso, the Italian psychologist, consists in recording the physical phenomena which are observed to accompany modifications of the affective consciousness. Thus it is found that the action of the heart is accelerated by pleasant, and retarded by unpleasant, stimuli; again, changes of weight are found to accompany modifications of affection—and so on.

The second is Fechner's method; it consists in recording the changes in feeling-tone produced in a subject by bringing him in contact with a series of conditions, objects or stimuli graduated according to a scientific plan and presented singly, in pairs or in groups. The result is a comparative table of likes and dislikes.

(*See* FEELING)

**AFFETTUOSO** (Ital.), a musical direction signifying that the composition or particular passage so marked is to be played with much expression and feeling *Espressivo* and *con espressione* are other terms having much the same significance.

**AFFIDAVIT,** a written statement sworn or affirmed to before some person who has authority to administer an oath or affirmation. Evidence is chiefly taken by means of affidavits in the chancery division of the High Court of Justice in England on a petition, summons or motion. Interlocutory proceedings before trial are conducted by affidavits, *e.g.*, for discovery of documents, hence called *affidavit of documents*. Affidavits are sometimes necessary as proof that certain legal formalities have been duly and legally performed. On special application to the court a deponent may be cross-examined on the statements contained in his affidavit. In Scotland the testimony of witnesses by affidavit is almost unknown, except in proceedings in the Sheriff Court of Chancery, and petitions for the sequestration of bankruptcy, where affidavits are enjoined by statute. In the rules of the Supreme Court (R.S.C. Ord. XXXVIII.) certain formal requirements are laid down for all affidavits and affirmations in causes or matters depending in the High Court. An affidavit must consist of title, body or statement and jurat. It must be written or printed on foolscap, bookwise, in the first person; give correctly the names of the parties to the action; and the description and true place of abode of the deponent. An affidavit is confined, except on interlocutory motions, to such facts as the witness is able of his own knowledge to prove. The signature of the deponent must be written opposite to the jurat, which must contain the place, date and time of swearing, and this signed by the officer or magistrate before whom the affidavit is sworn. An affidavit sworn on a Sunday is not invalid. Quakers, Moravians and Separatists were first privileged to make a solemn declaration or affirmation, and by the Common Law Procedure Act, 1852, and other statutes all persons prevented by religious belief from taking an oath were allowed to affirm; and, finally, by the Oaths Act, 1888, every person who objects to be sworn is allowed to affirm in all places and for all purposes where an oath is required by law. By an act of 1835 justices are permitted to take affidavits in any matter by declaration, and a person making a false affidavit in this way is liable to punishment. The same act prohibited justices of peace from administering oaths in any matter in which they had not jurisdiction as judges, except when an oath was specially authorized by statute, as in the bankruptcy law, and excepting criminal inquiries, parliamentary proceedings and instances where oaths are required to give validity to documents abroad. Scottish justices can act in England and *vice versa*. The Oaths Act, 1888, and the Commissioner of Oaths Act, 1889, consolidated all previous enactments relating to oaths and gave the lord chancellor power to appoint commissioners for oaths to take affidavits for all purposes (*see* OATH).

In the United States affidavit has the same meaning as in England and its general uses are the same, but it is not substituted for oral evidence in court to anything like the extent to which that is done in the English courts of chancery. The statutes of each State designate the persons before whom affidavits may be made outside the State, and special commissioners are appointed for that purpose by each State. Affidavits made abroad must be made before such commissioners or persons so designated, who are usually diplomatic and consular officials, justices, notaries public or mayors.

**AFFILIATION,** in law, the procedure by which the paternity of a bastard child is determined, and the obligation of contributing to its support enforced. In England a number of statutes on the subject have been passed, the chief being the Bastardy Act of 1845, the Bastardy Laws Amendment Acts of 1872 and 1873, the

Affiliation Orders Act, 1914, the Affiliation Orders Act, 1918, and the Bastardy Act, 1923. The mother of a bastard may summon the putative father to petty sessions within 12 months of the birth (or at any later time if he is proved to have contributed to the child's support or ceased to reside in England within 12 months after the birth), and the justices, after hearing evidence on both sides, may, if the mother's evidence be corroborated in some material particular, adjudge the man to be the putative father of the child, and order him to pay a sum not exceeding 20 shillings a week for its maintenance, together with a sum for expenses incidental to the birth, or the funeral expenses, if it has died before the date of order, and the costs of the proceedings An order ceases to be valid after the child reaches the age of 13, except as regards arrears, but the justices may in the order direct the payments to be continued until the child is 16 years of age An appeal to quarter sessions is open to both the mother and the defendant, and a further appeal on questions of law to the King's Bench. Should the child afterwards become chargeable to the parish, the sum due by the father may be received by the relieving officer. When a bastard child whose mother has not obtained an order, becomes chargeable to the parish, the guardians may proceed against the putative father for a contribution, and such an order may be varied and continued in favour of the mother or person having custody of the child. Any woman who is single, a widow, or a married woman living apart from her husband, may make an application for a summons. The Bastardy Act, 1872, makes due provision for the enforcement of an order of affiliation, and commitment is governed by the Summary Jurisdiction Act, 1879, and the Criminal Justice Act, 1914. In the case of soldiers an affiliation order cannot be enforced in the usual way, but by the Army Act 1881, as amended in 1883, 1891, 1904 and 1915, if an order has been made against a soldier of the regular forces, a portion of the soldier's pay may be retained There is similar legislation with regard to sailors in the Royal Navy, by the Naval Discipline Act, 1915.

It having been found in practice that affiliation orders became ineffective owing to the unwillingness or inability of the mother to make continual appearances before the justices, under the Affiliation Orders Act, 1914, collecting officers may be appointed

In the United States the father is primarily responsible for the support of a bastard child. The mother is responsible in the event of the father's death.

In the British colonies there is some procedure (usually termed filiation) akin to that described above, by means of which a mother can obtain a contribution to the support of her illegitimate child from the putative father. On the continent of Europe, however, the legislation of the various countries differs rather widely. (*See* ADOPTION; also BASTARD; POOR LAW.)

**AFFINE GEOMETRY.** An affine geometry, as distinguished from a projective geometry, involves a definition of parallelism. Thus, when from the definitions and theorems of the ordinary euclidean geometry of the plane all those involving euclidean measurement of length and angle are eliminated, the residue is an affine geometry. In this case the line at infinity is unique, in that any two lines meeting in a point of the former are parallel. In the projective geometry of the plane there is no such preferred line; when any line is designated as preferred in this sense, we have a corresponding affine geometry. For example, in affine geometry there is a distinction between an ellipse, a parabola and a hyperbola, but not in projective geometry; moreover, only when the geometry is metrical is there a distinction between circles and ellipses.

The euclidean affine geometry is given analytic form by means of coordinates $x$ and $y$ referred to two intersecting lines of the plane in the usual manner. In this case the equations

$$\begin{aligned} x_1 &= a_{11}x + a_{12}y + a_1, \\ y_1 &= a_{21}x + a_{22}y + a_2, \end{aligned} \tag{1}$$

where the $a$'s are arbitrary constants subject to the condition $a_{11}a_{22} - a_{12}a_{21} \neq 0$, define the most general transformation of points of the plane among themselves which transforms parallel lines into parallel lines. Such a transformation is called *affine*. The transformations (1) form a group, and we may say, following Klein, that the body of definitions and theorems expressing properties of quantities invariant under this group is an affine geometry. If $x', y'$, $x'', y''$; $x''', y'''$ are the coordinates of three non-collinear points, the quantity

$$\begin{vmatrix} x' & y' & 1 \\ x'' & y'' & 1 \\ x''' & y''' & 1 \end{vmatrix} \tag{2}$$

is invariant under transformations (1) for which $a_{11}a_{22} - a_{12}a_{21} = 1$. These transformations are called *equiaffine*. There is a considerable body of theorems concerning properties of plane curves which remain invariant under equiaffine transformations. In particular, there is a metric theory based upon a certain invariant of the type (2) associated with a curve.

The foregoing concepts are readily generalized to spaces of higher order. Thus there is for spaces of three dimensions a theory of curves and surfaces analogous in many respects to the theory for euclidean space of three dimensions. The developments of these ideas have been made by many geometers, notably Klein, Mobius, Sylvester and lately by Blaschke and Pick.

Any $n$ independent variables $x_i$, where $i$ takes the values 1 to $n$, may be thought of as the coordinates of a general $n$-dimensional space, or variety, in the sense that each set of values of the $x$'s defines a point. In a space thus defined there is not a basis for the comparison of directions at different points. Such a basis is provided when a definition of parallelism is added. In Riemannian geometry we say, following Levi-Cività, that at points of a curve, defined by $x_i = f_i(t)$, $(i = 1, \cdots, n)$, a set of functions $\xi^i$ of $t$ satisfying the system of equations

$$\begin{aligned} &\xi^i\left(\frac{d\xi^i}{dt} + \sum_{k,l}^{1,\cdots,n} \Gamma^i_{kl}\,\xi^k \frac{dx_l}{dt}\right) \\ &-\xi^j\left(\frac{d\xi^i}{dt} + \sum_{k,l}^{1,\cdots,n} \Gamma^i_{kl}\,\xi^k \frac{dx_l}{dt}\right) = 0 \quad (i, j = 1, \cdots, n) \end{aligned} \tag{3}$$

are the components of a family of vectors parallel with respect to the curve; in this case $\Gamma^i_{jk}$ are functions of the $x$'s determined by the metric of the space (*see* RIEMANNIAN GEOMETRY). As thus defined, parallelism is relative to a curve, and not absolute, as in euclidean space. If the $\Gamma$'s in (3) are taken as $n^3$ arbitrary functions of the $x$'s, equations (3) may be taken as the definition of parallelism for a general $V_n$, thus generalizing Levi-Cività's concept of parallelism for spaces with a Riemannian metric. In this case we say that the space is *affinely connected*, following Weyl; the $\Gamma$'s are called the coefficients of the affine connection.

When $\Gamma^i_{jk} = \Gamma^i_{kj}$, the connection is called *symmetric*, otherwise *asymmetric*. When, and only when, the connection is symmetric, there exist preferred coordinate systems, with a given point as origin, with respect to which corresponding components of a vector at the given point and of a parallel one at a nearby point are the same. When the connection is asymmetric, there are other connections giving an equivalent definition of parallelism; the definition is unique for symmetric connections.

The fundamental curves of an affinely connected space are those whose tangents are parallel with respect to the curves; *i.e.*, they are the straight lines of the space. They are the integral curves of the differential equations obtained when $\xi^i = dx_i/dt$ in (3). Some writers call them the *paths* of the space, others *geodesics*, since they are the generalizations of the geodesics of Riemannian spaces. There are many affine connections with the same paths, so that the theorems dealing with the paths and not with a particular affine connection constitute a projective geometry. A theory of affinely connected spaces, in many respects analogous to Riemannian geometry, has been developed recently, notably by Cartan, Eddington, Einstein, Schouten, Joseph M. Thomas, Tracy Y. Thomas, Veblen and Weyl.

**AFFINITY,** in law, as distinguished from consanguinity (*q.v.*), the term applied to the relation which each party to a marriage, the husband and wife, bears to the kindred of the other. Affinity is usually described as of three kinds: (1) *direct,* that relationship which subsists between the husband and his wife's relations by blood or between the wife and the husband's relations by blood. The marriage having made them one person, the blood relations of each are held as related by affinity in the same degree to the one spouse as by consanguinity to the other. But the relation is only with the married parties themselves, and does not bring those in affinity with them in affinity with each other; so a wife's sister has no affinity to her husband's brother. This is (2) *secondary* affinity. (3) *Collateral* affinity is the relationship subsisting between the husband and the relations of his wife's relations.

The subject is chiefly important from the matrimonial prohibitions by which the canon law has restricted relations by affinity. Taking the table of degrees within which marriage is prohibited because of consanguinity, the rule has been thus extended to affinity, so that wherever relationship to a man himself would be a bar to marriage, relationship to his deceased wife will be the same bar, and *vice versa* on the husband's decease.

Briefly, *direct* affinity is a bar to marriage. This rule has been founded chiefly on interpretations of the eighteenth chapter of Leviticus. Formerly by law in England, marriages within the degrees of affinity were not absolutely null, but they were liable to be annulled by ecclesiastical process during the lives of both parties; in other words, the incapacity was only a canonical, not a civil, disability. By the Marriage Act of 1835 all marriages of this kind not disputed before the passing of the act were declared absolutely valid, while all subsequent to it were declared null. This rendered null in England, and not merely voidable, a marriage with a deceased wife's sister or niece. (*See* MARRIAGE.)

**AFFINITY, CHEMICAL,** the property or relation in virtue of which substances are capable of entering into chemical combination with each other. (*See* CHEMISTRY; VALENCY.)

**AFFIRMATION,** the declaration that something is true; in logic, a positive judgment, the union of the subject and predicate of a proposition; particularly, in law, the solemn declaration allowed to those who conscientiously object to taking an oath.

**AFFORESTATION:** *see* FORESTS AND FORESTRY.

**AFFRAY** is the misdemeanour of breaking the peace in public to the terror of the king's subjects. Fighting in public is an affray, but no actual violence is necessary, and the offense is committed even where a man arms himself with weapons so as to cause terror to the public. Abusive and threatening words alone will not amount to an affray. In 1903 at the Carnarvon assizes before Justice Wills a conviction was obtained in *Rex* v. *Meade* where the accused went about armed and discharged a loaded revolver in a public street. He was also indicted under a statute of 1328 (2 Edw. III *c.* 3). (*See* also RIOT.)

In the United States the English common law as to affray applies, subject to certain modifications by the statutes of particular states (Bishop, *Amer. Crim. Law,* 9th ed., 1923, vol. i, § 535). The Indian penal code (§159) adopts the English definition of affray, with the substitution of "actual disturbance of the peace" for "causing terror to the lieges."

**AFFRE, DENIS AUGUSTE** (1793–1848), archbishop of Paris, was born at Saint-Rome-de-Tarn, on Sept. 27, 1793. He was educated for the priesthood at St. Sulpice, where in 1818 he became professor of dogmatic theology. After filling a number of ecclesiastical offices, he was elevated to the archbishopric of Paris in 1840. Though opposed to the government of Louis Philippe, he took no part in politics, but devoted himself to his pastoral work. His episcopate is chiefly remembered for its tragic close. During the riots of June 23 to 26, 1848, the archbishop was led to believe that by his personal interference peace might be restored between the soldiers and the insurgents. Accordingly, in spite of the warning of General Cavaignac, he mounted the barricade at the entrance to the Faubourg St. Antoine, bearing a green branch as a sign of peace. He had spoken only a few words, however, when the insurgents, hearing shots and believing they were betrayed, opened fire on the soldiers, and the archbishop was struck by a stray bullet. He died on June 27, 1848, and the following day the national assembly issued a decree expressing their sorrow because of his death. The public funeral held on July 7 was, it is said, one of the most striking spectacles of its kind. The archbishop wrote several treatises of considerable value, including an *Essai sur les hieroglyphes egyptiens* (Paris, 1834).

*See* Ricard, *Les grands evêques de l'église de France au XIX^e siècle* (Lille, 1893); L. [illegible], *Denis-Auguste Affre, archeveque de Paris* (Paris, 1905).

**AFFREIGHTMENT.** Payment for the carriage of goods by water, more especially by sea, is called freight, and a bargain made between the carrier and the person whose goods are to be so carried is called a contract of affreightment. The law does not require that a contract of this kind shall be made in writing, but usually it is expressed in that form. The terms on which goods are carried by sea are, except in coasting trade, ordinarily expressed in a charter-party or a bill of lading or both. The former may be shortly described as a contract between a shipowner and a merchant for the hire or use of a ship, and the latter as a receipt for goods, stating the terms on which they are delivered to and received by a ship. A charter-party usually relates to the full cargo of a ship, and a bill of lading may do the same, but it is more often given with reference to a particular parcel of goods.

**Terms Implied by Law.**—The parties to a contract of affreightment are assumed by law (unless the contract expressly negatives or qualifies the assumption) to have dealt with each other on the footing of certain obligations included among the terms of contract. In the unusual case of no terms being expressly agreed, the implied terms alone would regulate the relations of the parties. In the common case of terms being expressly agreed, the implied terms are included, subject to any modification of them specifically and explicitly made by the express terms. It should be mentioned in passing that, where the goods are carried under bills of lading, certain terms are by statute (as explained below) included in the contract which the parties are not free to exclude even if they wish.

Subject then to any modification made by the contract, a person who for payment carries goods by sea is under an implied obligation to exercise due care and diligence. Except possibly in a case where the sea carrier is not a common carrier (*i.e.*, where he does not profess himself ready to carry goods for everybody) he has a further degree of responsibility, in that he is liable for every accident, unless caused by act of God, or of the king's enemies, or by inherent defect of the goods themselves, or by their having been sacrificed for the general safety. He also impliedly undertakes absolutely that the ship is seaworthy at the beginning of the voyage, and that he will proceed on the voyage with reasonable dispatch, and without unnecessary deviation. Seaworthy has a special meaning as explained later. The carrier may in some circumstances be entitled to claim statutory limitation of the amount of his liability.

On the part of the shipper an undertaking is implied not to ship dangerous goods without notice, and he or the person entitled to take delivery of the goods is impliedly under obligation (1) to be prepared, without notice from the carrier, to take delivery within a reasonable time after the arrival of the ship at the place of delivery, and (2) to pay freight and general average contribution (if any) before he can claim delivery of the goods. In some circumstances where performance of the contract becomes impossible the parties may be released from performance under terms deemed to be implied in the contract.

**Parties to the Contract.**—As already mentioned, the terms of contract are ordinarily expressed in a charter-party (shortly, a charter) or a bill of lading, or both. A bill of lading may be more fully described as "a receipt for goods shipped on board a

ship, signed by the person who contracts to carry them, or his agent, and stating the terms on which the goods were delivered to and received by the ship. It is not the contract, for that has been made before the bill of lading was signed and delivered, but it is excellent evidence of the terms of the contract" (Scrutton). Usually the printed form of the particular carrier is filled up in writing and signed by the captain, broker or other agent of the carrier, and the terms of the contract made or deemed to have been made before the bill of lading was given are thus reduced to documentary form. Though in form a receipt, a bill of lading is also a transferable document of title representing the goods to which it relates.

Where the contract is between a shipper and a carrier who is himself the shipowner the bill of lading binds the shipowner. In the case of a chartered ship—*i e.*, a ship hired by a charterer—the bill of lading may, according to the circumstances, bind the shipowner or the charterer. Charters are varied in form. Under some, where the shipowner parts with the whole possession and control of the ship (so that the charter amounts to a demise, a form rare in modern practice) the contract would be between the shipper and the charterer. Under other charters the charterer may merely undertake that a full cargo shall be shipped and guarantee payment of a certain freight. There the contract would be between shipper and shipowner. Where, in intermediate cases, the shipper is a person other than the charterer, the bill of lading may, according to the terms of the charter, bind the shipowner or the charterer.

**Charter-parties.**—Charters (apart from the unusual form amounting to a demise of the ship) are entered into for a voyage (or series of voyages) or for a period of time. A voyage charter commonly provides that the ship, as described, shall proceed to a named place, and there load a cargo, and shall then proceed to a named place of discharge, where the cargo is to be delivered. Freight is to be paid in a lump sum, or at a rate named on the cargo carried, or calculated in some other way. The number of days within which the charterers are to load and discharge (called lay days) is specified, and also a rate for demurrage should the ship be longer detained, with provisions to apply in the event of stoppages occurring. "Days" in a charter is understood to mean calendar days of 24 hours commencing at midnight. Sundays and holidays are included unless expressly excepted. "Working days" means all days on which work is ordinarily done at the port, excluding Sundays and holidays. Provisions as to time are frequently expressed in hours instead of days. Further clauses deal with issue of bills of lading, exceptions from liability, discharge of cargo, payment of freight, general average, ceasing of charterer's liability, brokerage, etc.

By a time charter the ship is hired to the charterers for a specified time, commencing on a certain date, when the ship is to be placed at the disposal of the charterers, at some specified place, or place to be named, to be employed in lawful trades between certain limits. The clauses deal with various matters in connection with the employment of the ship, such as payments for stores, provisions, wages, insurance, fuel, port and other charges, the appointment and giving of directions to the master of the ship, stevedoring, exceptions from shipowner's liability, arbitration, etc. A number of common forms of charter are in use containing clauses adjusted to the requirements and conditions of particular trades.

In determining the effect to be given to a charter it may be necessary to take into consideration along with its express terms other terms which, as already explained, are implied by law. Thus if a charter contains no express provision as to seaworthiness there is underlying the contract, and implied and involved in it, a warranty by the shipowner that the ship is seaworthy. The special meaning attached to this word is that the ship shall have that degree of fitness which an ordinarily careful and prudent owner would require his ship to have at the commencement of her voyage, having regard to all the probable circumstances of it. Not only must the ship be tight, staunch and strong, but also fit for the carriage of the particular kind of cargo to be carried. This implied absolute warranty of seaworthiness is fulfilled if the ship is seaworthy when she leaves her moorings, and does not include any undertaking that the ship shall continue seaworthy; but where the voyage is in stages the ship must be fit for each stage when entered upon.

There may also have to be taken into consideration, in construing a charter, trade usages or customs with reference to which the parties are presumed to have made their contract. The express terms often refer to custom (which in a charter means a settled and established practice of the port), and they may be explained by evidence of usage or custom short of alleging anything inconsistent with them. For example, stipulations as to loading or discharging cargo in a port may be thus construed Evidence of custom may be given to explain the meaning of working day at the port.

When a ship has reached the place (under a voyage charter) she is to be ready to load, and is ready to load, and the charterers have been notified of this, the ship is an arrived ship and the lay days (for loading) begin to run.

Subject to any express or implied qualification, a charterer undertakes absolutely to furnish a cargo. When he fails to furnish a full cargo the damages which the shipowner is entitled to recover for this breach of contract are called dead freight. It is the duty of the master of the ship on behalf of the owner to receive and properly stow on board the cargo to be carried, which ordinarily is to be delivered to him alongside, but this duty may be subject to modification by custom or contract.

Should a ship be detained beyond the lay days the charterer will become liable to pay for the detention. If the basis for payment has been agreed by the charter the payment is known as demurrage. If it has not been agreed or if the charter refers to a fixed number of demurrage days which has been exceeded, then the payment, or part of it, will be damages for detention, the rate of which may have to be ascertained and may be different from the demurrage rate.

A common provision in a charter is the cesser clause, which is to the effect that the charterer's liability shall cease on the shipment of the cargo to the extent to which the charter gives the shipowner a lien. Under common law the shipowner's lien on the cargo is in respect only of freight and general average contributions. The cesser clause ordinarily confirms this, and gives a lien for demurrage, and sometimes also for dead freight.

**Bills of Lading.**—Though either a charter or a bill of lading or both together may express the terms of a contract, the transactions in which no bill of lading is issued are few, because the bill of lading, in addition to its primary purpose of expressing terms of contract, serves in commerce as a transferable document of title representing the goods to which it relates. Where the charterer is also the shipper, the bill of lading, as between shipowner and charterer, is regarded as no more than a receipt which does not alter the contract contained in the charter. It is merely a receipt until used by the charterer as a transferable document of title, *i.e.*, until negotiated. Where the shipper is a person other than the charterer, the bill of lading is the evidence of the contract and does not, except by plain words incorporate or impose on the shipper the obligations of the charter. Where the shipper (whether he is the charterer or not) has indorsed the bill of lading to a holder for value, the bill of lading is the only evidence of the contract.

Apart from statutory limitations on freedom of contract presently to be referred to, a common form of bill of lading (as set out in Carver, *Carriage of Goods by Sea*), was as follows:—

"Shipped, in good order and condition, by....., in and upon the good ship called the ....., whereof.....is master for this present voyage, now riding at anchor in the port of ....., and bound for ..... (*description of goods*) marked and numbered as in the margin, and are to be delivered in the like good order and condition at ..... aforesaid (the act of God, the king's enemies, fire, and all and every other dangers and accidents of the seas, rivers, and navigation of whatever nature and kind soever excepted), unto ....., or

to his assigns, he or they paying freight for the said goods at the rate of . . , with primage and average accustomed In witness whereof, the master or agent of the said ship hath affirmed to bills of lading, all of this tenor and date, the one of which bills being accomplished the others to stand void

"Dated in . . the . . day of . . . .

"(Signed) . . . . "

Many "negligence clauses" (exceptions from liability formerly inserted to protect sea carriers) have disappeared from bills of lading as a result of legislation. In the United States the Harter act was passed in 1893. It requires the exercise of due diligence properly to equip the ship and make it seaworthy, and, subject to this being done, gives exemption from navigation risks as distinguished from carrier's risks which the act compulsorily imposes on the carrier by prohibiting the insertion in any bill of lading or shipping document of any clause whereby obligations carefully to handle and stow the cargo and to care for and deliver the same may be lessened, weakened or avoided Similar legislation was afterward passed by some of the British dominions.

More recent legislation has attempted to define by its express terms the liabilities as well as the immunities of the carrier. The Carriage of Goods by Sea act, 1924, was formulated in this way. Scheduled to it is a series of rules which are in effect standard clauses to be deemed part of the terms of bills of lading. This act is applicable to these documents when issued in Great Britain or Northern Ireland. Similar legislation has been passed in Australia, India, most of the British colonies and Belgium.

The Carriage of Goods by Sea act requires that (subject to limited exceptions) the bill of lading shall expressly incorporate as part of its terms the provisions of the rules scheduled to the act. These impose on the carrier an irreducible minimum of responsibility for the safe carriage of the goods.

Though the act thus defines the carrier's liabilities, it does not (except in the case of the implied absolute undertaking to provide a seaworthy ship) expressly exclude the implied obligations referred to above. Though an alternative basis of liability is expressly laid down, the question apparently might arise whether those obligations (other than that of seaworthiness) still exist underlying the contract and implied and involved in it. In any event the compulsory minimum of responsibility is a protection to third persons (such as endorsees) who, though not parties to the contract, may be affected by it, as well as to shippers.

As the rules scheduled to the act become part of the terms of British and Belgian bills of lading they are important, but it is not practicable to give here more than a summary.

Under the definitions in article I "Goods" includes articles of every kind except live animals and deck cargo and "carriage of goods" covers the period from the time when the goods are loaded on to the time when they are discharged from the ship.

By article II the carrier is subject to the responsibilities and liabilities, and entitled to the rights set forth in the rules.

The carrier's responsibilities and liabilities detailed in article III are to exercise due diligence to (1) make the ship seaworthy, (2) properly man, equip and supply the ship, (3) make the holds fit and safe for goods. He must also properly and carefully load, handle, stow, carry, keep, care for and discharge the goods, and issue a bill of lading showing certain particulars of quantity and condition of goods. This document becomes *prima facie* evidence of receipt by the carrier of the goods as therein described. Unless notice of loss or damage is given on delivery (or, if not apparent, within three days) delivery is *prima facie* evidence of delivery and, in any event, carrier is discharged from all liability unless suit is brought within one year. Nothing may be added lessening carrier's liability, but clauses increasing it are allowable, *e.g.*, clause making bill of lading *conclusive* evidence of shipment.

Article IV relieves the carrier from liability for loss or damage resulting from (1) unseaworthiness, unless caused by want of due diligence, (2) a number of specified perils (*e.g.*, act or neglect of the servants of the carrier in the navigation or in the management of the ship, fire, perils of the sea, act of God, etc.) which are mostly perils arising without the actual fault or privity of the carrier. Reasonable deviation is allowed. The carrier is not liable for loss or damage to goods in an amount exceeding £100 per package or unit unless value is declared before shipment and inserted in bill of lading.

Under the form of bill of lading set out above the goods are to be delivered to a named person "or to his assigns." A document in this form is by English law a negotiable instrument, in the sense that it is transferable by indorsement and delivery. A bill of lading may be indorsed by the person named in it (the shipper or the consignee) either in blank, by a simple signature on the back, or specially by indorsing and signing a direction to deliver to some other person or order. The indorsee may then transfer by indorsing in blank or specially If indorsed in blank, or made out to a name left blank, or to bearer, a bill may be dealt with by mere delivery.

The indorsement and delivery of a bill of lading transfers such property as it was the intention of the parties to the indorsement to transfer, and, by the Bills of Lading act, 1855, also transfers to the indorsee, to whom the property in the goods passes, the rights and liabilities of the shipper under the bill of lading. A pledgee is however not an indorsee to whom the property passes, and does not incur liabilities unless he takes delivery of the goods.

**Performance of the Contract.**—Reference has already been made to the implied undertakings by the carrier that he will proceed on the voyage with reasonable dispatch and without unnecessary deviation, and to the doubt whether these obligations still underlie the contract where a bill of lading has been issued subject to the statutory rules.

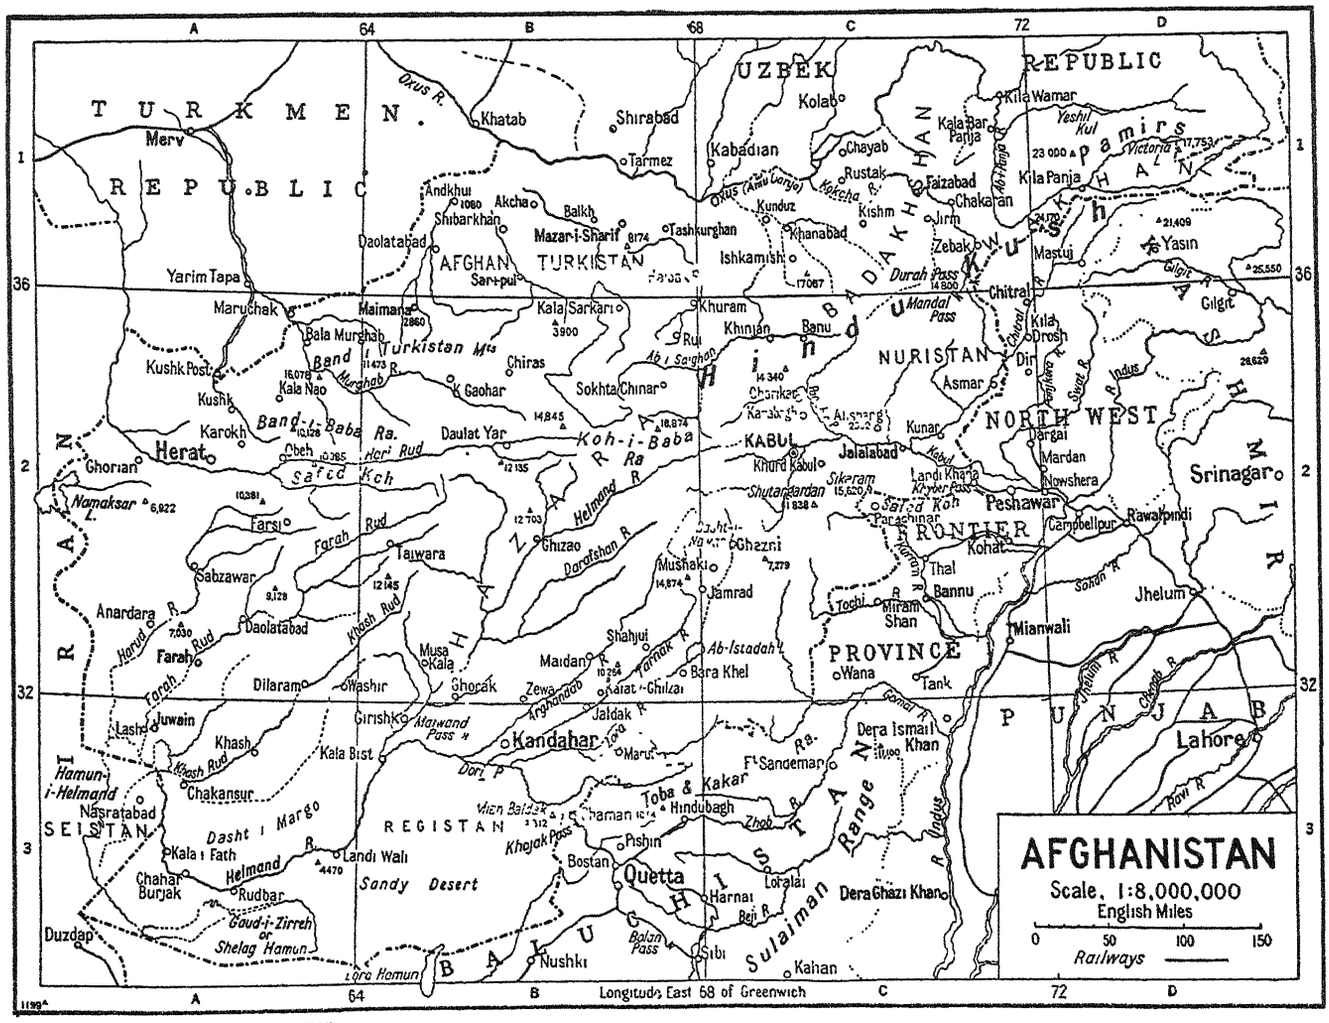
To complete the voyage the sea carrier should, if necessary, repair the ship, or tranship the cargo in order that it may be forwarded to its destination.

If necessary for the common safety a shipmaster may jettison cargo properly stowed. Any such extraordinary sacrifice or expenditure intentionally and reasonably made or incurred for the common safety, for the purpose of preserving from peril the property involved in a common maritime adventure, is a general average act. Damages, losses and expenses which are the direct consequence of a general average act are borne by ship, freight and cargo as contributing interests. The contributions are adjusted by a general average statement. If, as is commonly the case, the charter or bill of lading incorporates by reference the York-Antwerp rules, 1924, the adjustment is made as provided by those rules. (*See* further as to this under AVERAGE.)

Should the contract prove impossible of performance owing to circumstances which were unforeseen, and to which no provision in the contract is applicable (in particular where circumstances arise from the occurrence of war or in some other way, involving such delay as to frustrate the commercial purpose of the adventure) the contract may be held by the court to have come to an end by virtue of a provision implied in it. Cases of this kind are, of course, quite different from those where the contract, when made, cannot be performed without breaking the law. It is then void from the beginning for illegality.

Under the contract the ship is bound to proceed (unless prevented by an excepted peril) to the agreed place of discharge. On the ship's arrival there the charterer or consignee is bound to take delivery. Unless, under express provision, or by custom, notice of arrival is to be given, none is required. In the case of goods imported from abroad into Great Britain, if the owner of the goods fails to make entry of them at the customs, or to take delivery, the goods may, under and subject to compliance with the provisions of the Merchant Shipping act, 1894, sections 492-501, be landed and warehoused. Delivery should not be made except to a person producing a bill of lading making the goods deliverable to that person. By custom, bills of lading are made out in sets, usually of three copies, but the carrier is justified in delivering to the first person producing a bill of lading making the goods deliverable to him, if without notice or knowledge of anything making it wrong to do so.

If goods are carried to the place where the voyage is to end, and, though damaged, are in a merchantable condition and ready



for delivery, freight is payable. For delivery short of destination no freight is due unless the parties have taken steps justifying the conclusion that they intended to make a fresh contract whereby the owner of the goods has agreed to accept the goods at an intermediate port. English law in this respect differs from some continental laws under which proportional distance freight is payable. For short delivery at destination pro rata freight is payable. The carrier is entitled to a lien for freight payable on delivery. This is a possessory lien entitling him to withhold delivery until payment. It extends also to a general average contribution and to expenses incurred in the protection and preservation of the goods. If expressly so provided by the contract, the lien may extend to other matters, *e.g.*, demurrage, damages for detention and dead freight.

*See* T. G. Carver, *Carriage of Goods by Sea* (1925); T. E. Scrutton, *Charter-parties and Bills of Lading* (1925). (S. D. C.)

**AFFRETTANDO** (Ital.), a musical term having just the same significance as *accelerando, i.e.*, a quickening of the *tempo* or speed, but with a suggestion of hurry and agitation in addition.

**AFGHANISTAN**, a country of Asia. Estimated area is 245,000–270,000 sq.mi. Pop. (est. 1938) 7,000,000. It is bounded on the north by Russian Turkistan, on the west by Iran and on the east and south by Chitral and the northwestern provinces of India including Baluchistan. Surveys from 1872 to 1935 delimited this frontier which was accepted by the present (1945) government of Afghanistan. A portion of the southeastern frontier has not been demarcated.

**Boundaries.**—From the town of Zulfikar on the Hari Rud river the boundary between Afghanistan and Russia is roughly parallel to the Paropamisus, and about 35 mi. N of it, till it strikes the Kushk river at Chahil Dukhteran a few miles from the Russian post of Kushk, the terminus of the branch railway from Merv. From Chahil Dukhteran the boundary runs northeast, crossing the Murghab river near Maruchak (an Afghan fortress), and passing through the hills of the Chul, and the undulating deserts of the Aleli Turkmans, to the Oxus (Amu Darya), leaving the valleys of Charshamba and of Andkhui (to which it runs approximately parallel) within Afghan limits. These valleys define the limits of cultivation in this direction. Throughout this region the boundary is generally marked by pillars, but here and there local water partings or watercourses are used. The boundary meets the Oxus at Khamiab at the western extremity of the cultivated district of Khwaja Salar and from that point to the eastern end of Lake Victoria in the Pamirs the Oxus river forms the northern limit of Afghanistan. (*See* Oxus.) Eastward from Lake Victoria the frontier was determined by the Pamir Boundary commission (1895). A part of the little Pamir is Afghan, but the boundary crosses this Pamir before the great bend northward of the Aksu takes place, and passing over a series of crags and untraversable mountain ridges, is lost on the Chinese frontier in the snowfields of Sarikol. Bending back westward the frontier now follows the water parting of the Hindu Kush; and as the Hindu Kush abso-

JOHN BARTHOLOMEW & SON, LTD., EDINBURGH

**THE LAND OF THE AFGHANS HAS BEEN SUCCESSIVELY, IN ITS LONG AND INTERESTING HISTORY, A CONGERIES OF PETTY STATES, THE CENTRE OF GREAT EMPIRES RULED BY FOREIGNERS AND A DISMEMBERED COUNTRY, FURNISHING PROVINCES TO THREE MONARCHIES. IT IS NOW AN INDEPENDENT SOVEREIGN STATE RULED BY A KING. AS A COUNTRY FROM WHICH THE KHYBER PASS GIVES ADMISSION TO INDIA, AFGHANISTAN HAS ALWAYS POSSESSED A STRATEGIC IMPORTANCE IN EASTERN AFFAIRS**

lutely overhangs the Oxus nearly opposite Ishkashim, it follows that, at this point, Afghanistan is about 10 mi wide. Thus a small high portion of the state extends eastward from its northeastern corner and is attached to the great Afghan quadrilateral by the thin link of the Panja valley. These narrow limits (called Wakhan) include the lofty spurs of the northern flank of the Hindu Kush, which in this area is traversed by a number of high and difficult passes, the lowest and best known of which is the Baroghil (12,460 ft.). The backbone or main water divide of the Hindu Kush continues to form the boundary between Afghanistan and the North-West Frontier province of India until it reaches Nuristan. From near the Dorah pass (14,800 ft.), which connects Chitral with the Afghan province of Badakshan, a long straight, snow-clad spur reaches southward, which divides the Nuristan valley of Bashgol from that of Chitral, and this continues to define the eastern limits of Afghanistan till it nearly touches the Chitral river opposite the village of Arnawai, 45 mi. south of Chitral. Here the Bashgol and Chitral valleys unite and the boundary passes to the water divide east of the Chitral river; along this water divide it extends to the Nawa Kotal. From here to Palosai on the Kabul river the exact line is (1946) undetermined. From Palosai the line runs due south till it reaches the hamlet of Torkham at the western extremity of the Khyber pass. It then turns west following the main ridge of the Morgha and Safed Koh ranges which divide Afridi Tirah from the Eastern province, and then, rounding off the cultivated portions of the Kurram valley below the Peiwar, it crosses the Kaitu and passes to the upper reaches of the Tochi. Crossing these again, it is continued on the west of Waziristan, finally striking the Gomal river at Domandi. From Domandi (the junction of the Kundar river with the Gomal) the Afghan boundary marches with that of Baluchistan. (*See* BALUCHISTAN.) It is carried southwest mainly along the Kundar and Kadanai to a point beyond the Sind-Peshin terminal station of New Chaman, west of the Khojak range, and then drops south to Shorawak and Nushki. From Nushki it crosses the Helmand desert, touching the crest of a well-defined watershed for a great part of the way and, leaving Chagai to Baluchistan, it strikes nearly west to the Iranian frontier, and joins it on the Koh-i-Malik Siah mountain, south of Seistan.

From Koh-i-Malik Siah the boundary with Iran runs northeast till it reaches the Helmand river which it follows northward, leaving the town of Nasratabad (Nasirabad) and the Hamun to Iran. It then bends to the west as far as the Siah Koh mountain. Thence it runs through desolate country in a generally north-northwesterly direction till it turns for a short space northeast so as to leave the important valley of Yazdan within the Iranian frontier. It then turns northwest to the Namaksar (salt lake) which it crosses, and veers northeast across the Hashtadan plain to join the Hari Rud at the point where this river bends north. The boundary then follows the course of the Hari Rud to Zulfikar.

**Principal Features.**—The dominant feature of Afghanistan is the great central range of mountains which divides the country approximately from east to west. This range, known in its eastern portion as the Hindu Kush, takes off from the Little Pamir in the extreme northeast, and after forming the boundary between Chitral and Afghanistan to a point south of the Dorah pass turns westward, and spreads across central Afghanistan in a series of deep ravines and broken ridges gradually diminishing in height from the eastern peaks of 24,000 ft. Opposite Kabul and some 150 mi. to the north of it, the main ridge is about 20,000 ft. in height. Farther west it spreads out fanwise in a series of subsidiary ranges, such as the Paghman range (16,000 ft.), while the main ridge continues westward under the names of the Koh-i-Baba (15,000 ft.), the Band-i-Baian (13,000 ft.) and the Band-i-Baba (12,000 ft.), and finally the Paropamisus mountains which continue as a series of low ridges in a northwesterly direction till they reach the valley of the Hari Rud.

Round the central structure the country is divided into four main divisions depending on the four principal river systems. In the north the high pastures of Badakshan descend to the valley of the Oxus and the rich lands of Afghan Turkistan with its principal city, Mazar-i-Sharif. In the west the valley of the Hari Rud contains the city of Herat and the fertile surrounding country. In the southeast the valley of the Helmand and its tributaries water the city of Kandahar and the country to the north and east. In the centre and east the Kabul river system, which includes among its tributaries the Logar, Panjshir and Kunar rivers, waters the Kabul plateau, the rich valleys of Chardeh and Koh-i-Daman, and at a lower altitude the country of the Eastern province round Jalalabad. Subsidiary to these main divisions are the valley of the Murghab river in the northwest, and the area round the headwaters of the Kurram, Tochi and Gomal rivers in the southeast.

**Climate.**—Three main traits are characteristic; namely, extremes of temperature (both seasonal and diurnal), wind and dryness, in respect to which elevation rather than latitude is the chief deciding feature. In the north the valley of the Oxus has a temperature which may rise to 112° F. in the summer, while in Kabul and Ghazni on the southern side of the main range the maximum shade temperature rarely rises above 100° F. The minimum temperature in these areas falls as low as −10° to −15° F. in February. At Kandahar and Jalalabad on lower levels the variation is between 110° and 15° F. In the north the daily variation of summer temperature exceeds 30° F.

The heat of summer is aggravated by hot winds, particularly on the western frontier from Herat to Seistan where a wind with a velocity which reaches 110 m.p.h. blows continuously from June to September. In winter periodic blizzards from the northwest bring heavy falls of snow at altitudes of more than 5,000 ft.

The average yearly rainfall is 11 in., the greater part of which falls between December and April. An occasional shower falls in summer, but the influence of the southwest monsoon hardly extends to Afghanistan.

Generally speaking the climate is good. At altitudes in the neighbourhood of 6,000 ft. the spring and autumn are particularly fine, with clear cool days and nights and a dry invigorating atmosphere.

**Flora and Fauna.**—On the main ranges at 6,000 to 10,000 ft. grow large forest trees, among which conifers are most prominent, such as *Cedrus deodara, Abies excelsa, Pinus longifolia, P. pinaster, P. pinea* (the edible pine) and the larch. Yew, hazel, juniper, walnut, wild peach and almond are also found. Growing under the shade of these are several varieties of rose, honeysuckle, currant, gooseberry, hawthorn and luxuriant herbage, the Ranunculaceae being abundant and rich in genera. The lemon and wild vine are commonest on the northern mountains. The walnut and oak (evergreen, holly-leaved and kermes) descend to the secondary heights, where they become mixed with alder, ash, khinjak, *Arbor-vitae,* juniper, *Indigofera* and dwarf laburnum, with species of *Astragalus,* etc. Lower again and down to 3,000 ft. grow wild olive, species of rock-rose, wild privet, acacias and mimosas, barberry and *Zizyphus;* and, in places, *Chamaerops humilis* (which is applied to a variety of useful purposes), *Bignonia* or trumpet flower, sissu, *Salvadora persica,* verbena, acanthus, varieties of *Gesneria.* The lowest terminal ridges, especially toward the west, are naked in aspect. Their scanty vegetation is almost wholly herbal; shrubs are only occasional; trees almost nonexistent. Labiate composite and umbelliferous plants are most common. Ferns and mosses are almost confined to the higher ranges. On the dreary Kandahar tablelands grow many vigorous plants, such as papilionaceous *Leguminosae,* and the camel-thorn (*Hedysarum alhagi*), *Astragalus* in several varieties, spiny rest-harrow (*Ononis spinosa*), the fibrous roots of which often serve as a toothbrush; plants of the subfamily *Mimosa,* such as the sensitive mimosa; a plant of the rue family, called by the natives *lipâd;* the common wormwood; also certain orchids, and several species of *Salsola.* Rue and wormwood give domestic medicines—the former for rheumatism and neuralgia; the latter for fever, debility and dyspepsia, as well as for a vermifuge. The *lipâd,* of heavy nauseous odour, is believed to keep off evil spirits. On some sides and hollows of ravines are found rose-bay (*Nerium oleander*), called in Persian *khar-zarah,* or assbane, wild laburnum and various *Indigofera.* The chief cultivated trees are mulberry, willow, poplar, ash and occasionally the plane.

Of commercial value is the gum resin of *Narthex asafoetida* of the high and dry plains of western Afghanistan, especially between Kandahar and Herat. In the highlands of Kabul edible wild rhubarb is an important local luxury. Walnut and edible pinenut are both wild growths, which are exported. The *sanjît* (*Elaeagnus orientalis*), common on the banks of watercourses, furnishes an edible fruit. The dried tuber of a mountain orchis affords the nutritious mucilage called *salep;* a good deal of this goes to India. *Pistacia khinjuk* affords a mastic. The true pistachio is found only on the northern frontier; the nuts are imported from Badakhshan and Kunduz. Mushrooms and other fungi are also used as food.

Wild animals include the wolf, fox, hyena, wild dog, wild cat, common leopard, mongoose, wild sheep, mole, shrew, hedgehog, bats, several species of jumping mouse, jerboa and pica hare.

Bears are found in the forests and the Mongolian tiger inhabits the thick reed country of the Oxus.

Of the goat family the markhor, oorial and ibex are found in the central ranges, while the wild sheep, ovis poli and ammon inhabit the Afghan Pamirs. Two types of deer are said to exist.

There are said to be 124 specimens of birds including several varieties of pheasants, duck, teal, cranes, pelican, snipe, partridge and chikor. Smaller birds include the golden oriole, magpie, bulbul, swallow, quail and sparrow. Brown trout (*Salmo oxiensis*) are plentiful in some of the rivers of the Oxus basin; mahseer and snow trout (*chush*) are found in the rivers of the Indus watershed.

**Agriculture and Animal Husbandry.**—Afghanistan is mainly a pastoral country. Of a total area of about 270,000 sq. mi. probably not more than 20,000 sq mi. are under cultivation. The remainder consists of desert land in the south and south-east, and of highland country providing seasonal grazing throughout the year. On the whole the soil is fertile, particularly in the wide loess plains north of the Hindu Kush and in the eastern and southern areas. In these places and along the valleys wherever irrigation is possible good crops are obtained. Irrigation is carried out by means of a network of channels, often many miles in length, and sometimes subterranean (*karez*), and attention has been directed by the government to the construction of irrigation dams to conserve flood waters, and of canals. Dry farming is also practised in certain areas.

The principal crops are wheat, the staple food of a large portion of the inhabitants, rice particularly in the valleys, barley and lucerne for fodder, sugar beets, Indian corn, millet, lentils and mustard seed. Vegetables are extensively cultivated and include potatoes, carrots, turnips, onions, chillies, tomatoes, sugar cane, peas and cabbages.

Horticulture is largely practised, particularly around Kabul and Kandahar where the Sardas melon is famous. Grapes of many varieties and excellent quality are exported in large quantities to India. Other fruits include all well-known European varieties. The mulberry is grown extensively and in some localities forms the staple food of the inhabitants. Dried and crushed with walnuts it is made into a cake (*tulchan*) and stored for winter use.

Domestic animals include sheep of which immense flocks are to be found. The northern variety are famous as the producers of the Afghan lambskin (karakul). Cattle of various types are also kept in large numbers; horses, of which the northern variety (Turkoman) is the best known; donkeys, extensively used for light transport; camels of two types for heavy transport, goats and poultry.

The principal wealth of Afghanistan lies in the flocks and herds which roam the great pasture lands below the mountains. From the pastures around Andkhui come the highest quality lambskin or astrakhan, while the southern sheep provide wool, mutton and melted butter (*ghi*). The cattle are kept chiefly for milk and also provide a considerable quantity of skins and hides.

**Minerals.**—A complete geological survey of Afghanistan still (1946) remains to be carried out. The following are the principal minerals known to exist.

Extensive coal-bearing strata have been located and surveyed in the area south of Haibak and between it and Ishpushta on the north road The exploitation of this deposit which runs into many millions of tons and is said to be of good quality is hampered by the difficulties of the mountainous country in which it is situated. A survey of the country in 1937–38 disclosed favourable indications of petroleum beds in the northern provinces which, however, have proved unattractive to oil companies because of their distance from the sea. Large deposits of rock salt are worked in northern Afghanistan, while brine deposits at Andkhui and Herat supply the western part of the country. Reports of the reopening of the former gold mine near Kandahar have hitherto proved false, but alluvial deposits of gold are said to exist in the bed of the Oxus and elsewhere. Silver is reported in Hazarajat; the silver mines in the Panjshir valley are no longer worked. Large deposits of iron ore have been found on the southern side of the Hindu Kush in the Ghorband valley, and there are occurrences of lead ore elsewhere. Sulphur, gypsum and alabaster are all to be found in some quantity in the area of the Kamard valley on the northern slopes of the Hindu Kush There is a ruby mine on the Jagdalak pass east of Kabul, while lapis lazuli of high quality is found in Badakshan, though the mine has not been worked for some years.

**People.**—The term Afghan really applies to one section only of the people, but this is the dominant section known as the Durani. The Ghilzai (almost as powerful as the Durani) are believed to be of Turkish origin; the Hazaras, the Chahar-Aimak, Tajiks, Uzbegs, Nuristanis and others are more or less subject races. Popularly any inhabitant of Afghanistan is known as Afghan on the Indian frontier without distinction of origin or language; but the language division between the Parsiwan (or Persian-speaking Afghan) and the Pathan of the Indian frontier is a very distinct one. All upper-class Afghans speak the Persian language. The predominance of the Afghan in Afghanistan dates from the mid-18th century, when Ahmad Shah carved out Afghanistan from the previous conquests of Nadir Shah and called it the Durani empire.

The Durani Afghans claim to be Ben-i-Israel, and insist on their descent from tribes carried away captive from Palestine to Media by Nebuchadrezzar. Yet they also claim to be Pukhtun (or Pathan) in common with all other Pushtu-speaking tribes, whom they do not admit to be Afghan. The bond of affinity between the various peoples who compose the Pathan community is simply the bond of a common language. All of them recognize a common code or unwritten law called Pukhtunwali, which appears to be similar in general character to the old Hebraic law, though modified by Mohammedan ordinances, and strangely similar in some points to Rajput custom. Besides their division into clans and tribes, the whole Afghan people may be divided into dwellers in tents and dwellers in houses; and this division is apparently not coincident with tribal divisions, for of several of the great clans at least a part is nomad and a part settled. Such is the case with the Durani and with the Ghilzai.

**Dominant Stock.**—Afghans have fine figures, aquiline profiles, fair complexions and a small group yielded an average cephalic index of 74.8, a value nearer to that found among Rajputs in Indian than to that among the Pukhtun (Pathan) groups (av. ceph. ind. 80–83) of the Indian frontier or to that among some of the subject peoples. Among the latter, the Hazaras are tall, very broadheaded (av. ceph. ind. 85.0) and akin in feature to peoples of parts of Turkistan and Mongolia; they are said to have been planted in Afghanistan by Jenghiz Khan, and they inhabit especially the mountains west of Kabul. The Tajiks are as broadheaded as the Hazaras but belong to the pale rosy-skinned rather than to the yellow-skinned stock; they seem to be an old-established, settled, agricultural people.

Tribal law, with the custom of hospitality, and the vendetta in many forms are rules of life, and even the settled Afghan is very much a soldier. They have great power of endurance, and are frequently lawless and fanatical But their character is lightened by a sense of humour, and a ready wit and courtesy which makes them pleasant to deal with, though in business affairs poverty has made them often avaricious and hard bargainers. Among their rulers are to be found men of fine character and discrimination

who are essaying the task of civilizing a difficult people with some success.

The cultivators, including owners, tenants, labourers and slaves, are skilled irrigators, utilizing every fragment of profitable land; some of the Ghilzai are specially skilled in boring underground water channels (*karez*). The settled folk live chiefly in village communities and leave handicraft and commerce largely to subject races save that some Ghilzai are wandering traders (*powindaks*). Afghanistan is a stronghold of Islam, of the Sunni sect for the most part, though the Hazaras and others are Shiah. The last stronghold of idolatry, Kafiristan, to the north of Jalalabad was subdued in 1895 and the people converted to Islam, their country's name being changed to Nuristan, or "Land of Light." Some of the Durani Afghans of Kandahar and Zamindawar districts are very fanatical "Ghazis," that is, men who have vowed their lives to the extinction of other creeds.

**Language.**—Pushtu, the language of the Pathans, is spoken by about one-third of the population, and principally in the eastern and southern areas. It belongs to the Aryan subdivision of the Indo-European group of languages, and is divided into two main divisions, the soft dialect spoken in the Kandahar area and the hard spoken by the eastern tribes. An endeavour is being made to convert it into the national language, but difficulties of vocabulary and pronunciation tend to preserve as the official language a somewhat archaic form of Persian which is spoken at court, and widely used by Tajiks, by the Mongols of Hazarajat and other non-Pathan inhabitants of central Afghanistan. Turki is spoken by the Uzbegs and other tribes of Turkish origin to be found in northern Afghanistan. Pushtu has no literature in the accepted sense of the term. A Khattak chief of the 17th century, Khushal Khan, wrote ballad poetry of a virile type, and at different times after that there have been Afghan verse writers. A collection of songs of the Afghans is in existen[illegible] little artistic merit.

**Administration.**—Until the accession of Amanullah in 1919 the government of the country was an absolute monarchy. After that time a system of democratic government was evolved, but evolution was inevitably slow in so backward a country and much power still rests in the hands of the king and his immediate advisers.

The administration is carried on by a national council (*Majlis-i-Shura-i-Milli*) composed of approximately 110 members elected from the various provinces at three yearly intervals, and by a house of nobles (*Majlis-i-Aiyan*) of 45 persons appointed by the king. The executive body is the cabinet consisting of the prime minister and 14 other ministers, and includes a minister for national defense, interior, foreign affairs, justice, commerce, revenue and education. In addition there is a national assembly (*Loe Jirga*) consisting of more than 1,000 delegates from all provinces which meets only at times of great national emergency.

For administrative purposes Afghanistan is divided into seven major and two minor provinces, Kabul, Kandahar, Herat, Mazar-i-Sharif, Eastern province, Southern province and the Kataghan and Badakshan province. The minor provinces are Farah-Chakansur and Maimana. Each province is in charge of a governor and is subdivided into districts (*Hakumat*). The governor is assisted by local officials in charge of revenue, justice, communications, health and so on. The ten larger towns are controlled by municipal committees under a president (*Rais-i-Baladiyah*).

All Afghan subjects and foreigners of non-diplomatic status are subject to Mohammedan religious law (*Shariat*). A code of laws is in existence but its provisions are complicated and not easily understood by the general public. The courts range from the police (*Haquq*) court to the high court of appeal (*Tamiz*). Punishments vary from the death sentence which requires confirmation by the king to fines.

No budget of national income and expenditure is published but the annual revenue is believed to be in the neighbourhood of $16,000,000. The main sources of revenue are land taxes and customs duties.

After 1931 primary education was compulsory. Secondary schools were established in the main centres, while for higher education Afghanistan still relies on the universities of India and other foreign countries to which selected students are sent each year.

**Communications.**—There are no railways in Afghanistan. Main roads connect the principal centres of the country and link up with the Indian road system at Torkham and Chaman, and with Iran at Islam Kila west of Herat. A road driven through the passes of the Hindu Kush to connect Kabul directly with the northern provinces was opened in 1933. The main roads though usually metalled and fit for wheeled traffic are rough and often impassable through snow in the winter months. A system of fairweather secondary roads was being developed throughout the country in 1946. There is no regular air service in Afghanistan. The Russians maintain an irregular air service for the conveyance of mail and diplomatic personnel while a service connecting Kabul with Berlin was operated for a short time in 1938–39 by the Luft-Hansa company.

Afghanistan is a member of the International Postal and Telegraph union. Post offices have been established in the principal towns and regular motor mail services are in operation. A telegraph and telephone system links the provinces with the capital, while a world-wide radio installation connects Kabul with the outside world.

**Commerce and Industry.**—The plan for the economic development of Afghanistan adopted by Nadir Shah and his advisers in 1932 was based on the partial industrialization of Afghanistan. This plan included the installation of hydroelectric works, the erection of textile factories, of machinery for the extraction of sugar from beet and of cotton ginning and other plants. The principal object of these schemes is to enable Afghanistan to be self-supporting so far as possible in certain essential commodities, and so avoid the necessity for extensive importation of basic requirements. At the same time state-controlled companies have been formed to regulate the purchase and sale of the principal imports and exports, while the financial equilibrium of the state is [illegible] by the establishment of a national bank with branches at home and abroad.

The principal export commodities are the Afghan lambskin, of which more than 1,000,000 are exported annually; wool; cotton; fruit, both fresh and dried; nuts; hides and skins; cattle felts; sheepskin coats (*postins*); carpets; asafoetida; and timber. Imports consist principally of textiles, piece goods, sugar, petroleum products, machinery, hardware and manufactured rubber goods.

The greatest volume of trade is with India and Russia except for the export of lambskins, the principal market for which was (1945) the United States.

**Archaeology.**—There is an extensive field for archaeological research in Afghanistan. A French archaeological mission enjoyed a monopoly of research after 1922, and did much valuable work among the Buddhist remains at Hadda near Jalalabad, at Bamian, where the famous giant statues of Buddha cut in the cliff face still stand, and around Kabul. Their discoveries include a remarkable find in 1938 at Begram, site of one of Alexander's cities, and subsequently a principal city of the Kushan empire. But much remains to be done. The ruins of Balkh (Mother of Cities) near Mazar-i-Sharif, and once a great entrepôt for trade between China and the west, are still untouched, the Sasanian cities of Seistan still lie half buried in the sand, and Mahmud's great city of Ghazni awaits excavation. In addition there are many areas in Wakhan on a branch of the old silk road, on the Indian frontier and in the valleys of the Hindu Kush which have yet to be explored (1945).

**The Armed Forces.**—The organization of the army is based on a scheme formulated in 1917 for an establishment of six corps with headquarters at Kabul (two corps), Jalalabad, Matun, Herat and Mazar-i-Sharif. Additional corps or divisions are now located at Kandahar, Ghazni, Urghun, Khanabad and Gardez. Recruitment is on a voluntary basis with some element of compulsion since quotas are allotted to areas. The total strength of the army in 1939 was about 60,000, but was raised during the

World War II period, chiefly by the recall of discharged men. It is probable that in the event of war numbers could be raised to 100,000 with 300,000 to 400,000 armed levies. The forces are armed with modern weapons including a few tanks. Military schools under Turkish supervision are in operation A certain amount of motor transport was purchased to increase the mobility of the army, and reorganization is in progress with the object of providing a central reserve at headquarters from which a mobile striking force could be furnished to support provincial troops.

A small air force is in existence and provides a useful means of carrying out reconnaissance in a country where communications are difficult and of overawing unruly tribesmen.

The king is head of the armed forces, and is advised by a minister of national defense, who is also commander in chief.

## HISTORY

The geographical term Afghanistan ("land of the Afghans") is an anachronism as applied to the country before 1747, when it first became a separate and independent state, and though it is now the official name of the kingdom it is not in common use among the Afghans.

The Afghan chroniclers call their people *Ben-i Israil,* or "Children of Israel," and claim for them descent from King Saul, whom they call *Tālūt,* through a son named Jeremiah, who is said to have had a son named Afghana; but this legend assumes so many conflicting and improbable forms that it may be safely regarded as a late invention. According to one account Afghana was settled by Sulaiman (Solomon) in the Sulaiman mountains, and according to another, evidently connected with the account of the captivity of the Ten Tribes, his descendants were removed from Palestine by Nebuchadrezzar and found their way to the mountainous country about Herat. Another legend related that in pre-Islamic times Bilo (father of the Biluchis), Uzbak (father of the Uzbaks) and Afghana were considered as brethren. The historian Firishta cites a legend which makes the Afghans Copts, of the race of pharaoh; and the Afghans explain their conversion to Islam by a story to the effect that nine years after Mohammed's announcement of his mission a holy man named Kais, sent to Medina to make inquiry of him, became a zealous Moslem and on his return converted his countrymen, adding that all true Afghans are descended from Kais and his three sons, but ignoring the other descendants of Afghana. Omitting the legend which attributes to the Afghans a Coptic descent we find the grandson of King Saul made contemporary with Mohammed Uzbak Khan, who flourished in the 14th century, as well as with King Solomon; and Kais, whose name suggests Kish, Saul's father, made contemporary with the prophet Mohammed.

Despite these and other discrepancies some intelligent British officers, well acquainted with the Afghans, have accepted the story of their Hebrew descent. Their belief has been based on certain Afghan customs and on the fancied resemblance of a well-known type of Afghan physiognomy to the physical characteristics of the Jews; but the Afghans, as Moslems, have many customs similar to those of the Hebrews, and they share their physical resemblance to the Jews with other rāces in no way connected with them.

**Early Period.**—Until 500 B.C. Afghanistan formed part of the Achaemenian empire, and comprised the ancient provinces of *Aria,* or Hari Rud; *Bactria,* or Balkh; *Drangiana,* or Seistan and the Helmand valley; *Arachosia,* or Kandahar; and *Paropamisus,* the region of the Hindu Kush and Kabul. The population in the north was Iranian, and in the south contained a large Indian element; but the most interesting people mentioned in the Greek records are the *Paktyes* in Arachosia, which Herodotus calls *Paktyike,* for in their name we may trace that of the *Pakhtun* or Pushtun, by which the Afghans still describe themselves. The story of Alexander's campaign in the eastern provinces of the Persian empire need not be repeated here, but the cities of Herat (Alexandria Arion) and Kandahar (Alexandria Arachosion) were either founded or restored by him.

He was succeeded in the eastern provinces of his empire by Seleucus Nicator, the founder of the Seleucid dynasty, but the Indian provinces and the Kabul valley fell to Chandragupta (*Sandracottus*), the founder of the Maurya dynasty.

**Greek Dynasty.**—As the power of the Seleūcids waned an independent Greek dynasty was established, about 246 B.C., in Bactria, and about 50 years later annexed a great part of northwestern India, but Afghanistan passed from its possession into that of the Parthians (who occupied its western provinces), and the Sakas, a Scythian tribe, who conquered the eastern provinces about 130 B.C. and gave their name to Seistan (*Sakastan* or *Sakastene*). Within 200 years the Yue-chi (*q.v.*), another central Asian tribe, expelled the Parthians and founded the Kushan dynasty, which ruled Afghanistan, and, at the height of its power, northern India, as far as Benares on the east and Malwa on the south This dynasty adopted the Buddhist religion, and Kanishka, the greatest king of the line, convened the great council which settled the canon of northern Buddhism, and is mentioned as a champion of Buddhism by Hiuen Tsang, the Chinese pilgrim; al-Biruni, the Mohammedan traveller, philosopher and geographer; and in the Mongol versions of the Buddhist story.

The empire of Kanishka did not long survive his death, but Kushan principalities continued in the southeastern valleys of the Hindu Kush, until they were overrun by the Ephthalites, or White Huns, who held possession of northern and eastern Afghanistan in the 5th and 6th centuries A.D.

**The Caliph Empire.**—The title of Arab conquest and Islamic propaganda in the 7th century reached western Afghanistan, and penetrated as far as Kabul where, however, Hindu dominion soon afterward asserted itself. As the power of the caliphs declined their provincial governors founded dynasties owning a nominal allegiance to them but virtually independent. One of the earliest of these was the Arab dynasty of the Tahirids, who included Herat and Balkh in their kingdom of Khurasan, in which they were succeeded by a native Persian dynasty, the Saffarids, who were overcome in the 9th century by the Samanids of Balkh and Bukhara, another Persian house. Alptigin, a Turkish slave of this house, established himself in Ghazni, where he was succeeded, after a short interval, by another Turkish slave, Sabuktigin, who threw off the yoke of the Samanids and annexed to his dominions not only the Hindu kingdom of Kabul, but the territory lying between it and the Indus. Assistance given by him to the Samanids was rewarded with the government of Khurasan, to which he appointed his elder son Mahmud, and Afghanistan became the nucleus of a great empire. Sabuktigin died in 997, and his son Mahmud, after deposing a younger brother, ascended the throne in 998. The tale of his predatory raids into India need not be repeated here. He added to his empire Baluchistan, and, later in his reign, the Indian kingdom of the Punjab, the province of Multan and the greater part of western Persia, and divided with Ilak Khan, the founder of a Turkish dynasty in Transoxiana, the dominions of the house of Saman, which came to an end during his reign.

The hitherto obscure town of Ghazni now became a great and splendid city, for Mahmud was no mere ravager and despoiler. It is in Mahmud's reign that we first hear of the small state of Ghor, in the ranges southeast of Herat, which Mahmud reduced to vassalage, and the rulers of which, eventually, extinguished his dynasty. He himself paved the way for the destruction of his empire by admitting into Khurasan the Seljuk Turks, who afterward stripped his descendants of their possessions in the north and west and founded a great empire on the ruins of that of Ghazni.

Mahmud died in 1030 and his descendants continued to reign over a gradually diminishing empire, with Ghazni as their capital, until 1140, when Alauddin Husain, chief of Ghor, to avenge the death of his brother, Saifuddin, who had been treacherously put to death by the sultan of Ghazni, captured and burnt the city, driving Mahmud's descendant, Khusrav Shah, into the Punjab. The destruction of the great city of Ghazni earned for its author the cognomen of *Jahansuz,* "the World-Burner."

**Ghor Dynasty.**—In 1186 the World-Burner's nephew, Muizzuddin Mohammed, commonly known as Mohammed Ghori,

treacherously enticed Khusiav Malik, the last of the Ghaznavids, from Lahore, and imprisoned him for the short remainder of his life. Having secured the Punjab, Mohammed invaded India, and founded there a Moslem empire which endured, in name at least, until 1858.

This dynasty of Ghor is commonly believed to have been of Afghan origin, but the belief rests on a very slender foundation of evidence. Legend also assigns it descent from Zahak; and though this is no better attested than their Afghan genealogy, it seems to be probable that they were Tajiks of Persian race. The Afghans themselves are Indo-Iranian by race, and their antiquity as a separate people is uncertain. Firishta's statement that the inhabitants of the Sulaiman mountains were known as Afghans in the 1st century of the *Hijra* (the 7th century of the Christian era) carries no weight, but the name occurs in al-'Utbi's *History of Sultan Mahmud,* written about A.D. 1030, coupled with that of the Khalaj or Khaljis, who were apparently a Turkish tribe domiciled in western Afghanistan, but always antagonistic to the true Afghans. Both names occur in the history of India during the 13th and 14th centuries, and the Indian historians are not careful to distinguish between the two peoples. Hence it is, probably, that some Europeans have carelessly classed all the five dynasties which preceded the Timurids on the throne of Dihli as "Pathans," or Afghans, though in fact two of them were Turkish, one was Khalji and one was of Arab descent.

The Moslem empire in India was founded by a manumitted slave of Mohammed Ghori, and shortly after Mohammed's death his great empire fell to pieces and was divided between provincial governors and members of his own family holding small principalities in Afghanistan. These petty princes were subdued by the shahs of Khvarazm, or Khiva, of whose great but ephemeral empire Afghanistan for a time formed part.

**Mongol Rule.**—In the 13th century Afghanistan, like Persia, suffered the dreadful calamity of invasion by the heathen Mongols of Jenghiz Khan, who settled to the north of the Hindu Kush; but the rest of the country, owing to its inhospitable nature, suffered less than more fertile and populated lands. It was here, however, that the gallant Jalaluddin, last of the shahs of Khvarazm, made his most strenuous efforts to avenge on these savages the annexation and devastation of his kingdom.

The greater part of Afghanistan remained under Mongol rule until the rise of Timur Lang (Tamerlane), who established himself in northern Afghanistan in the latter part of the 14th century, wresting Herat from the Kurts, a family which claimed descent from the princes of Ghor (*see* MONGOLS).

**The Moghul Empire.**—In 1504, Babur, fifth in descent from Timur, having been expelled from his ancestral dominions in Transoxiana, occupied Kabul and made it the capital of a kingdom which he established in Afghanistan; and in 1522 he captured Kandahar from the Arghans, a Moghul family which had long held it, but he did not remain long content with his Afghan kingdom. In 1526 he invaded India, defeated Ibrahim Lodi, the Afghan sultan of Delhi, on the field of Panipat, and founded the state which is usually known to Europeans as the Moghul empire, though Babur was no Moghul, and would have resented the designation. Kabul and Kandahar remained for the time merely provinces of Babur's Indian empire, and Herat fell into the hands of the Safavi shahs of Persia.

Babur's son, Humayun, was expelled from India by the Afghan, Sher Khan, and was compelled to seek an asylum with Shah Tahmasp of Persia, who helped him to recover Kandahar, held by his rebellious brother. From Kandahar Humayun proceeded to Kabul, from which city he ousted another brother, and after spending seven years in re-establishing his authority in Afghanistan was able, in 1554, to recover his Indian empire, but died shortly afterwards, as the result of an accident, leaving the task of extending and consolidating the dominions of his house in India to his young son Akbar (*q.v.*), the real founder of the "Moghul" empire of India.

Afghanistan was then divided, Kabul remained a province of India, and Herat a province of Persia; Balkh fell to the Uzbegs of Transoxiana, and Kandahar, after remaining for a time in the possession of the Timurids, was taken by the Persians Akbar's grandson, Shah Jahan, recovered Balkh and the surrounding country which he held for another ten years till Uzbeg pressure finally caused the Moghuls in 1648, to relinquish hold of their provinces beyond the Hindu Kush.

In 1708 the Ghilzais of Kandahar, who perhaps represented the Khalaj, provoked by the oppressive rule of the Persian governor, Shahnavaz Khan, a Georgian prince of the Bagratid house, rose under Mir Vais and expelled the Persians. Mir Vais defeated the Persian armies sent against him and established his independence, but died in 1715. His son Mahmud, carrying out a project of his father's, invaded Persia, besieged Isfahan and in Oct. 1722 compelled Shah Husain, the feeble Safavid, to surrender his crown to him, but the rule of the Ghilzais in Persia was brief—Mahmud died mad and his successor, Ashraf, was defeated by Nadir Kuli, the Afshar, who shortly afterward ascended the throne. In 1737–38 Nadir Shah, one of Persia's greatest monarchs, recovered Kandahar and conquered the Indian province of Kabul, but conciliated the Afghans and enlisted many in his army—among them Ahmad Khan, a young chieftain of the Sadozai family of the Abdali tribe. Ahmad Khan rose to high rank in the Persian army, and after the assassination of Nadir Shah in 1747 was chosen by the Afghan chiefs at Kandahar as their leader and assumed the royal title Among his titles was that of *Durr-i-Dauran,* "the Pearl of the Age," from which his tribe received the name of Durani.

The land of the Afghans had been successively a congeries of petty states, the centre of great empires ruled by foreigners and a dismembered country, furnishing provinces to three monarchies. It now became, for the first time, a distinct political entity, ruled by an independent native sovereign.

Ahmad Shah Abdali extended his kingdom westward nearly to the Caspian and eastward over the Punjab and Kashmir, which he wrested from the feeble successors of Babur on the throne of Delhi. He claimed and commanded the allegiance of Sind, which had been ceded by Mohammed Shah of Delhi to Nadir Shah. His northern boundary was the Oxus, and Baluchistan and Khurasan were tributary states of his kingdom. At the third battle of Panipat, fought on Jan. 14, 1761, he inflicted on the confederate Maratha chiefs, who were then at the zenith of their power and were the real masters of the great empire founded by Babur and Akbar, a crushing defeat, and with inferior numbers nearly annihilated their great army.

**Foreign Influences.**—Ahmad Shah died in 1773 and was succeeded by his son Timur, who transferred his residence from Kandahar to Kabul. In his reign Sind was lost, Balkh and other districts in Afghan Turkistan became virtually independent, and the seeds of revolt were sown in Khurasan and Kashmir. He died in 1793, leaving 23 sons, of whom the fifth, Zaman Mirza, by the help of Payinda Khan, head of the Barakzai family of the Durani ascended the throne. His reign was short and troubled and was marked by one act destined to have momentous consequences—the grant of Lahore, in 1799, to the Sikh adventurer, Ranjit Singh. In the following year Mahmud, another son of Timur, ousted Zaman Shah and ascended the throne, but in 1803 was deposed by conspirators who placed his brother, Shuja-ul-Mulk, on the throne. In 1809 the East India company's government in India, alarmed by the intrigues of Napoleon in Persia, sent Mountstuart Elphinstone as envoy to Shah Shuja at Peshawar, but Napoleon's ambitious eastern schemes came to nought, and the British mission at Peshawar was unable to effect anything, for Shah Shuja's rule was unpopular, and while his army was engaged in quelling a rebellion in Kashmir his deposed brother, Mahmud, rose in rebellion, defeated him and put him to flight, and ascended the throne for the second time. In 1815 Shah Shuja took refuge in India and remained a pensioner of the Indian government until, at a later date, a use was found for him. Mahmud ruled until 1818 but the real ruler of the kingdom was Fath Khan the Kingmaker, the eldest son of Payinda Khan Barakzai. It was he who recovered Herat, which had been seized by the Persians, and in the insolence of his power he ventured to offer a gross outrage to the Sadozai

family. Mahmud, already chafing under Fath Khan's yoke, avenged the insult by causing him to be blinded, and Mohammed Azim and Dost Mohammed, the minister's brother and half-brother, rose in arms against Mahmud, who retorted by causing Fath Khan to be put to death with torture. The Barakzais prevailed and in 1818 drove Mahmud from Kabul and dethroned him. A period of anarchy then ensued. Mohammed Azim ruled Kabul, but his brothers and other Afghan chiefs, the provincial governors, withheld their allegiance from him and the kingdom fell to pieces. Herat, always a Persian rather than an Afghan town, was alienated; Afghan Turkistan and Badakhshan regained their independence, and Ranjit Singh, who had already conquered Kashmir, Multan, Dera Ghazi Khan and Attock, was threatening Peshawar, which he secured by defeating the Afghan army at Naushahra in 1823. In the same year Mohammed Azim died, and the remaining Barakzai brothers plunged into a fratricidal war. Three years later Dost Mohammed established himself in Kabul, Ghazni and Jalalabad, and, having secured this fragment of the Afghan kingdom, assumed the title of amir, after having, in 1835, defeated an attempt by Shah Shuja to regain his throne.

Russia had succeeded France as the bugbear of British administrators in the east, and the fear of Russian intrigue, as well as the prospect of active hostilities between the Amir Dost Mohammed and Ranjit Singh, induced the company's government to despatch an envoy, Sir Alexander Burnes, to the court of the amir. His mission was ostensibly commercial, but he was instructed to oppose the attempt of the shah of Persia to recover Herat. He was well received, but the amir was disappointed by his refusal to pledge his government to aid him against Ranjit Singh, and consequently held himself in no way bound to refuse to receive Captain Vikovitch, a Russian officer who then arrived in Kabul. The governor-general, Lord Auckland, peremptorily demanded his dismissal and the renunciation of all claims to the Punjab and Kashmir, which Ranjit Singh had recovered from the Afghans, and rashly decided to make Dost Mohammed's natural refusal of these demands a *casus belli*, and to attempt to restore the fugitive Shah Shuja, who had already been tried and found wanting. Ranjit Singh, whose material interests were involved, bound himself to co-operate with the British, but when all was ripe for the invasion declined even to permit British troops to cross his territories, though a Sikh force, with Sir Claud Wade and a small British detachment, advanced through the Khyber pass.

The "Army of the Indus," numbering 21,000, assembled in upper Sind in 1838 and advanced through the Bolan pass under the command of Sir John Keane. It met with hardly any resistance and in April 1839 occupied Kandahar, where Shah Shuja was crowned in his grandfather's mosque. On July 21 Ghazni was taken by storm and Dost Mohammed, deserted by his troops, fled northward. On Aug. 7 Shah Shuja, escorted by the British army, entered Kabul. It was believed that the war was over, and Sir John Keane, who received a peerage for his services, returned to India with the greater part of the army, leaving Sir William Macnaghten as envoy and Sir Alexander Burnes as his colleague, with 8,000 British and company's troops and the contingent which had been raised for the service of Shah Shuja for their protection. The trouble was in fact only beginning, for the best of rulers is not acceptable to a free people when imposed upon them by foreign arms, and Shah Shuja had already rendered himself odious to the Afghans. He now, acting on the advice of the British resident, attempted to raise a regular army to take the place of the tribal militia under its hereditary leaders; but the opposition of the chiefs, who apprehended the diminution of their own power and influence and the extinction of their country's independence, ensured the failure of this design. Shah Shuja was obliged to rely more and more upon British assistance, and his rule grew daily more unpopular. A danger was removed by the surrender of Dost Mohammed, who was sent to India, but it was impossible to save Shah Shuja, and in Nov. 1841 discontent at Kabul culminated in a revolt in which Burnes and other officers were massacred. Akbar Khan, the son of Dost Mohammed, placed himself at the head of the national party, and at a conference with the British authorities stabbed Sir William Macnaghten with his own hand. The British agreed to evacuate the country, and, in accordance with a convention with the Afghans, the garrison, then reduced to 690 British and 3,810 Indian troops, with the enormous number of 12,000 followers, marched out of Kabul on Jan. 6, 1842. The Afghans made no pretense of observing the terms of the convention, and the retreat of the demoralized army in the depth of a severe winter was a scene of confusion and massacre. On Jan. 13 the survivors of the force mustered at Gandamak only 20 muskets, and Dr. William Brydon, the sole survivor of the army of Kabul, except those whom the Afghans had captured, reached Jalalabad alone. The garrison of Ghazni had been obliged to surrender, but Kandahar was held by General William Nott and Jalalabad by General Robert Sale. In April 1842 Shah Shuja was assassinated.

Preparations were made in India to avenge these disasters and to recover the prisoners. In April 1842 General George Pollock forced the Khyber pass and relieved Jalalabad, and in September reoccupied Kabul, where he was joined by General Nott from Kandahar, who had recaptured and dismantled Ghazni. The prisoners were recovered from Bamiyan, where the Afghans had lodged them, and the army evacuated Afghanistan in Dec. 1842 after destroying the citadel and the central bazaar of Kabul. Dost Mohammed was permitted to return to his country and assumed the government, with the title of amir.

In 1848, during the second Sikh war, Dost Mohammed was induced to go to the aid of the Sikhs. The adventure was unfortunate for him, for at the battle of Gujarat, in Feb. 1849, his cavalry was ignominiously routed and pursued as far as the hills, and the Peshawar territories were annexed to British India and thus lost to Afghanistan. Balkh was recovered in 1850 and Kandahar in 1855, in which year also a treaty of peace was concluded between him and the British government at Peshawar. In 1856 the Persians captured Herat but were obliged to surrender it to an independent ruler after the British expedition to Persia. In 1857 the amir met, at Peshawar, Sir John Lawrence, who promised him arms and a subsidy to aid him in defending his country against Persia, and a British mission under Major Lumsden was received at Kandahar. During the Indian mutiny the amir declined to listen to those who instigated him to aid the rebels, and remained faithful to his alliance.

In 1863 Dost Mohammed captured Herat after a long siege, and, dying almost immediately afterwards, was succeeded by his son Sher Ali Khan, the early years of whose reign were disturbed by contests with his brothers. Early in 1873 the British government succeeded in obtaining from the Russian government a declaration that Afghanistan was beyond the field of Russian influence, and the recognition of the Oxus as the northern frontier of the state. Later, the amir's failure to secure a British guarantee for his sovereignty and family succession, and his refusal to admit British agencies into Afghanistan led to estrangement between him and the British government, and when, in July 1878, he ostentatiously received a Russian mission at Kabul and shortly afterward refused to permit a British mission to cross the frontier, his attitude was regarded as definitely hostile. After some warnings the government of India delivered an ultimatum, his disregard of which led to the decision to invade Afghanistan. In Nov. 1878 the British forces inflicted severe defeats on the Afghan troops and occupied the Khyber pass and the Kurram valley, and early in 1879 occupied Kandahar, Kelat-i-Ghilzai and Girishk. The amir, with the Russian mission, had fled from Kabul, and he died, a fugitive, in March 1879. His second son, Yakub Khan, who was recognized by the people of Kabul as amir, voluntarily visited the British camp at Gandamak in May 1879 and there concluded a treaty, by the terms of which he ceded the Kurram valley, Pishin and Sibi, and the control of the Khyber and Michni passes and of the tribes in their neighbourhood. He also agreed to receive a British resident at Kabul and to subordinate the foreign affairs of Afghanistan to British influence. Major Sir Louis Cavagnari was well received by him as resident, but the amir was either unable or unwilling

to control the fanatical element in Kabul, and in Sept. 1879 the residency was attacked by a mob of townspeople and soldiers, and the resident and his escort were murdered after a gallant defense.

**Abdur Rahman Khan.**—The Kandahar force then concentrated at Kandahar, and a force under General (afterwards Field-Marshal Earl) Roberts advanced through the Kurram valley, defeated an Afghan force at Charasia and occupied Kabul on Oct. 12, 1879. Yakub Khan, having entered the British camp, abdicated, and was sent to India, where he lived for the rest of his life. The British force under Roberts remained at Kabul, and in July 1880 the British government recognized a new amir, Abdur Rahman Khan, a grandson of Dost Mohammed and nephew of Sher Ali.

Sardar Sher Ali Khan, a Barakzai of Kandahar, had already been recognized as independent ruler of that province, but in July 1880 Ayub Khan, a younger brother of Yakub Khan, advanced from Herat, inflicted a crushing defeat on a brigade of British troops at Maiwand and invested Kandahar On Aug. 8 General Roberts left Kabul with a relieving force, which reached Kandahar on Aug. 31, and on Sept. 1 defeated the besiegers and captured their camp, artillery and baggage. Ayub Khan fled with a few followers, and, peace having been restored in southern Afghanistan, the British forces evacuated the country in 1881. Sher Ali was unable to maintain his authority in Kandahar and retired to India, where he ended his days as a pensioner. Ayub Khan again took the field, defeated Abdur Rahman's troops, and occupied Kandahar, but in Sept. 1881 Abdur Rahman utterly defeated him and drove him to seek refuge in Persia. In 1888 he went to India, and lived there as a pensioner of the British government until his death.

Abdur Rahman had been recognized as amir of Kabul only, but within a year of ascending the throne had made himself master of Kandahar and Herat also, and he succeeded in quelling tribal disturbances and in establishing his rule on a firm basis. No attempt was made to fetter his independence except with regard to his foreign relations, which he agreed to conduct subject to the control of the government of India, from whom he received an annual subsidy to be devoted to the payment of his troops and the defense of his northwestern frontier, and considerable supplies of war material, together with facilities for importing arms through India at his own cost.

In 1884 it was agreed that a joint commission of British and Russian officers should demarcate the northern boundary of Afghanistan, but the Russian commissioners did not immediately arrive on the scene, and in March 1885 while the amir was conferring with Lord Dufferin, the viceroy of India, at Rawal Pindi, Russian troops attacked and drove from Panjdeh, a small town on the frontier, an Afghan force. In 1888 the amir's authority was seriously menaced by the revolt of his cousin, Ishak Khan, who held a quasi-independent position as governor of Afghan Turkistan and caused himself to be proclaimed amir, but the rebellion was crushed. Ishak was expelled and settled at Bukhara as a pensioner of the Russian government, and Abdur Rahman's authority was established in the northern province. In 1895 he completely subjugated Kafiristan, a wild mountainous tract to the northeast of Kabul, the inhabitants of which had hitherto successfully resisted all attempts to destroy their independence.

In 1893 encroachments by the amir into the country adjoining the settled districts of India caused the Indian government to negotiate a line of demarcation (known as the Durand line) defining the limits of the amir's authority on his eastern and southern borders.

In 1901 Abdur Rahman died, after a reign of 21 years, in the course of which he gave Afghanistan a government such as it had never known before. This he effected, first, by substituting for a feudal militia under tribal chiefs a standing army, well trained, well armed and regularly paid, owing allegiance to none but himself. By means of this force he was able to establish an efficient central administration, retaining all power in his own hands, and to improve the public revenues not only by increasing the burden of taxation, but by ensuring the collection of all assessed taxes. He was harsh and ruthless, but he relieved his subjects from the petty tyranny of local chieftains, and he suppressed highway robbery and violent crime. It is probable that he fully appreciated the advantages which his country might gain from projects of a commercial or strategical nature, such as railways, telegraphs and mines; but it was his settled conviction that these advantages would be purchased at too high a price by the necessary employment of large numbers of foreigners, whose activities in the country might have amounted to peaceful penetration and menaced Afghan independence

**Habibullah.**—Two days after the death of Abdur Rahman his eldest son was recognized as his successor. Habibullah introduced the reduction of taxation, the establishment of a council of state for tribal affairs and the association of tribal chiefs with provincial governors for the adjudication of tribal cases He also inaugurated military reforms. He loyally observed the condition regarding the control of the foreign affairs of Afghanistan on which the government of India had recognized his father as amir, but on all questions relating to the development of his country's trade and more intimate relations with the government of India he proved to be as wary and suspicious as his father had been. He consented, indeed, to receive a special mission under Sir Louis Dane, foreign secretary to the government of India which reached Kabul in Dec. 1904, but the mission failed to obtain any concessions, and the result of its work was merely the confirmation and ratification of existing agreements and the concession to him in the treaty of the title of "Majesty." After the failure of this mission an endeavour was made to remove his prejudices and to enlarge his mind by arranging for him a visit to India, in the course of which he could meet the leading administrators of the country. His acceptance of the invitation was viewed with disfavour by the more bigoted and ignorant of his subjects, but the manner of his reception by Lord Minto in Jan. 1907, and the good will displayed towards him, undoubtedly did much to improve the relations between the two governments.

By the Anglo-Russian convention signed on Aug. 13, 1907, Great Britain disclaimed any intention of altering the political status of Afghanistan, and Russia declared Afghanistan to be beyond her sphere of influence.

Habibullah, though as suspicious as his father, was more susceptible to modern influences, and among the many mixed blessings of civilization which he introduced into an unappreciative country were motorcars, telephones, newspapers, an hydroelectric scheme and the Habibia college, a high school in Kabul, the staff of which was chiefly composed of teachers from India. Many of these were regarded by the ignorant clerics of Afghanistan as inventions of the devil and the seed of infidelity, and it was partly from a sense of the antagonism which their introduction had aroused and partly with a view to conciliating the hereditary enemies of his house that Habibullah treated with great and unusual leniency the Ghilzais and Mangals of Khost, the district lying immediately to the west of the Kurram valley, who in 1912 had been goaded into rebellion by the rapacity of the local governor.

**World War I.**—On the outbreak of World War I in 1914 the amir declared his intention of abiding by his agreement with the British government and maintaining the neutrality of his country, but the entry of Turkey, the chief Islamic power, whose ruler was regarded by many Moslems as their caliph, encouraged the anti-British party in Afghanistan and induced the amir to receive a German mission, which contrived to reach his western frontier by way of Persia and entered the country as fugitives, having left in the hands of the Russians their confidential papers and that which was most likely to make them welcome in Afghanistan, their gold. They were admitted to Kabul, but their manners and bearing were not calculated to conciliate their hosts. They were regarded as state prisoners rather than as guests, and, in 1916, becoming apprehensive, on misleading information, of the amir's intentions toward them, they retired hastily from Afghanistan, and some of them, falling into the hands of the Russians, were treated as prisoners of war. Habibullah preserved his

neutrality until the end of the war, and would doubtless have received substantial recognition of his loyalty, in most difficult circumstances, to his obligations, had he not been assassinated on Feb. 20, 1919. His brother Nasrullah Khan, caused himself to be proclaimed amir, but after a reign of six days was ousted by his nephew, Amanullah, who was recognized by the nobles and people as king.

**Amanullah.**—The new ruler's position however was not secure and in May 1919 he adopted the expedient of consolidating his power by declaring war on his neighbour, Great Britain, timing his action to coincide with an expected outbreak in India. His information was faulty and his attempted invasion failed After a few weeks of sporadic fighting during which British and Indian forces occupied Dakka beyond the Khyber, and Spin Baldak opposite Chaman, the amir sued for peace which was granted in a treaty signed at Rawal Pindi on Aug. 8, 1919. By the terms of this treaty the amir lost the British subsidy granted to his predecessors, but obtained freedom from control of his relations with foreign states. He had thus secured his main objective, and fortified by the prestige accruing to him as liberator of his country, he lost no time in entering into relations with foreign governments. His envoys signed treaties with Russia (Feb. 1921) and Turkey (March 1921), while a further treaty to regulate his relations with Great Britain was signed in Kabul in Nov. 1921. Treaties with France, Italy, Germany, Iran and several minor European states followed while an envoy was despatched to Washington, D.C , to endeavour to arrange an exchange of diplomatic representation with the United States. A convention with Great Britain arranging for the free import through India of goods as well as munitions followed in June 1923. An exchange of diplomatic representation with Great Britain, Russia, Turkey, Iran, France, Germany and Italy took place, and by the end of 1923 Afghanistan may be fairly said to have joined the comity of nations.

But Amanullah's government did not prosper. The ruler himself was a headstrong reformer, and though a zealous worker he had neither the understanding nor the experience to appreciate the necessity for caution in planning the progress of his backward and fanatical people. His zeal for reforms soon brought him into conflict with his subjects. A rebellion which broke out early in 1924 in the turbulent Southern province and lasted for nearly a year showed up the weakness of his army, exhausted his revenues and severely impaired the stability of the state. Matters went from bad to worse in the years that followed. The king ignored or sent into exile his more sober advisers, neglected his army and made little or no attempt to adjust the economic affairs of his country to the changed conditions of the world in which it now found itself. His attitude toward his immediate neighbours showed that he had little appreciation of his obligations to maintain and foster good relations with the powerful states which surrounded him.

The end came shortly after his return in June 1928 from a prolonged tour of Europe and the near east. Dazzled by his experiences he attempted to emulate the reforms, the success of which he had witnessed in Turkey and Iran. A series of ill-considered measures, which included the education of women, alienated the powerful priestly class, and drove the country to open rebellion. In Jan. 1929 Amanullah was forced to flee the country.

**Habibullah Ghazi.**—The capital, Kabul, where the ill-paid army had little stomach for a fight, fell into the hands of a brigand named Bacha-i-Saqao (son of the water carrier) who took the name of Habibullah. He maintained a precarious hold over Kabul and the surrounding country, and also in Herat and the northern provinces for a matter of nine months, but was defeated and executed by Sirdar Nadir Shah in Oct. 1929.

**Nadir Shah.**—The new ruler who ascended the throne with the title of king (Ala' Hazrat) was a direct descendant of a brother of Amir Dost Mohammed and cousin of Amanullah. He had previously been commander in chief of the Afghan army, but had been in exile in France from 1924. Taking over the reins of government he was faced with a desperate situation. Apart from the few thousand tribesmen who had helped him to defeat Habibullah he had no army, the treasury was empty, Herat had formed a semi-independent administration and the tribes having once tasted of complete freedom were disinclined to submit to authority. He set to work however, ably assisted by his brothers, to bring the country under control, to remake an army and to repair the economic situation. Two serious rebellions were quelled in the first year of his reign, and in the second a formidable brigand chief was driven from the northern provinces. Aided by some timely assistance from the British government he reformed his army, and by 1932 stability was sufficiently restored to enable him to turn his attention to economic reforms. While devoting much of his time to the study of industrial development and financial equilibrium he was yet able to turn his attention to such matters as the improvement of irrigation, and the development of communications. But he had many enemies and his determination to abide by his treaty undertakings with Great Britain undermined his influence with the tribes. The party of ex-King Amanullah was active, and in 1932 a plot to foment rebellion in the Southern province was discovered The rebellion was suppressed and its leaders executed, but a year later in Nov. 1933 King Nadir was assassinated by the son of one of them, a student at the German school in Kabul.

**Zahir Shah.**—The accession of the new king who was the son of Nadir Shah and 19 years of age at the time of his father's death was accomplished without difficulty, chiefly owing to the support afforded him by his uncles, the prime and war ministers After a brief pause while the country recovered from the shock of Nadir's death, the task of prosecuting the plan of reconstruction laid down in the previous reign was resumed. While the greatest care was taken not to incur the charge of unorthodoxy which had caused Amanullah's downfall, the general line of policy provided for the material and moral advancement of the country toward a more civilized way of life. Economic measures took a prominent place. Industrial development was ensured by means of long term credits negotiated chiefly with Germany for the purchase of machinery and the construction of factories. Considerable quantities of munitions were purchased from Europe. Education was developed by the establishment throughout the country of primary schools.

Relations with foreign countries continued satisfactorily, though fear of communist penetration was always latent, and with Britain some friction was manifest over border disturbances, connected particularly with a notorious firebrand, the Faqir of Ipi.

In 1934 Afghanistan joined the League of Nations, and in 1937 close association with Turkey caused her to become a signatory of the Sa'adabad pact. Japan, the United States, Iraq and Egypt established legations in Kabul.

In 1937–38 disturbances among the powerful Ghilzai clan caused some anxiety to the government, but the country as a whole under the wise direction of the prime minister, Sirdar Hashim Khan, was progressing peacefully when in 1939 war broke out in Europe.

**World War II.**—Afghan economic dependence on Germany and her reluctance to be drawn into a distant conflict which did not appear to concern her caused Afghanistan to declare neutrality in Sept. 1939. This policy was rigidly followed till Oct. 1941 when on the advice of Great Britain and Russia the Afghan government decided to remove all Axis nationals, except members of diplomatic missions, from the country. This departure from neutrality which was ratified by the Great Assembly (*Loe Jirga*) was accompanied by a renewed pronouncement of Afghan determination to maintain in future her neutral status. This determination was unchanged at the close of the European phase of the war with the result that Afghanistan was one of the few states to whom invitations were not issued to take part in the international conference to establish a world security organization which opened at San Francisco on April 25, 1945.

**AFGHAN LANGUAGE:** *see* PUSHTU.

**AFGHAN TURKISTAN,** province of Afghanistan, bounded east by Badakshan, north by the Oxus river, northwest and west by Russia and the Hari Rud river, and on the south by the Hindu Kush, the Koh-i-Baba and the northern watershed of the Hari Rud basin. It is 500 mi. long, northeast to southwest, and averages 114 mi. in width between the Russian frontier and the Hindu Kush. The area is about 57,000 sq.mi.—two-ninths of Afghanistan. The population is about 800,000, mainly cultivators in towns and villages, the chief being Mazar-i-Sharif (30,000), the modern supplanter of Balkh. The lowland has much loess and the riverine lands of the Oxus are highly cultivated, but to the west the Turkoman area is waste, and to the south are rough mountains. The people are Persian and Uzbeg with Turkoman, Hazara (Mongol) and Hindu elements. Ancient Balkh or Bactriana belonged to the Achaemenian empire. About 250 B.C. Diodotus (Theodotus), governor under the Seleucidae, made himself independent and founded the Graeco-Bactrian dynasties which succumbed to Parthian and nomad movements about 126 B.C. The succeeding Buddhist era has left us huge sculptures at Bamian and the rock-cut topes of Haibak. Jenghiz Khan laid waste the land; later it belonged for a century to the Delhi empire, then became Uzbeg, and in the 18th century came under Ahmad Khan and his son Timur (Durani Afghans). Next the Khanates fell apart during strife between Timur's sons, and the Uzbeg khans came under the rule of Bokhara. Under Dost Mohammed (1850–1859) the Afghans occupied the province, and boundary disputes were settled (1873) by the Anglo-Russian agreement awarding Andkhui, Shibarghan, Saripul and Maimana to Afghanistan. The Russo-Afghan commission delimited the boundary in 1885.

**AFIUN QARAHISAR** or AFYON KARAHISAR, popular name of Kara-hissar Sahib, the chief town of a vilayet in Asiatic Turkey, nearly 200 mi. east of Smyrna, and 50 mi. south-southeast of Kutaiah. Pop. (1940) 25,897. Called Nicopolis by Leo III after his victory over the Arabs in 740, its name was changed by the Seljuk Turks to Kara-hissar. It stands partly on level ground, partly on a declivity, and above it rises a precipitous trachytic rock (400 ft.) on the summit of which are the ruins of a Byzantine castle. The town is an important centre of trade. Opium in large quantities is produced in its vicinity and forms the staple article of its commerce; and there are, besides, manufactures of black felts, carpets, arms and saddlery. Afiun contains several mosques (one of them a very handsome building). The town is connected by railway with Smyrna, Konia, Angora and Istanbul.

*See* V. Cuinet, *Turquie d'Asie* (Paris, 1894), vol. iv.

**A FORTIORI** (Lat. "from a stronger [reason]"), a term used of an argument in which the conclusion is supported by a ground that is stronger than another that has already been accepted, or is commonly accepted, as sufficient justification for asserting the predicate of the conclusion of that kind of subject. For example, if in a right-angled triangle the side opposite the right angle must be greater than either of the other sides (because the right angle is greater than either of the other angles), "how much more so" (*a fortiori*) must this be the case in an obtuse-angled triangle (which is even greater than a right angle).

**AFRANIUS, LUCIUS,** Roman general, lived in the times of the Sertorian (79–72 B.C.), third Mithridatic (74–61 B.C.) and Civil Wars. In 60 B.C., chiefly by Pompey's support, he was raised to the consulship. In the following year, while governor of Cisalpine Gaul, he obtained a triumph, and on the allotment of Spain to Pompey (55 B.C.), Afranius and M. Petreius were sent to govern it as legates. On the rupture between Caesar and Pompey they were compelled, after a short campaign in which they were at first successful, to surrender to Caesar at Ilerda (49 B.C.), and were dismissed on promising not to serve again in the war. Afranius, however, joined Pompey at Dyrrhachium, and at the battle of Pharsalus (48 B.C.) had charge of Pompey's camp. Despairing of pardon from Caesar, he went to Africa, and was present at the disastrous battle of Thapsus (46 B.C.). He was afterwards taken prisoner and handed over to Caesar, whose veterans put him to death.

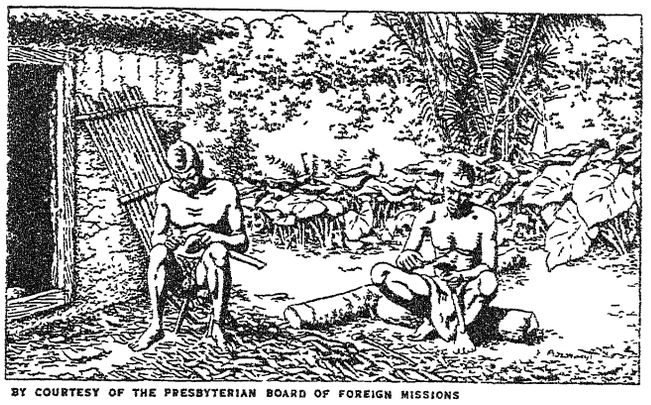
**AFRANIUS, LUCIUS,** Roman comic poet, flourished about 94 B.C. He dealt chiefly with everyday subjects from Roman middle-class life, and tells us that he borrowed freely from Menander and others.

*See* Horace *Epp.* ii. 1.57; Cicero, *Brutus*, 45. *de Fin.* i. 3; Quintilian x. 1. 100; fragments, about 400 lines, in Ribbeck *Scaenicae Romanorum Poesis Fragmenta*, ii. (1898).

**AFRICA,** the name of a continent which is the largest of three great southward projections of the main land-mass of the earth's surface, joined to Asia by the isthmus of Suez, 80m. wide. From its northern extremity, Ras ben Sakka, a little west of Cap Blanc in 37° 21′ N. to the southern, at Cape Agulhas, 34° 51′ 15″ S., it is about 5,000m. long while west to east it is about 4,600m. from Cap Verde, 17° 33′ 22″ W., to Ras Hafun, 51° 27′ 52″ E. Length of coastline is 16,100m. for a mainland area of 11,262,000 square miles.



## GEOGRAPHY

Africa is largely a plateau, broken and elevated in the south and lower towards the north, with fold mountains adhering to the northern flank, and it thus contrasts very strikingly with Euro-Asia in which fold mountains of successive series in diverse stages of denudation occupy a large proportion of the surface. The mean elevation of Africa is about 2,000ft., that of Asia 3,117ft. Asia has much quite low as well as very high land. Africa, as a plateau, has little at either extreme and in particular the land over 10,000-ft. in Africa is merely small groups of peaks.

The high southern part of the plateau reaching north almost to lat. 10° S. has sharp slopes around its edges on the west, south and east, with a narrow coastal plain below, broadening in the north-west and especially the north-east in Angola and Portuguese east Africa respectively. Towards the south this plateau has a high rim, over 6,000ft. above sea near Windhoek in the west and in Basutoland on the south-east. The southern edge is stepped, with the Nieuwveld range above the Great Karroo, the Little Karroo as the step next below and the coastal plain next below that. Within the high rim are considerable areas of centrally placed lower land, the South Kalahari in the south, the depression draining into Lake Ngami (now practically dry) and the Barotse-land depression, but all keep above the 1,500ft. contour and each is a local depression in a table-land most of which is at more than 3,000ft. above the sea. Generally speaking the plateau-edge dips down, with a small coastal ledge, into fairly deep water, but towards the Cape of Good Hope there is a fair area of shallow water off-shore.

The steepness of the edge of the plateau is important as a determinant of the character of the rivers, long sections of which flow in deep slots cut back into the plateau from its edge. The Orange river is fed from the rains that fall on the Drakenberg range and flows west through lands of drought; the Limpopo and Zambezi, the two largest on the east flow out to the broad sandy alluvial flats of Portuguese East Africa and the slot-like character

of a large part of the Zambezi-channel is generally known from the occurrence of the famous Victoria Falls in the south-west the Zambezi system interlaces with that of the Taukhe or Tioghe and receives surplus water from it at times. The rest of the Taukhe water loses itself in the swamps and saltpans of the former Lake Ngami basin. The lower parts of the three great rivers have contributed to the lowering of considerable areas of the plateau below the 3,000ft. level. The Zambezi river, about 2,000m. long, drains an area of half a million square miles, the Orange river, about 1,300m. long and with a drainage area of about 170,000sq.m. but more than that amount must be added if we define the basin orographically and so include in it larger waterless tracts. Towards the north this southern plateau tends to run rather higher and there is a continuous belt of highland across the continent from the coastal plain on the west to Lake Nyasa on the east, in which region the typical form of the southern plateau is interfered with by important rifts to be considered next. Allowing for complexities the southern plateau of Africa is thus essentially an elevated surface with still higher edges for the most part and with, also, considerable depressions, usually desertic in character, near the median north to south axis of the plateau. North of this southern plateau, on the west, is the basin depression, largely floored by younger rocks and now occupied by the Congo and its numerous feeders. The basin is almost enclosed by land over 1,500ft. in height, for the main river escapes through a deep cut between the hills out to sea; there is general agreement that the basin is a depression in the original plateau surface that has been an inland sea. To the east of the basin are series of physical features that together constitute one of the major physical problems of the earth's surface. They are collectively designated the Rift valley system and have been the subject of much discussion, for which reference may be made especially to the files of the Geographical Journal (London, especially 1916–21) and to Krenkel *Geologie Afrikas* (1925). In this region in later tertiary and early Pleistocene times great movements occurred and earthquakes are still a feature. Often a block has sunk between parallel fractures and thence has come the name of Rift valley. A western rift may be traced from Lake Nyasa via Tanganyika and Lake Albert to Gondokoro. Many of the fractures run either north-west to south-east (the so-called "Erythraean" direction) or, in the north, north-east to south-west (the "Somali" direction). A middle rift line goes north-north-east from Nyasa via Lake Naivasha to Lake Rudolf, with branchings and changes *en route;* though its general direction is north to south, its component fractures are generally north-west to south-east and north-east to south-west, with some north to south ones in the north. The easterly rift line is less important and goes on the whole north-eastwards from about the middle of Lake Nyasa. In the floors of the rifts lie the long narrow lakes, Nyasa 1,645ft. above sea-level but with a maximum depth of 2,580ft. so part of its floor is over 900ft. below sea-level, Tanganyika, also very deep and normally 2,624ft. above sea-level but this level is so variable that the outflow from Tanganyika is quite intermittent, and Rudolf at only 1,180ft. Some other lakes are small; that of Naivasha is over 6,100ft.

BY COURTESY OF THE PRESBYTERIAN BOARD OF FOREIGN MISSIONS

NATIVES OF WEST AFRICA ENGAGED IN MAKING SPOONS IN THEIR TRADITIONAL MANNER

Many portions of these lakes have sharp walls and are obviously filling depressed zones. The western rift is the youngest and sharpest; the most important movements may have been as late as the Pleistocene period. The rifts all show volcanic activity which is most marked along the eastern sides of the middle one, where occur the great peaks of Kenya (17,007ft) and Kilimanjaro, on which Kibo peak (19,321ft.) has long been held to be the culmination of Africa but Nilsson (1927) claims to have found points on Kilimanjaro 13ft and 17ft. higher, respectively, than the highest previously known. Ruwenzori, on the eastern side of the western rift is 16,794ft high and has a block structure apparently with faulted sides; interestingly enough it is in about the same latitude as the other great peaks mentioned and they are all on a belt of land, higher than most of the flanking territory, that stretches from the volcanic Cameroons (*v. inf*) to the east coast. This cross-line scheme is noticeable in great basins (Niger, Chad and Bahr-el-Ghazal) to the north-west and is evidently of some importance in the story of the deformations that Africa has undergone.

It seems clear that at Lake Albert there was faulting on a large scale both before and after the country was arched up into a wrinkled dome while, farther east, the middle rift may be connected with faulting near the median axis of a long arch. Faulting of domed and arched structures, supplemented by vulcanicity on a large scale, both occurring so recently as to leave features extremely sharp, are thus the characteristics of the country. Between the arched areas of Lake Albert and the middle rift in a downfold lies Lake Victoria of area approximately 26,000sq.m. and more or less rectangular but fractures determine only a small part of its outline and its shores are not high-cliffed. Unlike the rift lakes, it is less than 50 fathoms deep. It is at 3,720ft. above sea-level.

It is well known that the zone of fractures extends northwards marking the east and west edges of the Abyssinian highland, the series of cliff lines bordering the Gulf of Aden and the Red Sea, and the rift lines along the Gulf of Aqaba to the Dead Sea and the Jordan valley. All through this zone one finds systems of parallel fractures and a considerable number are north-west to south-east, others are north-east to south-west, others apparently north to south.

The relations of land and water, both inland waters and the ocean, have naturally varied a lot with the great changes of land levels, but apparently since present levels were reached, and therefore probably well on in the Pleistocene period, lakes of immense size existed in the rift valleys of East Africa. Shore lines 600ft. above present water-levels have been traced over long distances and there is not much doubt that during the major glacial phases of the Pleistocene ice age in Europe the mountains of East Africa were glaciated much farther down than at present.

The northern extension of the rift system to Lake Rudolf and beyond it north-westwards to the lowlands of the White Nile divides east Africa from Abyssinia and Somaliland. The latter is a plateau sloping south but broken sharply on the north, where a steep slope marks the coast of the Gulf of Aden, and less sharply on the south-east to the Indian Ocean as well as on the south-west towards the Juba river basin which may be described as a widening of the coastal plain. Socotra is essentially a broken off projection of Somaliland. Abyssinia on the other hand is a remarkable mountain land bounded east and west by great fractures of remarkable sharpness giving steep cliffs down to the Red Sea and to the White Nile lowland. The rift system of the Red Sea and that of the Gulf of Aden both enter into relationship with an Abyssinian rift which runs from the sea to Lake Rudolf and divides Abyssinia from Somaliland. Abyssinia differs entirely from any folded mountain range; it is a high and deeply dissected block full of evidences of volcanic activity and provided with powerful rivers, feeders of the White Nile (Sobat, etc.) the Blue Nile and the Atbara, indicating its high (largely summer monsoonal) rainfall. It lies for the most part more than 5,000ft. above sea-level and reaches up to nearly 15,100ft. at Ras Dashan in the north. Lake Tana (Tsana) in the highlands is actually 5,690ft. above sea-level.

The Nile may be said, in a way to begin as the Kagera, the chief feeder of Lake Victoria. It leaves that lake on the north and after passing through the lake swamp of Kioga it goes to the north-eastern end of Lake Albert. Issuing again from the northern end of that lake, it emerges in due course from the rift system into a great flat area less than 1,500ft. above sea-level and framed by higher land save in the north-east and giving so little fall on the river that it becomes obstructed by floating vegetation. It is noteworthy that this upper Nile basin, the Lake Chad basin and the main Niger basin, all more or less enclosed, are nearly in the same latitude, with the still more enclosed basin of the Congo to the south. Basins of this kind are thus a marked feature of the geography of the old block of Africa. After the Nile (Bahr-el-Jebel) has received the Sobat from the east it flows north through increasingly barren country into a slot cut in the great desert. The transition from the fertile slot up the, often steep, slope to the desert plateau is a very sharp one and the river has no tributaries in its desert section. It thence follows that, though the Nile is 4,000 mi. long from the Kagera source to the sea, its basin-area is only 1,107,227 sq.mi., whereas the Congo, rather under 3,000 mi. long but very rich in tributaries, has a basin area of about 1,425,000 square miles.

North of the Congo basin one may go from the Gulf of Guinea across to the extreme east without touching a point less than 1,500ft. above sea. This rise or swell of the land surface has, on its north-west border, the high line (north-east to south-west) of the Cameroons, apparently an old mountain structure rejuvenated by volcanic outpourings. On this line stands the great peak of the Cameroons (13,370ft.) at the corner of the Gulf of Guinea, and it is continued into the sea giving the island of Fernando Po (Spanish) and those of S. Thomé and Principe (Portuguese). On Fernando Po, Clarence Peak is over 9,000ft. high.

North of the Gulf of Guinea the land soon rises above the 600ft. level and towards the west there is a fairly marked slope up from the sea to over 1,500ft. above its level, the slope faces south-west and above it towards the north is a patch above 3,000-ft. in height while one small area near the northeast border of Liberia reaches nearly 10,000ft. This region, with a heavy, monsoonal, summer rainfall is the birthplace of the feeders of the Niger. Thence that river flows north-east demonstrating the general slope of the land down to the Sudan and Sahara, then east and south-east and south to reach the gulf in the lowland between the eastern end of the West African coastal edge and the highland of the Cameroons. Its length is about 2,600m. and basin-area about 800,000 square miles.

Between the main Niger basin and that of the Bahr-el-Ghazal and White Nile lies a basin of internal drainage with the shallow, shrinking Lake Chad in its southern half and a depressed area with some swamps in the north-east. Lake Chad is about 850ft. above sea-level, and receives drainage from the south-east and west. The other depressed area is, in parts, less than 600ft. above sea but the drainage to it is of very small account. North of the Niger and Chad basins is the immense arid belt of the Sahara. It reaches the Atlantic along a low practically waterless coast 1,000m. long from the mouth of the Senegal to the streams of the Atlas. The western part of the Sahara is generally low and has no heights reaching 1,500ft. but in the northern centre is the Ahaggar plateau, connected with the eastern end of which are north-west to south-east lines of higher land one going north-west to the Gulf of Qabes and one south-east crowned by the Tibesti highlands. Eastward, heights diminish again but there is practically a continuous cliff edge along the Nile slot on both sides and the continuation of the desert plateau on the east stands for the most part more than 1,500ft. above sea with a considerable area over the 3,000ft. line.

The desert has large sandy areas especially in the west with regions of stony desert (*hammada*) in the northern centre and a good deal of stony desert to the east. A number of oases break the monotony of the desert, some being north of Lake Chad; some of the land around the Tibesti highland (reaching 8,000ft.) also gets more moisture and has a population aggregated in certain centres. Wadis from the Ahaggar plateau and elsewhere in the desert are interesting evidences of a former greater rainfall and from a study of animal remains as well as of finds of human implements it seems that the Sahara was more or less a grassland during some phases at any rate of the early ages of man. The probability is that periods of greater rainfall in the Sudan more or less coincided with periods of Pleistocene glaciation in Europe The desert area is estimated at 3,500,000 square miles. The Nile slot cuts the desert without modifying it appreciably, and opens out north to the famous delta west of which the coast is not high save in the Barca or Cyrenaica plateau which reaches 1,500ft. not far from the sea.

The Atlas range, the north-western part of the continent, is orographically a part of the mountain arcs that frame the basins of the western Mediterranean. It reaches a height of 14,000ft. at Bu Uriul and Ari Aiaschi and runs, generally, east-north-east to west-south-west. The eastern half has the Tell Atlas on the north and the Sahara Atlas on the south side with the plateau of the Shotts, several lakes without outlets, between them. The western region has the Mid Atlas continuing the first and the Great Atlas continuing the second; the Anti Atlas is parallel to and south of the Great Atlas. To the north of the Mid Atlas the separate coastal mountain range of Er Rif curves north-west to the Strait of Gibraltar beyond which the curved high line is continued in the Sierra Nevada of southern Spain.

South of the eastern ends of these highlands is a more or less east to west line of low land containing the Shott el Jerid (about 52ft. above sea-level) and the Shott Melrir (nearly 100ft. below sea-level) both without outlet. Africa is remarkable for the extent of land, 3,750,000m. in basins of inland drainage.

Africa is singularly poor in islands. Madagascar 229,820sq.m., is one of the large islands of the world (smaller than New Guinea and Borneo); it is separated from Africa by the rather deep Mozambique Channel and in structure it resembles Africa. Biologically it has links both with Africa and with the East Indian archipelago. Socotra, east-north-east of Cape Guardafui, a continuation of the Somaliland plateau is the only other African island of any size. The Canary and Cape Verde archipelagoes of the north-west and the Comoro archipelago of the east are volcanic (but pebbles of continental, or plutonic, material have been sent to Europe from Anjovan, one of the lesser Comoro Islands); the Seychelles are a continental remnant. There are coral islets between the Comoros and the Seychelles. Mauritius, Reunion and Rodriguez, the two last entirely, the first mainly volcanic, lie in the Indian Ocean east of Madagascar; Ascension, St. Helena and Tristan da Cunha in the south Atlantic far to the west. (X.)

## CLIMATE

Extending from latitude 37° N. to 35° S., the greater part of Africa lies within the tropics, and except on mountains and plateaux the average annual temperature is high, ranging from 62° at Cape Town to 86° at Massaua on the Red Sea. On the other hand there are great extremes of rainfall; in the Egyptian desert appreciable falls occur only once in a number of years, while the western slopes of the Cameroon mountains are among the wettest parts of the world, Debundscha at the foot of Cameroon Peak having an average of 369in. a year. Africa may be conveniently divided into five climatic divisions, of which four run roughly parallel with the lines of latitude, while the fifth occupies a large part of the eastern coastal districts. On either side of the equator is a belt of heavy rainfall which is distributed fairly uniformly throughout the year, but with a tendency for April and October to be the wettest months, those following the annual passage of the sun across the equator. This belt roughly coincides with the Congo valley and Gabon. Northwards the first rainy season is retarded into May and June, while the second rainy season is advanced into September and August, giving a long dry season, a principal wet season, a short dry season and a secondary wet season which is not much inferior in intensity to the first. In latitude 8° or 9° N. these two rainy seasons coalesce into one wet season lasting from May or June until September, while the rest of the year is dry; at the same time the total rainfall decreases. North of 15° N. the rainfall is small and irregular and

we pass into the belt of desert which includes the Sahara and Sudan. This extends to the Mediterranean in the north-east, but in the north-west there is a coastal strip in Algeria and Morocco which has a long dry summer but an appreciable winter rainfall and forms part of the Mediterranean climatic province.

In South Africa there is a similar succession, the April rainfall maximum of the equatorial belt advancing into March and February, while the October maximum is retarded into November and December, until the two coalesce into the summer rainfall region of the southern hemisphere, which includes Angola and southern Rhodesia. South of this is the Kalahari desert, the counterpart of the Sahara, while in the extreme south-west is a small area round Cape Town with a dry summer but appreciable rainfall in winter (April to September). This zonal division does not apply to eastern Africa south of the equator, which has summer monsoon rains and a winter dry season over its whole extent.

BY COURTESY OF THE AMERICAN BOARD OF FOREIGN MISSIONS

A RAIN-MAKER, AN IMPORTANT MEMBER OF WEST AFRICAN COMMUNITIES, WITH THE REQUISITES OF HIS MAGIC

**The Equatorial Rainfall Belt.**—This region includes the greater part of the Congo basin above Leopoldville, Gabon, Cameroon and the coast of Nigeria as far as the mouth of the Niger. Its characteristics are uniformly high temperature and humidity, a large amount of cloud and a rainfall generally exceeding 60in. a year and rarely falling below 2in. in any month. The temperature is rarely extreme, and probably many parts of the region have never reached the Greenwich maximum of 100°, but on the other hand the temperature rarely falls below 60° on the low ground. The annual average may be taken as 80°, rising to 87° during the day and falling to 73° at night. The hottest months generally fall in the early part of the year, while July and August tend to be coolest, but the annual range is rarely as much as 10°. The relative humidity averages 80%, and this continual moist heat is very enervating to Europeans. The greater part of the region is densely forested.

**Savanna Belts.**—North and south of the equatorial rain forest is a zone of moderate rainfall, the whole of which falls in a short summer rainy season, while the remainder of the year is dry. These belts may be regarded as extending as far as the isohyet of 20 inches. The northern belt includes Senegal, Bathurst, Sierra Leone, the Gold Coast, Dahomey, the greater part of Nigeria, the Sudan and Abyssinia. The rainfall varies greatly, rising to as much as 154in. a year at Sierra Leone, but even there the months of December to March are almost rainless. The drier parts are occupied by open grass-land but the wetter areas are forested. The rainy season from May or June to September inclusive, in spite of being summer in the astronomical sense, is the coolest part of the year, the temperature being kept down by the great cloudiness and heavy rainfall. This season is unpleasant because of the high humidity, the small daily range of temperature and the frequent thunderstorms and tornadoes, especially at the beginning and end of the season. The prevailing wind is south-westerly at the surface, but is very light; at a height of a few thousand feet the wind becomes north-easterly, and the thunderstorms advance from the north-east. From late October until the end of February is the most pleasant season, with hot days but cool nights, dry air and clear skies; the prevailing wind is north-easterly except on the coast, where sea-breezes occur during the day. Over the interior the wind is often laden with penetrating fine dust (Harmattan wind). In March, April and the beginning of May, the temperature is very high, maxima sometimes exceeding 100° even on the coast, and reaching 110° in the interior. The humidity of the air is still low but is rising steadily, and the wind is light and variable. The rainfall of the Abyssinian plateau is of great importance as the source of the annual Nile floods, and so of the fertility of Egypt. The annual rainfall of Addis Ababa averages 50in., but more than three-fifths of this amount falls in July, August and September, while October to January inclusive are almost rainless. In spite of the position of Abyssinia near the eastern margin of Africa, it is believed that most of the moisture which falls as rain is derived from the Atlantic ocean, and is carried across the whole width of the continent by the south-west winds, and that only a comparatively small part of the rainfall is derived from the Indian Ocean. The southern savanna belt includes Angola and Rhodesia; the climate is generally similar to that of the northern belt, but the summer rainy season occurs from December to February The rainfall nowhere exceeds 60in. and owing to the generally high elevation the climate is comparatively pleasant and healthy The amount of cloud is comparatively small, and the lowest temperatures occur in winter and not, as in the north, in the rainy season.

**Deserts.**—The greater part of Africa north of 16° N. is occupied by an arid climate which gives rise to the deserts of the Sahara and Egypt. The rainfall is less than 10in. a year, and over a large part of the area is probably less than an inch, being confined to a few drops once or twice a year and isolated heavy falls at intervals of many years; under these conditions the term "average" has no meaning The temperature is very high in summer, the average in July exceeding 90° over a large part of the interior; it remains very hot from April to September inclusive, but the winter months are relatively cool. The daily range of temperature is very great, exceeding 30° at many places; for example at El Obeid in the Anglo-Egyptian Sudan in January the mean daily maximum is 86° and the mean daily minimum 52°, and frosts are occasionally experienced. Very high maxima are recorded in summer, exceeding 110° on the coast and 120° in the interior, while at Azizia, in Tripoli, a shade temperature of 136° has been recorded, the highest known on the earth's surface. The air over the interior is dry, less than 40% average humidity for the year, and figures of 2 or 3% have been recorded. On the coast special conditions prevail, which will be referred to later. The amount of cloud is very small, generally less than one-fifth of the sky covered, while in parts of the Egyptian desert no cloud is seen for months together. The winds are generally light and irregular over the Sahara, but dust storms, sand pillars and other local violent winds occur. In the Nile valley the prevailing wind is southerly from November to February and northerly from April to September and reaches considerable strength in the midsummer months, greatly moderating the temperature; occasional very hot, dry, dust-laden southerly winds are known as the Khamsin; these are very unpleasant, especially when accompanied by sand storms Similar winds from the desert occur also under local names in Tripoli, Tunis and Algeria; they frequently cross the Mediterranean to southern Italy as the scirocco. A severe form is the dreaded simoom or samun, a hot blast of air (125° or more), often accompanied by heavy clouds of dust or sand. Land and sea breezes are well developed on the coast of Tripoli, Tunis and Algeria, but not of Egypt. The corresponding desert of southern Africa, the Kalahari, is of much less extent, being limited to the western half of the continent, and the heat and dryness are not so excessive as in the Sahara.

The climate of the coast of the Red Sea and Gulf of Aden is peculiar. The rainfall is exceedingly scanty, the sky almost cloudless, and the temperature very high, but this is associated with an abnormally high humidity, the moisture being derived from the warm waters of the Red Sea, which reach 90°. The highest known temperature of the wet-bulb thermometer, 100°, has occurred at Kamaran island and Berbera; this moist heat is very unpleasant. Where the Sahara and Kalahari meet the Atlantic, different conditions occur; here the presence of cold currents makes the surface of the sea very cold, while the land a few miles inland is very hot; these regions have a very small rainfall, clear skies but frequent fogs over the sea, and a moderate temperature which changes very little throughout the year. The rainfall of the South African west coast from 17 to 28° S. is less than an inch a year.

**Mediterranean Climate.**—Morocco, northern Algeria and northern Tunis have pleasantly mild, rather rainy winters and

long, hot, dry, almost cloudless summers. The annual rainfall averages about 30in., but is very variable. The mean temperature is between 50° and 60° in January and about 80° in July and August; the daily range is about 15°. A similar climate is found over a small area near Cape Town, which has a temperature ranging from 55° in July to 70° in January and February, and a rainfall of 25in. falling mainly from May to September inclusive.

**Eastern Africa.**—Kenya Colony, Tanganyika, Uganda, Nyasaland and Portuguese East Africa have an equable climate with a temperature between 75° and 80° near sea-level and a rainfall of 30 to 60 inches. There is generally a fairly well-marked rainy season; near the equator this occurs in April and May with a minor rainy season in November and December, but further south there is only one rainy season, falling in summer. Thus at Zanzibar the rainiest months are April, May and November, in that order, and at Nairobi, April, November and May, but at Lourenço Marques in 26° S., January and February. The dry season or seasons are not so extreme as in West Africa; months entirely without rain are rare and the relative humidity remains fairly high throughout the year. The prevailing winds are easterly. Thunderstorms are very frequent during the rainy season, recurring with great regularity almost every afternoon. The low-lying coastal areas are enervating and in places unhealthy, but large parts of the interior, including the whole of Uganda, form plateaux with an elevation of several thousand feet, and as the average temperature decreases upwards at a rate of about 3° per 1,000ft., these uplands are much cooler and more bracing than the coastal regions, while their distance from the sea makes them somewhat drier except on slopes directly exposed to the rain-bearing easterly winds. These plateaux are rather more suitable for European habitation than the coastal areas. Natal and the eastern parts of the Cape Province have warm, rainy summers, with a temperature of 70° to 75°, and moderately cool winters, relatively dry but very seldom rainless. The annual rainfall is between 30 and 40in.; the average July temperature is 63° at Durban and 59° at East London, but over the high ground of the interior frosts are sometimes experienced in winter. This is one of the finest and healthiest climates in Africa. (C. E. P. B.)

## FAUNA

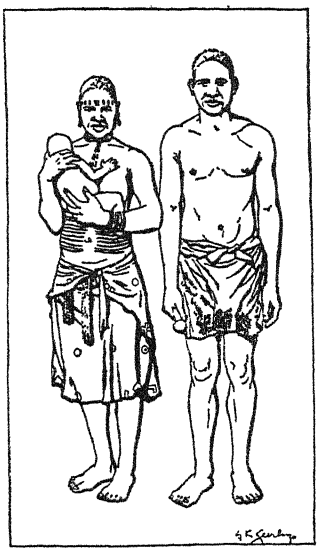
Africa, together with the Deccan and West Australia as well as Brazil, forms part of the old continental mass of Gondwanaland, whatever view one may take of the process of separation of each from the others. Gondwanaland seems to have persisted through much of the Mesozoic era, during which these southern lands were separated from the northern ones by the broad sea of Tethys, along which later uprose the great fold mountain ranges that stretch from the Pyrenees to the Malay. The southern lands thus show resemblances in their forms of life that are due to these old links. Another factor of the history of life within them is the stability of their conditions as contrasted with the wide variations that have occurred in the orography and climate of the northern lands. Those wide variations have been reflected in evolutionary changes among living things and thus the northern lands have become in a large measure the homes where new forms are born, while the southern ones are largely refugees of early strays from the north, or places where certain types immigrating since connections were made have had a great career. The Sahara desert-barrier is largely a modern (post-glacial) hindrance to immigration of animals, the Rift system a partial but serious hindrance also relatively recently established.

The isolation of Africa is far less than that of Australia, and, whereas Australia retains the two lowly egg-laying mammals (*Ornithorhynchus* and *Echidna*) and is the great home of the marsupials, and of no other truly native mammals save bats, an indication of its long separation, Africa retains neither the egg-laying mammals nor the marsupials. The lowliest order of truly placental mammals, the so called Edentata, absent from Australia, occurs in South America, Africa and south-east Asia. Its great home is South America, but the aardvark (Cape ant-eater) is peculiar to Africa and *Manis* (the scaly ant-eater) has species both in Africa and in south-east Asia. It is an interesting fact that the order, though an ancient one is absent from Madagascar. The primates offer a contrasted distribution. Among them the lemurs are ancient forms of known fossil from the northern lands but now surviving in Africa, Madagascar and south-east Asia; Africa has many more forms than south-east Asia and Madagascar many more still. From the lemurs have descended monkeys and apes; the platyrrhine monkeys are American, the catarrhine, African and Asiatic, including, among anthropoid apes, the orang-utan and the gibbon of south-east Asia and the gorilla and chimpanzee of intertropical Africa. It is generally thought that the survival of lemurs in Madagascar is a result of its separation from Africa before the great carnivores had spread thither. The absence of elephants, rhinoceros and anthropoid apes from Madagascar is noteworthy. The most important African carnivore is the lion, also found in parts of Arabia, Persia and western India and formerly more generally distributed in south-west Asia and north-east Africa until man restricted its range. The leopard (panther) and hyena are the other large carnivores. Madagascar has very primitive carnivores only, one of which was formerly said to be closely related to a West Indian form though the resemblances seem better interpreted by the fact that both are ancient types. The African elephant is a species distinct from the Indian one; the distribution of the genus was of course far wider until postglacial times. The hoofed animals of Africa are of some interest. Of even-toed forms Africa alone preserves the hippopotamus which ranged widely in northern lands until a late phase of the ice age; remains of a small hippopotamus species have been found in Madagascar which also possesses a river hog (*Potamochaeros*). It is thought that they may have swum across from Africa before the separation between continent and island became very marked. The giraffe and okapi are another family of hoofed animals found in East Africa only. The rhinoceros has east African and south-east Asiatic species. The single humped camel is now a feature of the steppes and deserts of north Africa but only as a domesticated animal introduced from Arabia. Deer are absent from Africa save for a few forms in French Africa, north of the Sahara, just as bears and wolves do not occur south of the desert. On the other hand the immense warm African grasslands are overrun by many antelopes, and the zebra and formerly the quagga. Africa thus, along with a number of old fashioned forms has several relatively new fashioned ones, but the absence of true cattle, pigs, goats, sheep and camels until man brought them is a striking fact. Of the genus *Bos*, nevertheless, South Africa possesses a representative in the Cape buffalo (*Bos caffer*). Africa has many birds peculiar to it but we need only notice the ostrich family of birds that run over grassland and desert border; extinct running birds of great size (*Aepyornis*) lived in Madagascar apparently not very long ago. Some African reptiles (*e.g. Amphisbaena*) appear closely related to South American forms, others to those of northern lands, the abundance of crocodiles is a feature and so are the chameleons, which especially abound in Madagascar. The python and puffadder are notable among African snakes. Monitor lizards, abundant in Africa and elsewhere, have not reached Madagascar. The Amphibians of Madagascar include several species also found in south-east Asia and this may be a result of an ancient land connection, and analogous arguments could be given concerning the land snails. Africa has the disastrous fate of being the one home of the tse-tse fly. (X.)

## FLORA

The character of the vegetation of Africa is largely determined by the distribution of heat and moisture coupled with the great range in altitude. Phytogeographically the continent may be primarily divided into three sections: (1) a northern extratropical region, bordering the southern shores of the Mediterranean and gradually fading into the northern Sahara desert with a very scanty flora; (2) a tropical African region, bounded approximately on the north by the Tropic of Cancer; and (3) a South African region, reaching as far north as the Limpopo, Lake Ngami and southern Angola. According to Thonner (*Fl. Pl. of Africa*, 1913), there are in Africa about 3,712 genera and over 40,000 species of flowering plants, a number constantly being added to.

**The Northern Area.**—The northern area contains a considerable proportion of genera and species common to the south of Europe, besides a large number of endemics in and south of the Atlas mountains and in Morocco. In the Atlas mountains the Atlantic cedar (*Cedrus atlantica*) is a characteristic tree, and is very closely related to species in Asia Minor and the western Himalayas, some authorities having considered them all to be forms of one variable species. The flora of Morocco is related to that of the Canary islands, whilst the somewhat meagre indigenous vegetation of Egypt is largely the same as that of Palestine and Persia.



The tropical African flora may be roughly divided into four regions: (1) a northern desert or semi-desert region; (2) a savannah region; (3) a high mountain region; and (4) the tropical rain forest. The first type is characterized by a very scanty rainfall, and its flora consists largely of plants which are short-lived, such as annuals, or those specially adapted to resist long periods of drought. These include the date-palm (*Phoenix dactylifera*) which grows where other vegetation is practically non-existent. The transition from the semi-desert to that of the savannah is usually gradual with an increase in annual rainfall and pronounced wet and dry seasons. In the savannah the low, thorny bushes of the desert are replaced by scattered trees and shrubs, giving the country a park-like appearance, with an undergrowth of grasses and herbaceous flowering plants, including numerous annuals and species with underground root-stocks. This vegetation is typical of the elevated plateau-region which occupies a large portion of the continent. Characteristic trees are the baobab (*Adansonia digitata*), the shea butter tree (*Butyrospermum Parkii*), *Anogeissus Schimperi, Afzelia africana, Entada sudanica, Parkia filicoidea,* the fan-palm (*Borassus flabellifer*), etc.

In general it may be stated that the desert type is steadily encroaching on the savannah, which in turn is gradually penetrating the northern limits of the forest region, a [illegible] resulting from a combination of desiccating winds during the prolonged dry period and of human agency (shifting cultivation and burning of the grass). In the drier parts of the savannah, for example in the eastern Sudan, large areas are covered by species of thorny acacia, including *A. arabica,* producing gum-arabic. In somewhat less arid but similar country farther south, in Rhodesia, south-east Belgian Congo and parts of Angola, another leguminous genus, *Bracnystegia,* is very plentiful, and forms almost pure low forest, whilst in the drier semi-desert areas of south Angola and Damaraland a unique example of the vegetable kingdom, *Welwitschia mirabilis,* is found. In the savannah and neighbouring forest regions there are numerous plants with edible fruits and not a few poisonous plants such as species of Dichapetalum (*Chailletiaceae*), the arrow-poison (*Akokanthera*), *Lasiosiphon Kraussianus, Strophanthus,* etc.

The high mountains capping the savannah region, such as the Cameroon mountains, Mt. Elgon, Mt. Kenya, Mt. Ruwenzori, Mt. Kilimanjaro, etc., carry a flora of great interest. On one or other of these mountains it is possible to traverse almost as varied a succession of types of vegetation as might be encountered in a journey from the equator to the vicinity of either of the poles. Many of the genera found on their slopes are represented elsewhere only in the temperate regions of the northern or southern hemispheres. Some of the better known examples are berberis, cornus and anemone, whilst outliers from the Cape region occur, such as *Protea.* The weird forests of tree-groundsels (*Senecio*) and the giant species of lobelia are characteristic features of the East African mountains.

The evergreen forest occupies mainly the low-lying country with a high rainfall distributed throughout the year, and extends in an ever-widening belt from the colony of Sierra Leone to the Cameroons, whence it spreads out over a great part of the Belgian Congo and the Gabun as far as the Victoria Nyanza. This forest sometimes penetrates for a considerable distance into the savannah regions along the banks of rivers. It is particularly rich in endemic species of trees, shrubs and woody climbers, some of which are of great commercial value. The most important timber trees are the African mahoganies (*Khaya, Pseudocedrela, Entandrophragma,* etc.) and numerous trees of the families Caesalpiniaceae, Combretaceae, Simarubaceae and Euphorbiaceae. Amongst ornamental shrubs the numerous species of Mussaenda (Rubiaceae), with enlarged, brightly coloured calyx-lobes, and the brilliant-flowered combretums, are conspicuous The silk-cotton or kapok tree (*Ceiba pentandra*), with its enormous buttressed trunk, often attains gigantic proportions, whilst in West Africa especially the valuable oil-palm (*Elaeis guineensis*) is abundant. As many of the peculiar genera found in this primaeval forest, especially in the Cameroons and Gabun regions, are also found in the Guianas and Brazil on the opposite side of the Atlantic, it seems probable that it is but the remains of a once much more extensive and continuous tract of forest. Apart from Madagascar, the connection between the East African forests and those of tropical Asia is not nearly so marked.

**South African Flora.**—The South African flora, broadly speaking, consists of two main types: the typical Cape or south-western region occupies a narrow strip within the southern coast line In some respects it resembles certain features of the Australian flora, the peculiar families Proteaceae and Restionaceae and certain groups of Leguminosae being common to the two areas and rare in other parts of the world. The vegetation of this coastal area is of a marked xerophilous character and bears a superficial resemblance to that of certain parts of the Mediterranean. It is of the so-called bushwood type, and here and there are tracts of grassland. Intermingled with the shrubs are numerous annuals, herbaceous perennials, succulents, etc Farther inland, between the ranges of mountains, much of the surface is occupied by the "rhenosterbosch," *Elytropappus rhinocerotis* (Compositae). True forests occur only towards the eastern part of the region, in the districts of Knysna and Humansdorp, and the trees composing them nearly all belong to tropical genera. In the north-west a few trees of a conifer, *Callitris juniperoides,* are found, being the sole remains of a once extensive forest. The silver-tree, *Leucadendron argenteum,* is now confined to the Cape peninsula, which harbours as many as a hundred species of Erica. Other striking plants in the same district are the brilliant scarlet *Disa uniflora* and the blue *D. graminifolia,* two beautiful ground orchids. There are also numerous species of the geranium family and many beautiful oxalis, large numbers of which are in cultivation.

A FAMILY OF MAKALANGA NATIVES
The Makalangas are a branch of the Bantu race of southern Africa—an agricultural people and more civilized than the tribes of the interior

Of the remainder of the South African regions perhaps the most interesting and remarkable is the Karroo, which occupies a broad belt in the hinterland of the south-western coast region. It is mainly a vast shallow basin which in former times was the bed of a large lake. Its altitude, according to Bolus, ranges from 1,800–2,500ft., the mountains on the northern margin reaching 8,000ft. altitude. The vegetation is of an intensely xerophytic type, being composed mainly of succulents of weird and diverse form, thornbushes and numerous plants with bulbous and tuberous root-stocks. Trees are almost entirely absent. The predominant families in this region are Compositae, Leguminosae and Ficoidaceae, the last-mentioned being almost entirely represented by about 70 species of the genus *Mesembryanthemum* and its segregates. In this area the exotic *Opuntia* from Central America has become a pest.

The upper and Kalahari regions distinguished by Bolus may for convenience be treated as one. Whilst the families mentioned above are still highly represented, the grass family, Gramineae, takes a very high place, much of the country being grassland (high veld). Here also there is a considerable influx of families and

genera characteristic of the tropical regions to the north. Amongst the Compositae the everlastings (Helichrysum) are conspicuous.

The south-eastern coast region is bounded on the south-west by the Van Stadens mountains and extends northwards east of the Drakenberg as far as the tropic into which it gradually merges. It is essentially a southerly extension of the tropical flora of East Africa, and contains a large number of such tropical families as Asclepiadaceae, Acanthaceae, Rubiaceae, etc. True rain-forest occurs in Natal. The plants so characteristic of the south-western coast region diminish rapidly northward Some of the most striking plants in the area are a large tree-euphorbia (*E. grandidens*) and several species of Eucephalartos (Cycadaceae) and numerous species of aloe. Although nearly opposite the island of Madagascar, there is scarcely anything in common between the two floras.

As in the case of the tropical flora, it seems clear, judging by the history of the vegetation, that the climate of South Africa is gradually becoming drier. (J. Hu.)

## GEOLOGY

Africa has a simpler geological structure than any other continent, although it has many unique features and formations. It consists essentially of a plateau of which the rocks have not been bent into steep folds by compression since primaeval times, except for a strip in Cape Colony, which was part of an ancient southern continent, and for the Atlas Mountains, which are geologically and biologically European. The continent between these remote chains of fold mountains has undergone no close folding, and most of it has remained above sea level since the time of the oldest known fossils. The margins have been repeatedly reached by the sea, which has submerged the coastal plains and occasionally extended inland up the valleys. The plateau has been fractured and cleft by earth movements which occasioned widespread volcanic eruptions; but the plateau surface has remained a land area on which plants and animals have evolved continuously, subject to the stimulus of changing climate, but never interrupted by submergence. Africa is part of an ancient continent which included most of South America, India and Australia. This southern continent, Gondwanaland, was separated from the contemporary northern land of Eurasia, except for an occasional isthmus, by a sea, the Tethys, which extended from central America through the Mediterranean and across southern Asia to the Eastern Archipelago. The range of this southern continent is best established in Carboniferous times; by the Jurassic its disruption had begun by subsidences which formed the Atlantic and Indian oceans, introduced great changes in its biological relations, and repeatedly caused widespread volcanic eruptions.

The foundation of the continent consists of a vast slab of rocks belonging to the Primaeval or Pampalaeozoic era. They are exposed over about one-third of the continent. They outcrop from Cape Town to southern Egypt, and from the Gold Coast on the west to Somaliland, the eastern horn of Africa. Most progress in the classification of these rocks has been made in South Africa, where they have great mineral wealth. They are divided into three main divisions. The lowest, the Swaziland system, consists of gneisses and coarse schists; in addition to the typical areas in South Africa, it forms most of Africa, including Nubia, the highlands along the eastern and Atlantic coasts, and the Sudan from Abyssinia to Nigeria and the Gold Coast. This division corresponds to the old gneiss of other lands, such as the Laurentian of Canada and the Lewisian of Britain.

The second division consists of sedimentary rocks, including quartzites, limestones, dolomites and slaty schists, with vast sheets of volcanic rocks. They are classified in South Africa as the Witwatersrand, Ventersdorp and Transvaal systems. Some of the rocks are so little altered that they have been expected to yield fossils; but none has been found and the *Orthoceras*, said to prove the Ordovician age of the Otavi dolomite, was based on cylindrical concretions. Some of these beds were regarded as Lower Palaeozoic; but they are probably earlier owing to the absence of fossils, and their resemblance to the pre-Cambrian rocks of other continents. The representatives of this division include important copper, lead and zinc mining fields in northern Rhodesia and the Congo basin, the goldfield of Kilo in the eastern Belgian Congo, the goldfields of the Gold Coast Colony and the less important gold occurrences that have been discovered in Tanganyika Territory and Kenya Colony.

The third division includes sandstones that are so little altered that they have been persistently regarded as the inland continuation of the Devonian red sandstones of the coast at Cape Town. The chief member is the Waterberg sandstone of the northern Transvaal, which is probably represented in Uganda by part of the Karagwe series (most of which is referable to the second division), and in Angola by the Oendolongo series. These sandstones are probably the equivalent of the Torridonian of Britain and the Keweenawan of the United States and Canada.

The Palaeozoic era began with apparently the whole of Africa as part of a continent, for the only Cambrian beds known in it are in Morocco near Tetuan, though the sea came close to the eastern coast in Sinai. No certain Ordovician rocks are known, though they have been doubtfully recorded from the Atlas mountains. Many beds in Africa have been called Ordovician and Silurian on inadequate evidence, but some Silurian beds with graptolites occur in the central Sahara.

The Devonian is the oldest African system with widespread fossiliferous beds. It includes the Bokkeveld beds in Cape Colony, and has a wide extent in the Sahara, Libya and the western Sudan, and it reaches the Atlantic on the Gold Coast; marine representatives occur of the lower, middle and upper divisions. Marine Carboniferous rocks occur to the north of the Devonian beds in Cape Colony and limestones with crinoids and *Productus* show that a contemporary sea covered part of Egypt. The Lower and Middle Carboniferous are widely developed in the northern and north-western Sahara, and in south-western Tripoli; and there are small outcrops by the Gulf of Suez. The Carboniferous land deposits are extensive. The lowest part of the Karroo system of southern Africa is Upper Carboniferous and includes the glacial Dwyka Conglomerate and rich coal seams. Coal is also found in southern Rhodesia, Tanganyika Territory and Lake Nyasa. The glacial deposits of this period extend northward into the Congo basin and southern Madagascar. The later divisions of the Karroo system range from the Permian to the Lower Lias and are represented in equatorial Africa; they have yielded many remarkable fossil reptiles. The Permian beds (Lower Beaufort) are represented by shales of freshwater origin with *Palaeanodonta* on the Sabaki in Kenya Colony, and the Trias (Upper Beaufort) by the Tanga beds and part of the Buruma sandstone, of which the fossil *Dadoxylon* forest may be the equivalent of that of the Molteno beds of South Africa. In the Congo there are large areas of sandstones, the Lualaba and Lubilache series, which, judging from their sparse fossils, are Permian and Trias.

There is no established marine Trias in Africa, except for a small development in southern Tunis and along the Atlas of beds like those in Andalusia; though the sea lay a little north in the Mediterranean, most of the Triassic beds of Algeria and Tunis are of the continental type, like those of England and Germany. The breaking up of Gondwanaland had nevertheless probably begun in the Trias, and in the next period, the Jurassic, marine beds were deposited along parts of the east African coast. An arm of the sea then ran up the Mozambique channel between Madagascar and the mainland. The eastern part of Madagascar consists of the primaeval gneisses and schists, on which rest some Karroo beds; the western slope consists of marine Jurassic, Cretaceous and Kainozoic beds, with some volcanic rocks. The Jurassic beds of Madagascar and Tanganyika Territory range from the Lias to the end of the system; further north, in Kenya Colony and Somaliland, the horizons established represent from the Bathonian to the Tithonian. In Tanganyika Territory the Upper Jurassic beds (Corallian to Tithonian) in Tenduguru are famous for their fossil reptiles, of which *Gigantosaurus* is the largest known animal.

The advance of the sea during the Jurassic received in East Africa a check in the Cretaceous; for though a Neocomian gulf ran northward from Uitenhage in Cape Colony past Madagascar, the lowest Cretaceous series is barely represented in Kenya and

its occurrence in Abyssinia is probably due to a gulf from the Mediterranean The widespread Cretaceous rock of eastern Africa is the Nubian sandstone (possibly partly Upper Jurassic), a land deposit which extends from Egypt to Abyssinia and Somaliland In Egypt an arm of the Mediterranean sea deposited Cretaceous beds, which represent all the series from the Lower Cenomanian to the Danian.

A Cretaceous strait in the Upper Albian and Senonian extended from the Mediterranean across the Sahara, past Lake Chad and along the Benue valley as far south as Angola. The Cretaceous in Africa is best represented in Tunis, Algeria and Morocco At the beginning of the period the sea covered a narrow strip of land from the coast to just south of Tunis and Oran; but by the Middle and Upper Cretaceous compact limestones were deposited over much of northern Algeria, and the Cenomanian lagoons lay along the front of the Sahara

In the same region the Cretaceous sea was succeeded directly by that of the Lower Eocene, wherein were deposited the phosphatic limestones that are the most valuable mineral deposit of northern Africa. A still wider submergence in the Middle Eocene formed the Nummulitic limestone, which ranges across northern Africa from Cairo through Cyrenaica and along the Atlas Mountains to Morocco; and a gulf southward extended on to some of the lower parts of the Sahara. A strait from this gulf continued to the Niger valley and covered the district of Sokoto, and reached the Gulf of Guinea in southern Nigeria and the Cameroons. The Oligocene saw a general retreat of the sea from northern Africa, but beds with small Nummulites were deposited in bays. The freshwater lakes of the Oligocene have yielded at Fayum the fossils which revealed to C. W. Andrews the story of the origin of the elephants from the primitive *Moeritherium*.

The Miocene sea along the Atlas was restricted to a strait from Oran to central Tunis, which was one of the passages that connected the Atlantic and the western Mediterranean. A renewed uplift at the end of the Miocene of the channel reduced these straits, though that south of the Riff in Morocco was apparently still occupied by the sea. In other parts of Africa the marine Cainozoic deposits are scanty. The sea occasionally reached the tropical coasts. A full series of Eocene limestones occur in Somaliland, with also the Upper Oligocene. Eocene and Miocene deposits occur both on the coasts of Kenya Colony and in Tanganyika Territory at Lindi; Miocene limestone occurs in the island of Pemba. The marine Pliocene of the Mediterranean is represented in Algeria and Egypt, while marine Pliocene deposits allied to those of the Persian Gulf also occur, notably in Zanzibar island and at Mombasa.

Africa, therefore, has a long stable development, which was occasionally interrupted by volcanic outbreaks connected with the fractures made by the foundering of the adjacent ocean basins. The eastern half of Africa appears to have been slowly upraised during the Mesozoic into a broad, flat arch contemporary with the formation of a great sea-filled trough along the East African coast. The wider subsidence that formed the Indian Ocean led to the giving way of the eastern side of the arch, and the infall of its roof formed the Great Rift valley, which extends from Mozambique throughout eastern Africa and along the Red Sea to the Jordan valley. The fractures connected with its formation were accompanied by great volcanic eruptions, and the Kapitan phonolites of Kenya Colony are probably contemporary with the Deccan traps of north-western India. The earth movements connected with the formation of the Great Rift valley lasted from the Oligocene to the Pleistocene, and they were accompanied by repeated volcanic eruptions. They built up the two highest of African mountains—Kilima Njaro, which still has a crater upon its summit, and Kenya, which is the denuded neck of an old volcano. Subsidences around volcanic centres formed great cauldrons, such as Ngorongoro in Tanganyika and Menengai in Kenya Colony. Volcanoes along the fractures connected with the formation of the Atlantic produced the shonkinite vent at Chiluca in Angola, the volcano of the Cameroons, which is still active, while eruptions along a fracture parallel to the coast formed the islands of the Guinea Gulf, Fernando Po, San Thomé, Principé and Annobon The deepest subsidences along the Rift valley in Africa formed the lake basins of Tanganyika, Nyassa, the Albert Nyanza and Lake Rudolf.

The economic geology of Africa is connected mainly with its rich mineral fields, especially of gold and diamonds in South Africa, southern Rhodesia and the Gold Coast; of gold at Kilo, of diamonds, copper, zinc and lead in Northen Rhodesia and Katanga Tin and platinum are found in the Transvaal, and chromium in southern Rhodesia The most important phosphate deposits are along the Atlas Mountains The only [illegible] African oil-field is on the coast of the Gulf of Suez, oil-shale is known in South Africa, Nigeria and elsewhere; rich coal-fields are worked in the Transvaal, Natal and Southern Rhodesia; and coal also occurs in Tanganyika Territory, Nyassaland and Nigeria. Iron ores are widespread, as are also deposits of bauxite and manganese, which are most extensively worked on the Gold Coast. The chief African mica mines are in Tanganyika Territory.

## TABLE OF FORMATIONS

| | | |
|---|---|---|
| | | CAINOZOIC |
| | *Pleistocene.* | Raised coral reefs. Alluvial river and lake plains. Moraines on Kilima Njaro, Kenya, and Ruwenzori. Elephant beds in Zululand Lavas and tuffs of recent volcanoes. Gravels, desert sands, etc., with Neolithic and Palaeolithic implements. |
| | *Pliocene.* | Marine beds in Tunis and Algeria. Sands with *Clypeaster* in Egypt. Limestones of Zanzibar, Pemba and Mombasa. Naivashan lavas in Kenya. Bone beds at Homa, Omo Valley, etc. Lavas in Atlantic islands, Aden, etc. |
| | *Miocene.* | Marine limestones in Algeria and Tunis. Limestones of Pemba and Tanganyika coast. *Dinotherium* beds of Victoria Nyanza. Limestones of Egypt with oil-field of Gulf of Suez. |
| | *Oligocene.* | In former bays along Mediterranean coastlands. Dubar limestone of Somaliland. Limestones N. of Mombasa and at Lindi. Lake beds of Fayum. Early faulting of Great Rift valley. |
| | *Eocene.* | Nummulitic limestone of N. Africa coastlands; in Sokoto, northern Nigeria; Somaliland; Coasts of Kenya Colony. Tanganyika Territory. Sheringoma in S. Mozambique. *Aturia* beds of S.W. Africa. Widespread volcanic eruptions in Kenya. |
| | | MESOZOIC |
| | *Cretaceous.* | Neocomian to Up. Cretaceous along eastern coast of S. Africa. Neocomian-Cenomanian in Mozambique; Urgovian-Senonian in Tanganyika Territory. Cenomanian-Danian Egypt. Lower to Up. Cretaceous along the Atlas mts. Albian in Angola. Turonian, Benue valley. Kapitian Phonolites of Kenya Colony. Nubian sandstone in Nubia, Abyssinia, and Somaliland. |
| | *Jurassic.* | Upper.—Meragalleh limestone in Somaliland and Kimmeridgian-Purbeckian, with giant reptiles and marine beds, in Tanganyika Territory. Ammonite beds near Mombasa. |
| | | Middle.—Kenya and Tanganyika Territory. |
| | | Lower.—Bathonian and Bajocian limestones in Tanganyika Territory, Kenya (Kambe limestone), Somaliland, and Madagascar. |
| | | Lias. Tanganyika Territory and Jubaland. |
| *Karroo System.* | | Rhaetic. Drakenberg lavas. Upper Tanga beds with plants. Coal series in Natal. |
| | *Trias.* | Marine. Terrestrial Trias in S.S. Tunisia and Atlas Cave sandstone and Molteno beds. Mazeras sandstone with *Dadoxylon* forest in Kenya coastlands. |
| | | Upper Beaufort. Kenya coastlands. Burghersdorp beds of S. Africa. Lubilache sandstones of Congo basin. |
| | | PALAEOZOIC |
| | *Permian.* | Lower Beaufort in S. Africa. Tanga beds. Sabaki shales with *Palaeanodonta*. Tanga beds. Upper Lualaba sandstones of Congo. |
| | *Carboniferous.* | Upper Uralian. Ecca beds with coal-fields of Transvaal and glacial Dwyka conglomerate in S. Africa. Wankie coal in S. Rhodesia. Coals in Tanganyika Territory and Congo. Glacial beds in Congo and Madagascar. |
| | | Middle.—Absent. |
| | | Lower.—Witteberg series of Cape Colony. Crinoid and *Productus* limestone in Egypt. |
| | *Devonian.* | Bokkeveld series of Cape Colony. Marine beds of Sahara, Libya, and Sudan. |
| | | Table Mountain sandstone. |

| | |
|---|---|
| *Silurian.* | Central Sahara. |
| *Ordovician.* | Absent. |
| *Cambrian.* | N.W. Morocco and Gulf of Akaba. |

PAMPALAEOZOIC (PRIMAEVAL)

| | |
|---|---|
| *Upper Division.* | Waterberg sandstone of S. Africa. Oendolongo beds, Angola. |
| *Middle Division.* | Transvaal, Ventersdorp, and Witwatersrand systems in Transvaal and S.W. Africa with representatives in Rhodesia, southern Congo. Lepi series of Angola. Kandelurgu and Karagwe quartzites of Tanganyika and Uganda. Banket series of Gold Coast. |
| *Lower Division.* | Swaziland system with gneiss Schists of the main foundation of the African continental plateau. |

Authoritative works dealing with the continent of Africa as a whole in any of its aspects are comparatively rare. Besides such volumes the following list includes, therefore, books containing valuable information concerning large or typical sections of the continent.

I. General Descriptions. Herodotus (edit. G. Rawlinson, 4 vols., 1880); Ptolemy *Geographia* (edit. C. Müller, vol. i., Paris, 1883–1901); Ibn Haukal, "Description de l'Afrique" (trans. McG. de Slane), *Nouv. Journal asiatique* (1842); Edrisi, "Géographie" (trans. Jaubert), *Réc. de voyages . . . Soc. de Géogr.*, vol. v. (1836); Abulfeda, *Géographie* (trans. Reinaud and Guyard, 1848–83); M. A. P. d'Avezac, *Description de l'Afrique ancienne* (1845); L. de Marmol, *Description general de Africa* (Granada, 1573); L. Sanuto, *Geografia dell' Africa* (Venice, 1588); F. Pigafetta, *A Report of the Kingdom of Congo*, etc. (1597); Leo Africanus, *The History and Description of Africa* (trans. J. Pory; edit. R. Brown, 3 vols., 1896); O. Dapper, *Naukeurige beschrijvinge der afrikaensche gewesten*, etc. (Amsterdam, 1668; also Eng. vers. by Ogilvy, 1670, and Fr. vers. Amsterdam, 1686); B. Tellez, "Travels of the Jesuits in Ethiopia," *A New Collection of Voyages*, vol. vii. (1710); G. A. Cavazzi da Montecuccolo, *Istorica Descrittione de tre Regni Congo, Matamba, et Angola* (Milan, 1690; an account of the labours of the Capuchin missionaries and their observations on the country and people); J. Barbot, "Description of the Coasts of North and South Guinea and of Ethiopia Inferior," *Churchill's Voyages*, vol. v. (1707); W. Bosman, *A New . . . Description of the Coasts of Guinea*, etc. (2nd ed., 1721); J. B. Labat, *Nouvelle relation de l'Afrique occidentale* (5 vols., 1728), and *Relation historique de l'Éthiopie occidentale* (5 vols., 1732); B. d'Anville, *Mémoire conc. les rivières de l'intérieur de l'Afrique* (Paris, n.d.); M. Vollkommer, *Die Quellen B. d'Anville's für seine kritische Karte von Afrika* (Munich, 1904); C. Ritter, *Die Erdkunde* (i. Theil, 1. Buch, "Afrika," Berlin, 1822); J. M'Queen, *Geographical and Commercial View of Northern and Central Africa* (Edinburgh, 1821), and *Geographical Survey of Africa* (1840); W. D. Cooley, *Inner Africa laid open* (1852); E. Reclus, *Nouvelle géographie universelle*, vols. x.–xiii. (1885–88); A. H. Keane, "Africa" in *Stanford's Compendium* (2 vols., 2nd ed., 1904–07); M. Fallex and A. Mairey, *L'Afrique au début du XXe siècle* (1906); Sir C. P. Lucas *Historical Geography of the British Colonies*, vols. iii. and iv. (1894, 1904); *Journal of the African Society; Comité de l'Afrique française: Bulletin; Mitteilungen der afrikan. Gesellschaft in Deutschland* (1879–89); *Geographical Journal.*

II. Geology, Climate, Flora, Fauna:—E. Krenkel, *Geologie Afrikas* (1925); L. de Launay, *Les Richesses minérales de l'Afrique* (1903); A. Knox, *The Climate of the Continent of Africa* (1911); P. Reichard, "Zur Frage der Austrocknung Afrikas." *Geogr. Zeitschrift* (1895); *Peterm. Mitt.* (1905); G. Fraunberger, "Studien über die jährlichen Niederschlagsmengen des afrik. Kontinents" *Peterm. Mitt.* (1906); D. Prain and W. T. Thiselton-Dyer, *Flora of Tropical Africa* (10 vols., 1888–1906); K. Oschatz, *Anordnung der Vegetation in Afrika* (Erlangen, 1902); A. Engler, *Hochgebirgs-flora der tropischen Afrika* (1892); *Die Pflanzenwelt Ost-Afrikas und der Nachbargebiete* (3 vols., 1895), and *Die Vegetation von Afrika* (*Engler Botan. Jahrbücher*, 14 vols., etc.); W. P. Hiern, *Catalogue of the African Plants collected by Dr. Friedrich Welwitsch in 1853–1861* (2 vols., 1896–1901); W. L. Sclater and P. L. Sclater, *The Geography of Mammals* (1899); H. A. Bryden and others, *Great and Small Game of Africa* (1899); F. C. Selous, *African Nature Notes and Reminiscences* (1908); E. N. Buxton, *Two African Trips: with Notes and Suggestions on Big-Game Preservation in Africa* (1902); G. Schillings, *In Wildest Africa* (1907); R. Lydekker, *The Geographical History of Mammals* (1896); A. R. Wallace, *The Geographical Distribution of Animals* (1876). (X.)

## ANTHROPOLOGY AND ETHNOLOGY

**North Africa and Egypt.**—Apart from Egypt and the Nile Valley the divisions of Africa north of the Sudan are in the main political and from the anthropological standpoint almost entirely artificial. Not only are the Egypto-Tripolitan and the Morocco-Algerian frontiers entirely conventional, but even the Libyo-Tunisian frontier lacks the ethnic significance it might possess if instead of leaving the Mediterranean in the neighbourhood of Cape Roux it ran almost due south from the Gulf of Gabes. The political divisions of the western portion of North Africa—Africa Minor—thus stand in sharp contrast to its natural unity, so well-defined between the desert and the Mediterranean that the early Arab geographers named it Geziret el Magreb, "the Western Island." It is also necessary to realize that the predominantly Arab complexion of North Africa and the general substitution of Hamitic languages by Arabic began little more than 1000 years ago, while to appreciate the vast area of country over which the spread of Arab influence has obliterated or modified the earlier Berber tongues reference should be made to some such linguistic map as that given by Meinhof in *Die moderne Sprachforschung in Afrika* (Berlin 1910).

**The Berbers and Their Position in North Africa.**—While Sergi (*Antropologia della Stirpe Camitica*, Turin, 1897) regards the Berbers as the northern branch of the Hamitic stock (the Eastern Hamites being typically represented by proto-Egyptians, Beja and Galla), Keane (*Man, Past and Present*, Cambridge, 1920) quotes T. A. Joyce to the effect that it is impossible to prove the connection between Eastern and Northern Hamites, and that the latter should be regarded as the African representatives of the Mediterranean race. The question is largely a matter of terminology, since we cannot doubt the close relationship of the groups commonly termed Mediterranean, proto-Egyptian, and Beja.

The term Moor, which is often applied to the townsmen of Morocco, is here purposely avoided, and with Collignon and Deniker ("Les Maures du Senegal," *L'Anthropologie*, 1896) is restricted ethnically to a group of peoples lying between the Senegal River and Morocco and extending east to the Tuareg country.

**Egypt.**—For Egypt alone in North Africa it is possible to construct a connected anthropological record, which, in spite of gaps, reaches back to the very dawn of history. Some forty years ago Flinders Petrie and J. E. Quibell discovered at Naqada and Ballas in Upper Egypt a series of cemeteries belonging to a people with a mode of life and habit of burial utterly different from those of the dynastic civilization previously known in Egypt. Their discovery was followed up and extended by de Morgan, who recognized that Petrie's "new race" preceded even Mena, traditionally the first ruler of a united Egypt, whose tomb he found and excavated. Unfortunately de Morgan applied the term "neolithic" to this newly discovered people, a complete misnomer —though still used in French works—since detailed archaeological examination indicates that copper occurs in the earliest graves in

these cemeteries. These early inhabitants of the Nile Valley are now known as the predynastic or proto-Egyptians, terms which respectively emphasize their position in time and their ethnic relation to the other inhabitants of the Nile Valley.

**The Pre-dynastic Egyptians.**—The proto-Egyptians have been best described by Elliot Smith, who writes of them (*The People of Egypt*, Address to Cairo Scientific Society, 1909) as a people slightly below the average size of mankind, with muscular development so feeble that it may be difficult to determine to which sex an isolated skull belongs. In physical character they exhibit a remarkable degree of homogeneity. Their hair was dark, and either straight or wavy, never woolly. In the men apart from a chin-tuft beard there was the scantiest development of facial hair. These proto-Egyptians had long narrow heads with a narrow forehead and prominent occiput, so that the skull when viewed from above presents a characteristic form which has been termed "coffin-shaped." The face was a moderately long and narrow ellipse, and the chin was almost always pointed. More precisely, they were longheaded, with a cranial index of 73 (Naqada) and a mean height estimated at a little under 65 inches for men and about 60 inches for women, and though there can be no direct evidence as to skin and eye colour there is no doubt that they had dark eyes and skins of a yellowish brown or pale copper colour.

**The Dynastic Egyptians.**—All this applies only to the population of Upper Egypt; knowledge is lacking of the inhabitants of the delta at this early period, as of the whole of Lower Egypt until the time of the pyramid builders. Among the skeletons of this date from the neighbourhood of the pyramids Elliot Smith found a considerable number in which the skeleton was more robust, with a bigger and especially a broader skull without the angularity and the projecting occiput of the proto-Egyptian type; there are modifications in forehead, orbits and nose, with particularly obvious differences in the jaw, in fact the type of man buried round the pyramids belonged to that well characterized group known as the dynastic Egyptian, which in antiquity is represented by the Saqqara "Scribes" and the Sheikh el Belled, and is essentially that of the peasant Egyptians, the *fellahin* of the present day. For a detailed account of skeletal material, and especially of crania, throughout the dynastic period *see* A. Thomson and D. Randall-Maciver *The Ancient Races of the Thebaid* (Oxford 1905). Elliot Smith (*The Ancient Egyptians*, 1923, chapter 7), arrays evidence that long before the New Empire, Egypt was permeated from end to end by this foreign element, which in his opinion carries the physical traits of the Armenoid race. There is however one difficulty in accepting this view, which does not arise from any examination of the skeletal remains but results from the large number of portrait statues which the Egyptians have left to us, namely, that although so many of these statues exhibit the broader face and heavier jaw brought in by the alien race, not one of them exhibits any approach to the typical Armenoid, so-called "Jewish," nose. If therefore the foreign element is to be termed Armenoid it can only be called by this name so long as it is realized that this does not imply the presence of one of the most characteristic features of that race as known at the present day. The difficulty is not lightened by the fact that less than 1000 years later at Beni Hassan there are excellent representations of the Aamu, a people of the eastern desert with typical Armenoid noses.

**Contemporary Representations of Beja.**—The proto-Egyptian type persists to the present day among the southern Beja (*q.v.*), tribes of the Anglo-Egyptian Sudan. It also occurs, though probably in less typical form, among the Ababda of the Eastern (Egyptian) Desert and the riverain settlements in the neighbourhood of the first cataract. We have direct evidence dating from about 2000 B.C. of the existence of the pure proto-Egyptian type among a people wearing their hair in the same fuzzy mop as the Beja of the present day on the eastern border of Egypt. Among the wall paintings of the 12th Dynasty in the tombs at Meir (A. M. Blackman, *The Rock Tombs of Meir*, vol. ii., Pl. xxx., London, 1915), is one that undoubtedly represents a Beja. The long thin figure and limbs, with broad chest, narrow flanks and retracted abdomen, are no doubt conventional and exaggerated representations of the characters of the lean pastoral desert men as they appeared to the agricultural Egyptians, but there can be no criticism of the splendid naturalism of the lined face, the thin pointed nose and the mop of hair projecting over the forehead and standing out stiffly over the whole head to the nape of the neck. The beard is the usual chin tuft of the Beja tribes, and comparison with modern Beni Amer clinches the identity of the two peoples, living in the same desert area but separated by 4,000 years. Confirmatory evidence of the proto-Egyptian characters of the inhabitants of the eastern desert and of their civilization is offered by the discovery by G. W. Murray of a burial of late pre-dynastic date, with characteristic grave goods, near Ras Samadi on the Red Sea Coast, in lat. 24° 59′ N. (*Man* 1923, *81*). The skull accorded well with those of the pre-dynastic Egyptians.

The desert must indeed be regarded as a reservoir not only of early archaic physical types no longer preserved in the richer Nile lands but also of ancient ideas and appliances, *e.g.*, the camel stick of the Ma'aza of the Eastern Desert is no other than the *Uas* sceptre of ancient Egypt applied to a new use.

**The Arab Element.**—The Arab conquest, which politically altered the whole history of Egypt, had no appreciable influence on the physique of its inhabitants. While in part this may be due to a certain physical resemblance between Arabian and Egyptian the numerical inferiority of the conquerors must be held to be the determining cause. The nature of the invasion may be best illustrated by considering the history of the Juhaina (Sudanese, Guhayna). The tribesmen took a prominent part in breaking the power of the Christian kingdom of Nubia; yet in spite of their importance in the past, at the present day few groups that may fairly be called Arabs exist except in association with the desert. Such are the fisher folk of Lake Menzaleh, who trace their origin to Sinai; the Harabi of the Fayum, extending into the Tripolitan desert, still pastoral nomads; the Aulad Ali of the Behera district of the Delta, no longer nomads; and the practically sedentary Howeitat of Matarieh; all dolichocephals or low brachycephals. In the Eastern Desert the only important Arab tribe is the Ma'aza, about whom very little is known, described by Chantre (*Recherches Anthropologiques en Egypte*, Lyon, 1904), as short dolichocephals.

Besides these more or less well-defined groups there is in Upper Egypt a small number of people, generally mobile in their habits, living along the edge of the cultivation. These folk generally keep goats and often own a few palm trees, and formerly may have been of more importance as charcoal burners. Somewhat in the position of gypsies in England fifty years ago, they are generally unpopular with the *fellahin*, on whom they levy a certain amount of blackmail. Such groups as the Bili, near Baliana, and the Aleiqat, of whom there are a considerable number near Qus, do not come into this category.

In Sinai, with a total population of some 10,000, the chief tribes are the Howeitat, the Tiyaha and Terabin, in the North; in the South the Tawara (*i.e.*, the people of Tor), who include the Aleiqat, the Sawalha and Muzeina.

**The Modern Egyptian.**—Passing to the *fellahin*, the modern Egyptian, the most important of the numerous studies that have been made are those of C. S. Myers ("Contributions to Egyptian Anthropology," in vols. xxxv., xxxvi., and xxxviii. of the *Journal of the Royal Anthropological Institute*) and of J. R. Craig ("Anthropometry of Modern Egyptians," *Biometrika*, vol. viii., 1911). Omitting the province of Aswan and the town dwellers, these papers, which must be regarded as complementary, indicate that the Egyptian peasant has a stature of approximately 65½in., showing no sharp division between Upper and Lower Egypt; he is longheaded, with a cephalic index of about 75, the cephalic index—again omitting Aswan—being about a unit higher in Lower than in Upper Egypt. There is no evidence that the natives of various provinces differ in variability, nor is it possible to resolve distribution curves, whether of measurements or indices, into components corresponding to hypothetical underlying ethnic types, though it seems that passing from Lower to Upper Egypt

eye and skin colour darken and the proportion of unusually broad noses increases as does the frequency of spiral and crisp hair, all evidences of increased though still well diluted negro blood in the population.

The position of the Copts (the Christian population of the present day, and therefore with insignificant exceptions the descendants of the Egyptians who refused to relinquish their faith at the Conquest or during the succeeding centuries) is particularly interesting. The observations available refer to Coptic peasants, not town dwellers, and so far as these go the remark commonly made by Europeans that they can distinguish at sight between Muslim and Copt is not borne out. No significant deviation from the general Muslim population is found as regards head measurements or facial characteristics, though the nose is slightly less broad and the lip slightly thinner, with eye and skin colour a trifle lighter. Thus, diagnosis at sight between Copt and Muslim, if really practicable, cannot rest on easily defined physical characteristics but must be attributed to such other factors as gait, dress, etc.

BY COURTESY OF NORTHERN BAPTIST CONVENTION

A NATIVE OF BELGIAN CONGO

Of powerful physique and expert huntsmen, a few of the tribes in the Belgian Congo persist in cannibalism

The measurements and photographs of natives of Kharga Oasis published by Hrdlicka (*The Natives of Kharga Oasis, Egypt,* Washington, 1912) show that its inhabitants are Egyptians, differing in no essentials from the inhabitants of the Nile Valley. The inhabitants of Siwa speak a Berber dialect, akin to Tuareg, with many Arabic loan words, some so profoundly modified that their origin is not immediately apparent. Jaghbub (Jarabub), in Italian territory, is believed to have been uninhabited before its occupation by the Senussi, whose capital it now is.

**Disposition of the Fellahin.**—Difficult as it is to sum up the temperament or disposition of a people it is probably true to say that the *fellahin* are in the main good natured, cheerful and excitable, genuinely religious but not generally fanatical, though certain centres such as Tanta have a bad reputation in this respect. They are liable to occasional bursts of ferocity (such as distinguished the rioting of 1919), and inter-village enmities, leading to fights with iron-shod staves, were formerly fierce and persistent. Nothing approaching an adequate account of the beliefs and customs of the *fellahin* has yet been written, for Lane's *Modern Egyptians,* first published in 1836 before western influence had contaminated Egyptian habits and modes of thought, though giving an invaluable account of Cairene life and manners cannot be held to apply except in somewhat general terms to the habits and beliefs of the peasants, which even preliminary inquiry will show to vary not only from those of the towns but as between Upper and Lower Egypt. Meanwhile the work of Miss Winifred Blackman (*The Fellahin of Upper Egypt,* 1927) avowedly only a preliminary account, contains much useful information.

**Tattoo, etc.**—Tattooing is the most obvious, common and widespread method of bodily enhancement and mutilation. Lane mentions the simpler designs—dots, lines and circles—common in women and refers to the "extremely displeasing" habit of the women of Upper Egypt of discolouring their lips with tattoo. C. S. Myers ("Contributions to Egyptian Anthropology, Tattuing," *J.R.A.I.*, vol. xxxiii., 1903) found that of about 400 male subjects nearly 100 were tattooed, the designs falling into two main classes, namely simple, generally geometrical, designs, and pictorial representations, *e.g.,* the façade of a mosque or the Persian lion with sword. Local examples of the type prevailing throughout North Africa form the first class while the latter are derived from eastern sources. Circumcision is universal; clitoridectomy, though far less recognized by Europeans, is customary in cities, at least among the poorer class, and may be equally common among the Fellahin Both long antedate Islam, circumcision being represented in a tomb of the pyramid age at Saqqara, while clitoridectomy or a similar operation is alluded to by Strabo —*Circumcidunt etiam mares et foeminas excidunt.*

**Survivals from Ancient Egypt.**—One of the most interesting features of present day Egypt is the persistence in popular belief of ideas traceable to ancient Egypt, especially intricate ceremonies connected with mourning, the survival of the belief in *ka* or double, the persistence of a ceremony in which a sacred boat takes a prominent part, and the superstitions connected with particular days in the calendar. The boat ceremonies are particularly important, since these exist widely in Asia outside the Near East (*e g*, in Ceylon) and it seems probable that their distribution has been to a considerable extent brought about from Egypt by the spread of Islam. Nearly 20 years ago the writer observed a full-sized river boat suspended in a tree outside Luxor; enquiries showed that once a year this was placed in a cart, filled with children and dragged round the fields. Actually there are three boat processions every year in Luxor, the most important being observed in honour of Abu'l Heggag, the patron saint of Luxor The substitution of Amon and his sacred barque by Abu'l Heggag and his Nile boat is suggested by the popular belief at Karnak that on certain nights the golden boat of Amon may still be seen to emerge from the waters of the sacred lake, steered, as of old, by the Pharoah.

The calendar customs are a striking example of how beliefs attached to a particular day may last for over 3,000 years, persisting through a complete change in the mode of reckoning time, as well as the introduction of new beliefs. The Sallier papyrus, which dates from the time of Rameses II. or possibly his successor, gives an account of the lucky and unlucky days in the year, and describes in some detail the quality of the good and bad luck, with instructions for behaviour on each of these days. It may first be noted that the five epagomenal days of the old Egyptian year were unlucky. In modern Egypt the epagomenal days are still observed to the extent that neither sowing nor planting should be undertaken, mares and cattle should not be covered lest their offspring be misshapen, and it is even believed that children begotten during these days will show some abnormality. A still more interesting example perhaps is that afforded by a day near the end of the old Egyptian month of Choiak; the Sallier Papyrus marks the 26th of this month as most unlucky, and of this day it is written, "Do not eat fish. Those residing in the midst of Tattu turn themselves into the fish An." The mythological allusion cannot be explained, but the modern popular calendar, such as is hawked about the Bazaars, notes that on the 11th of Moharram (corresponding to the 26th day of the Coptic month Kyhak) "the eating of pigeons is liked, that of fish disliked."

**The Beja Tribes of Egypt.**—Of the Beja tribes of the eastern desert the Ababda (*q.v.*) fall wholly within Egyptian territory; the Bisharin extend some 80 miles south of the boundary and occupy a strip of territory stretching along the right bank of the Atbara. While the physical characters of both tribes have been studied by E. Chantre (*Recherches Anthropologiques en Egypte,* Lyons, 1904) and the mode of life of the Bisharin described by Linant de Bellefonds (L'Etbaye, 1858), two recent papers by G. W. Murray ("The Ababda," *J.R.A.I.,* vol. liii., 1923, and "The Northern Beja," vol. lvii., 1927) constitute by far the most valuable account of these people. The Ababda inhabit the eastern desert from the Sudan frontier to north of the Kena-Kuseir road, and there are isolated colonies along the edge of the cultivation from Assiut to Korosko. In the time of Bruce their southern range was limited by the 'Atawna (Arabs) who have now vanished from the desert. Earlier yet Makrisi records the Beli (Bili) a tribe of which scattered groups still exist along the edge of the cultivation—as being in possession of parts of the desert now belonging to the Ababda. The desert Ababda intermarry with the Bisharin, and those settled in the Nile Valley with the Fellahin, but they do not appear to intermarry with any Arab tribes still carrying the desert tradition. Like other Beja tribes the Ababda wear the *dirwa,* the shock head-dress of hair

besmeared with mutton fat, though this custom is gradually dying out. Unlike their Beja neighbours to the south the Ababda speak Arabic, but coloured by Bedauye (*To-Bedawi*) words, while transposition of consonants—a Hamitic rather than a Semitic feature—often occurs

In physique the Ababda resemble the Beni Amer, and therefore the predynastic Egyptians, *i.e.*, they are longheaded with a cephalic index of 73·6 and a stature of 1·63 metres. The Bisharin on the other hand present two types, those of the Red Sea coast with a cephalic index of 74·7, and those living inland with a cephalic index of 78 4, the latter substantially identical with the index given by Chantre, presumably derived from individuals living in or near the Nile Valley. (Murray, *op cit.*)

**Tripoli.**—Westwards beyond the Egyptian frontier knowledge of the physical anthropology of Tripoli is but slight. At the extreme west of Italian territory, *i.e.*, in the area surrounding Tripoli city, the systematic observations of Bertholon and Chantre show that the population is predominantly long-headed and of rather low stature (below 1·65m ) but there is an island of high brachycephaly in the immediate area of Bu Ajilat, though these brachycephals exhibit no marked departure from the general low stature of the area. Throughout the rest of Tripoli but few observations have been made, certainly not enough to permit of any connected anthropological history or description of the country. The observations of the late Oric Bates at Mersa Matruh, not far east of the Egyptian frontier ("Archaic Burials at Marsa Matrûh" *Ancient Egypt,* 1915, Part IV., p. 158) suggest that at a period possibly as remote as that of the pyramid builders the population of the coastal plain was not unlike that of the proto-Egyptians, and presumably a people of some such type long continued to form the basis of the population of the coastal plain. Evidence such as that afforded by the ram of Bu Hamama (in Algiers) crowned with the sun-disk and uraei, as well as the presence of the sun-disk on Carthaginian coins, indicates the very considerable cultural influence exercised by Egypt along the north African littoral in late dynastic times, but so far there is no direct evidence of Egyptian influence on the physical anthropology of the country. Nor is there any knowledge in this sense of the effect of the Roman occupation. Herodotus, however, describes the Libyans east of Lake Tritonis, *i.e.*, the inhabitants of Tripoli, as nomadic and thus differing from the settled agricultural peoples of what is now predominantly Algeria, although it is clear that many of these people were in fact no more than semi-nomadic; the Nasamones for instance with their main settlements on the Syrtic shore, left their herds in summer and went up to Aujila for the date harvest, just as some "nomad" Arab tribes of the present day sow their crop in the oases in the autumn, leading a more or less wandering life until the spring.

Apart from the littoral belt the greater portion of Tripoli is desert or poor steppe, for the most part with an annual rainfall varying from three to less than ten inches, such a country can never have been densely populated or have offered any great temptation to highly civilized folk. The position is different with regard to nomads or semi-nomads; here is a sparsely inhabited area which could scarcely fail to attract the Arab tribes that poured into north Africa after the conquest of Egypt under the Khalif Omar, and again in the eleventh century when, in 1048, the Wazir of the Fatimid Khalif Mustansir launched a number of the nomad tribes of Upper Egypt, including the Beni Halal, against his master's orthodox vassals of the northern African States. Each man was given a camel and a gold piece on condition that he would settle in Maghreb, with the result that within two years Cyrenaica had been pillaged and Kairwan captured. But the western movement of the Hilali invasion did not stop here, for while the majority of the Beni Hilal settled in Tripoli and Tunis, and the Athbej passed into what is now Algeria, as far as the Aures mountains and the river Zab, the Makil pressed westwards as far as the high plateau of Morocco-Algeria. Beneath this flood the Berber tongue largely disappeared, and except among the Beni M'zab, the Abadite schism was almost wiped out.

At the present day the population of the coastal plain may for practical purposes be regarded as Arab, and since with the exception of the towns and the oases of the far south the coastal plain—never more than 20 miles in width and generally less than this—constitutes almost the whole of the available territory suitable for agriculture, the Arab tribes of this area form the predominant factor in the population of the country. Of these tribes the Awlad Ali may be taken as the type. Extending from the outskirts of Alexandria to the neighbourhood of Tobruk they grow a considerable amount of barley, and (at any rate before World War I) possessed horses, sheep and camels, the latter constituting their main wealth. Predominantly sedentary, and horsemen rather than camel-men, they yet live in tents. Their tribal organization is into sections and divisions as among the Arabs of the Sudan, whom (*e.g.*, the Kababish) they closely resemble physically to judge from the measurements given by Chantre But not all the folk who have been described as Tripolitan Arabs are long-headed; an examination by Mochi ("Presentazione di crani d'indigeni di Tripoli" *Archiv. per l'Antrop. e la Etnol.,* Florence XL, 1912, p. 381) of the skulls from Tripoli in the National Museum at Florence indicates that they contain at least one hyperbrachycephalic group. Remarkable as is this fact, its significance becomes clear in the light of a series of skulls described by Giuffrida Ruggeri ("I Crani Egiziani antichi e Arabo-Egiziani dell' Università di Napoli," *Atti della Società Romana di Antropologia,* XV., 1910, pp. 112 *et seq.*) from an ancient Arab cemetery at Abassieh near Cairo, with an average cranial index (13) of 85·3. The significance of these skulls and their relation to definite areas of round-headedness in Tripoli has been studied by Seligman ("The Physical Character of the Arabs," *J.R.A.I.*, vol. xlvii., 1907), who points out that their characters indicate that the Abassieh skulls belonged to natives of Southern Arabia, that brachycephaly prevails both in southern Arabia and in the Levant, and that both these areas have contributed to the population of North Africa.

**Barbary (Tunis, Algeria, Morocco).**—Tunis, Algeria and Morocco, are but artificial political divisions of one natural area, which from the anthropological as well as the geographical aspect might still be called by its old name of Barbary. Its inhabitants, the Berbers, are commonly regarded as aborigines, and apart from immigrant stocks this seems to be true as far back as the end of the palaeolithic period. The physical anthropology of the natives of Eastern Tripoli, Tunisia and Algeria, has been exhaustively studied by Bertholon and Chantre (*Recherches anthropologiques dans la Berberie Orientale Tripolitaine, Tunisie, Algerie.* Lyon, 1912). The following facts give a rough idea of the progressive weakening of Arab influence, passing from East to West, and the physical characteristics of the three main groups generally recognized.

In Tunis, with a total Islamic population of something over two millions, there are about half a million Berberized Arabs and less than 100,000 Berbers, forming for the most part two isolated masses, the Matmata in the far south in the neighbourhood of Jebel Nefusa, and a group mainly of the Ababdite (Kharijite) heresy in the island of Jerba. Passing westwards to Algeria there are pure Berber groups in the Kabyle hills and in the Aures mountains. Apart from these two areas the remainder of the province of Constantine may be regarded as inhabited by Arabized Berbers except for a few Arab coastal areas. Numerically some 75% of the inhabitants of the province may be regarded as Berber or Berber-speaking, the remainder Arabs or partially Berberized Arabs. In the department of Algiers Arabs mixed with Arabized Berbers preponderate, while in Oran the Arab element is frankly dominant. In Morocco on the contrary the Berbers are not only in great numerical majority but socially form by far the most important groups. Here it is calculated that not more than five per cent of the population are Arabs, with perhaps another five of Berberized Arabs, the remainder of the population being fairly equally divided into pure Berbers and Berbers with a tinge of Arab influence. Nothing would be gained by attempting to enumerate the "Berber" and "Arab" tribes of Morocco. Westermarck (*The Moorish Conception of Holiness,* Helsingfors, 1916) divides the Berbers into five groups:—(1) the Ruâfa—the Berbers of the Rif—whose country extends along the

Mediterranean coast from the neighbourhood of Tetuan to the Algerian frontier; (2) the Berāber, who inhabit the mountain regions of Central Morocco and the eastern portion of the Great Atlas; (3) the Shleuh, inhabiting the western part of this range, and to the south of it in the province of Sūs a territory with an eastern frontier running from Demnat in a south-easterly direction and a northern frontier uniting Demnat with Mogador on the Atlantic coast, following more or less closely the foot of the mountains; (4) the Dra'a, who inhabit the valley of the Wad Dra'a in the extreme south of Morocco; (5) various tribes living in the neighbourhood of Ujda, in the north-east of the country. The so-called "Arabs" are the Jebala, the mountain-dwelling tribes of Northern Morocco, with their centre in the area between the Rif and Fez and extending westwards of the latter.

**Physical Characteristics of the Berbers.**—Morocco, is from the standpoint of physical anthropology for the most part unexplored. Three physical types of Berber are, however, generally recognized: (1) tall men, with a stature of about 1·70m , dolichocephalic, with strongly marked supraorbital ridges, the face long, tending to oval, the cheek bones by no means prominent, nose long and narrow, chin square and rather scant beard. This type appears to form perhaps half the population of Tunisia and is widespread in Algeria. (2) The second type is short, with a stature of about 1·63m., longheaded, with a prominent occiput so that the head when viewed from above is distinctly pentagonal; the face is short and broad, the cheek bones well developed, the nose tends to be broad, the chin prominent and often well bearded, the lips full. This type is to be found in the mountains of central Tunisia, in the neighbourhood of Gabes and of Algiers, in the south of Algeria, as well as all over Morocco. It seems to be generally accepted that the skulls found in the megalithic monuments of this part of Africa belong to one or other of these types. (3) The third group is of moderate stature, 1·64m. to 1·65m., and brachycephalic. The face is broad and short, the forehead round (*bombé*), nose short and broad. This type is specially present in the Island of Jerba and in the oasis of M'zab; it is also found in the hills to the south of the Gulf of Gabes, western Tripoli, and on the Algerian littoral, as well as among the Kabyles and the inhabitants of the Aures hill. Many of the M'zab have a skin so pale that they burn wheaten colour rather than brown in the sun.

While the number of the blonde Berbers certainly varies locally and their proportion has no doubt often been exaggerated (at least in Algeria), a competent anthropologist, the late Anthony Wilkin, specially studying the problem, has recorded that of the observed population of El Arbaa fully 20% were "fair men" (*Among the Berbers of Algeria,* 1900, p. 77). Good observers always lay stress on the essentially white quality of the skin of the pure Berber tribes. The origin of this blonde element has been much discussed; it is no doubt foreign—presumably Nordic, with perhaps Alpine admixture—and it existed in Libya as long ago as the New Empire, as is shown by contemporary paintings in Egyptian tombs.

**Cultural Characteristics of the Berbers.**—On the psychical side some of the main Berber characteristics can perhaps be best appreciated by contrasting them with those of the Arab; moreover such a comparison is particularly useful since apart from the Nile Valley it in some sense embodies an epitome of the history for some 1,200 years of the whole of North Africa.

The Berber is essentially an agriculturist, with a passionate love of the soil upon which he has been born, though a keen trader, often willing to take service abroad but always anxious to return to his village in his old age or when he has amassed a competence. He is a stern fighter, often a determined brigand and in religious matters a born sceptic, while his strong democratic tendencies are indicated by his social organization in which leadership is usually a matter of election, though raiding and war may give real authority to individual strong men which may to a limited extent pass to their descendants. In contrast, the Arab is typically a nomad pastoralist, whose attitude to agriculture is mirrored in the proverb that shame enters with the plough, a poor worker, whose real courage is less likely to be shown when raiding than on a point of honour or as an expression of his religious faith. Moreover, Arab society is essentially aristocratic; the Arab is, and always has been, ruled by hereditary leaders, and his struggles when he does revolt are spasmodic, and directed against the individual rather than the system With this aristocratic and religious bias there exists a strong contempt not only for the stranger but for Muslims of other sects, and here again he stands in strong contrast to the Berber These contrasts are of course not absolute; there are nomad Berbers, and many sedentary Arabs; some Berbers become really good Mohammedans, though generally there is much truth in the epigram that the Berber is not a Mohammedan but only thinks he is. Moreover, in the West, *i.e.,* in Algiers and Morocco, there is always the difficulty of knowing whether a given people not obviously Berber or Arab should be regarded as Arabized Berbers or Berberized Arabs. Here social organization and history rather than language seem to be the best guides.

**Political and Social Organization of the Berbers.**—In spite of the religious and cultural influence of Islam the social organization of the Berbers differs in every essential from that of the Arabs. The following outline (*see* MacIver and Wilkins, *Libyan Notes,* London, 1901), in principle valid throughout Barbary, applies specifically to the Kabyle Hills. The Berbers are typically hillmen, living in isolated villages, formerly often well fortified or with a central citadel, and, while possessing flocks and herds which in particular instances may regulate their mode of life, are essentially skilled agriculturists, who have long practised irrigation and are quick to take advantage of every scrap of cultivable ground in the difficult and often sterile hills among which they live.

The unit of government is the village, each possessing complete autonomy. A number of villages form the tribe, the connection being administrative and not regulated by kinship. A union of several such tribes may be termed a Confederation; the bond is looser than in the lower federative grade and the confederation never interferes in the affairs of its tribes unless directly appealed to or when vitally necessary. In time of war a head is appointed for each of the tribes and for the confederation. The tribe has deliberative and administrative duties, such as the determination of questions of peace and war, the making of roads, and manages tribal property such as mosques, tombs of saints, and educational establishments; it is concerned with the levying of taxes necessary for these purposes, and may act as arbiter between villages. A general assembly of the tribe is almost unknown, its affairs being managed by a deputation of the chief men from each of the villages composing it.

Every village is brought into contact with its neighbours by means of its *sof,* of which there are always two, the term signifying a group whose members covenant to render mutual aid to one another in cases of necessity. In each village the two *sof* are in some sense opposed, and each *sof* will be allied with similar fraternities in neighbouring villages, the ramifications of the *sof* organization extending through entire districts. Within the village the members of each *sof* are united by the closest bonds, the obligations ranking above all personal interests and even ties of kinship. Nevertheless, though loyal to his *sof* while he is a member of it, the Kabyle thinks little of transferring his allegiance from one *sof* to another if he thinks he will gain thereby, and outside the village the members of a *sof* though willing to assist their fellows with provisions and even with money would expect to be paid for any active armed assistance they might give. The funds of the *sof* are raised by subscription from members and are administered by the heads of the organization, usually men of powerful families and of private wealth, who may disburse considerable sums on secret services without rendering account to the members.

Within the village affairs are controlled by the *jemâa,* the general assembly of the citizens, of which every adult man is a member though in practice only the old men and heads of families exercise the right to speak. Nothing which concerns the welfare of the village escapes the control of the *jemâa*—it exercises judicial authority, makes laws, levies taxes and administers the public property. Decisions are not taken by a majority of votes

introduction of Islam In the south, although the negro has given his name to the Sudan (*Bilad el-Sudan*, the Land of the Blacks of mediaeval Arab authors) and has excited the greatest interest from mediaeval times onwards, yet adequate knowledge is lacking of the habits, customs and religion of any one tribe.

The tribes of the Northern area belong to two great families, (*a*) Hamite, and (*b*) Arab. The Hamites proper include the group of tribes known historically as the Beja (*q.v.*) inhabiting the Red Sea Province and outside the Anglo-Egyptian Sudan extending into Eritrea. Less purely Hamitic, but none the less to be classed as Hamites, are the inhabitants of Nubia, commonly called Berberines or Barabra (*q.v.*), for, in spite of much negro blood and a language which is commonly regarded as negro, history indicates that fundamentally they are of Hamitic origin, while their civilization is not and seems never to have been negro in character. (*See* ARABS; BARABRA; BEJA.)

The true negro undoubtedly represents one of the most primitive of the African stocks. His main physical characteristics are tall stature, a "black" skin, woolly hair and moderate dolichocephaly, a flat broad nose and thick and often everted lips, prominent cheekbones and a varying degree of prognathism. With these qualities there go certain cultural characteristics. Such true negroes are found in the far western Sudan and the Guinea Coast, but hardly in the valleys of the Nile or of its affluents where as far as many of its most characteristic groups are concerned there is evidence of old Hamitic mixture. It is indeed scarcely possible to go further than this at the present time. In a classification proposed by Westermann, based on linguistic criteria, the term Nilotic is used in a sense so wide that it seems to signify no more than related to the Nile valley, but within it three groups are constituted, "High," "Middle" and "Low" Nilotic, which in part at least may be natural.

1. The High Nilotic group, comprising Mittu, Madi, Abukaya, Abaka, Luba, Wira, Lendu and Moru.

2. The Middle Nilotic group, comprising Shilluk, Anuak, Beir, Jur, Belanda and many of the peoples of Eastern Uganda, the Acholi, Lango (*q.v.*), Aturu and Jaluo.

3. The Low Nilotic group, comprising Dinka and Nuer.

This classification, though of wider geographical scope, embraces the whole of the Anglo-Egyptian Sudan, but the Bari with their numerous constituent "sub-tribes" are not mentioned, nor are the Lotuko-speaking tribes. Westermann places the former in his Nilotic-Hamitic group, *i.e.* with the Masai, Turkana, etc. to which the Lotuko-speaking tribes may also be assigned. For descriptive purposes, the following scheme is proposed:

A. Tall "black" dolichocephals, comprising Dinka, Shilluk, Nuer, Anuak, with perhaps some others as yet unclassified. These are the typical Nilotes of most writers, and in this article the term will be confined to this group. The mesaticephalic Acholi no doubt arose within this group, which probably also gave origin to the Belanda and the (Shilluk-speaking) Jur.

B. Tall "black" mesaticephals (probably sometimes brachycephals) comprising some Nuba and probably a number of the little-known tribes of Dar-Fung, including the Barun.

C. Medium statured "black" dolichocephals, comprising the Bari (but probably not the majority of the Bari-speaking tribes of the west bank), the Lotuko-speaking tribes and perhaps some of Westermann's High Nilotic group.

D. Short mesaticephals, with skin showing a coppery tinge—the Azande—or with blacker skins as the Bongo, Mittu and probably a number of the tribes now constituting the Azande nation. Knowledge of this group is very limited.

This classification by no means includes all the tribes of the Sudan. Many of the peoples of the Bahr-el-Ghazal Province are quite unknown ethnologically, *e.g.* the Moro, the Kaliko, the Bukuru (Babuckur) and the Liggi, and even the relations of such important Bari-speaking tribes of the west bank as the Mandari, Kuku, Kakuak, Nyangbwara and Fajelu, are far from clear. Nor is there any substantial knowledge of the Madi, who in the south cross the political boundary into Uganda. In the east, on the borders of Uganda and Abyssinia, are groups of unknown tribes, some of which may constitute ethnic units, *e.g.* Didinga, Longarim, Murle, with perhaps further north and nearer the Nile the Beir (Ajiba), all said by J. H. Driberg (unpublished information) to speak dialects of one language. The position of the Dongotono is obscure, while Driberg considers the Lorwama to be a section of Lotuko-speaking Lango. (C G S)

## EAST AFRICA

The geographical area which is included under this designation extends roughly from the north frontier of Kenya Colony as far south as the Zambezi, and includes Kenya Colony, the Uganda Protectorate, Tanganyika Territory, Nyasaland and Portuguese East Africa.

We cannot say for certain who were the original inhabitants of this vast territory, for as yet our archaeological data are too scanty, but a number of tribes preserve in their mythology and legends recollections of what may have been a bygone autochthonous race. Thus the Akikuyu tell of cannibal dwarfs known as Maitoachiana, and both the Nandi and Masai have traditions of fantastically shaped ogres with cannibalistic instincts. Probably the nomads, who still exist under a variety of names wherever the natural conditions permit, represent the earliest inhabitants of whom we can have any knowledge. In this area they occupy a subordinate, almost a servile position, live by trapping and hunting, or by collecting roots and berries, are often shy, elusive creatures of the forest, rarely seen, and at other times are engaged in what their neighbours consider the menial task of blacksmiths, and always dreaded for their knowledge of poisons and witchcraft. Excluding these nomads, the races of East Africa fall into the following groups: (1) Bantu; (2) Nilotic; (3) Nilo-Hamitic. The Bantu are subdivided into Lacustrians and eastern Bantu. The classification is really linguistic, but happens to be sufficiently valid in this case as a cultural criterion. Thus by Bantu are meant all those peoples of Africa who use the root *ntu* or some similar word to express human being. *Ba-* is the plural personal prefix of which *mu-* or *omu-* is the singular. Thus we speak of *Muganda*, a Ganda person and *Baganda*, Ganda people. As the prefix is really redundant we shall refer to the Bantu tribes without the prefix and speak of Ganda, Nyoro, Swahili and so on.

The history of East Africa is the history of the Hamites, for the various groups are differentiated by the degree and nature of their Hamitization. The Bantu-speaking peoples are an early mixture of negroes and Hamites, and a series of later waves from the north-east, culminating in the great upheaval of the 16th century, of which the Galla expansion under Mohammed Granye and his invasion of Abyssinia in 1537 was a symptom, profoundly affected East African cultural relations. The Lacustrians were further Hamitized and a Hamitic autocracy imposed itself on many of the conquered Bantu peoples to the north and west of Lake Victoria. The Nilotics or inhabitants of the Nile valley, a parallel fusion of negroes and Hamites, with possibly a Semitic element added as well, were dispossessed of their tribal territories in what is now the south-eastern Sudan and were dispersed by invaders from the east. The bulk of them moved northwards and became the modern Shilluk, Dinka and allied tribes, but a few followed natural lines southwards, and to-day are known as the Acholi, Lango, Alur, Jopaluo and Jaluo. The invaders themselves were what are often known as "Half-Hamites," a rather meaningless term to which Nilo-Hamitic is preferable, as they are in fact increasingly Hamitized Nilotics. Southern Abyssinia and regions round Lake Rudolf have during the last 400 years witnessed a perpetual ebb and flow of immigrant peoples, more and more Hamitized, who were deflected by the Nile valley and moved southwards to populate the highlands of Kenya Colony and Tanganyika, until gradually the whole area from these highlands to the Horn of Africa was filled up with mainly pastoral peoples of Hamitic ancestry. This centrifugal movement southwards was

only checked by the intervention of western Powers in whose absence the process would undoubtedly have continued despite temporary checks such as the defeat of the Masai at the hands of the Bantu Hehe. This wedge of Nilo-Hamitics thrust southwards into Bantu areas appropriated the highlands to their pastoral requirements and separated the eastern Bantu from the Lacustrians The eastern Bantu were agriculturalists and content with the lower highlands and the coastal regions, but under the stress of isolation came very much under the influence of their Hamitic neighbours, and though linguistically they remain Bantu they have assimilated many of the characteristic features of Hamitic culture

The coastal belt and the adjacent islands, including Zanzibar and Pemba, are inhabited by the Swahili, whose language is morphologically Bantu and who are therefore generally classed as such Culturally, however, they are not homogeneous and have few Bantu affinities. Since Abdul Malik bin Muriani brought his Syrian builders in A.D. 659 to found his African kingdom, a succession of colonizing waves from Persia and from the Oman established a Mohammedan empire over the whole coastal region from the Lamu archipelago to the Zambezi. These immigrants brought their own culture, interbred with and assimilated the local Bantu at each of their administrative and trading centres. Thus was gradually formed the Swahili language, largely Arabic in origin, though structurally Bantu; and this was the genesis of what are now known as the Swahili people, or more properly the Swahili-speaking peoples, a heterogeneous conglomerate of localized dialects and customs, based on the original Bantu tribes who both assimilated the alien Mohammedan culture and incorporated in it no inconsiderable portion of their own. There were early Chinese voyages to the east coast of Africa, relics of which in pottery and coins, have survived on the coast from Lamu southwards. The Mongoloid eye found sporadically throughout this area, may also be a survival of Chinese infiltration, though other explanations are possible.

The Lacustrian and eastern Bantu meet in Tanganyika Territory and gradually the typical Bantu characteristics reassert themselves, though now we find a social organization with a more pronounced military bias than we encounter farther north. Typical of such tribal polities are the Hehe of Tanganyika Territory and the Yao of Nyasaland, whose organization, though much the same as that of their neighbours the Anyanja, is more closely knit and adapted to the exigencies of war. This may in part be due to the influence of the Angoni, an offshoot of the Zulu who fought their way north and penetrated as far as the southern shores of Lake Victoria. They were finally conquered by the Nyamwezi, a tribe also Zuluized and organized for military purposes, and were permitted to settle in their present homes. The Simba appeared on the lower Zambezi in 1540 and triumphing over the Portuguese and their African allies pushed north-east and succeeded in capturing Mombasa, before they were finally defeated and apparently annihilated near Malindi. The whole of this southern area has for centuries been the battle-ground of warring tribes, marching and counter-marching in almost inextricable confusion, achieving an evanescent eminence and as rapidly fading to comparative insignificance. Consequently there are fewer individual characteristics, the distinctions are less clearly cut, and their affinities are southern and western rather than northern. They belong to the southern Bantu more than to the Lacustrians despite the common characteristics which are part of the Bantu inheritance as a whole. The Thonga of Portuguese East Africa, for instance, very definitely merge into the southern complex and in Nyasaland the Anyanja extend into Rhodesia and come into contact with distinct Zambezi affinities.

In an area so complex and so full of cultural conflict it would be difficult to summarize the salient characteristics both briefly and adequately. Overlapping between the different groups is inevitable owing to the diffusion of cultural elements from one to the other and emphasizes the impossibility of a rigid classification. A fair picture, however, may be obtained of tribal cultures (social organization, mode of life and religious beliefs) by a concise examination of representative tribes in each group, with allowance for individual variation from the norm. The nomads require separate mention, and the Ganda and Ankole represent the Lacustrians The Nyika group represent the eastern Bantu. The Hehe and Angoni represent the fusion of the Lacustrians and the eastern Bantu with their southern influences Lango represent the Nilotics and Masai the Nilo-Hamitics

## WEST AFRICA

West Africa was inhabited in prehistoric times, ancient stone implements being found in Senegal, the Sudan, French Guinea, the Ivory Coast, Gold Coast and Nigeria, and sites are frequently found in the Sahara in regions now barren, but which no doubt anciently enjoyed different climatic conditions North Africa was probably peopled by men of Mediterranean race, then by Eastern Hamitic people (dark-skinned, fine features, soft hair), the modern Berber resulting from their admixture. Later came the Jews and Arabs. The Pygmies or Negrilloes, were pushed back by negroes from Central Africa, and were established in the area lying between the Sahara and the Gulf of Guinea and between the Atlantic and Lake Chad. Negrilloes and negroes at first interbred among themselves, then mixed with Berbers and peoples of Hamitic and Semitic stock, thus giving rise to higher grade peoples such as the Bornuan, Kanuri, Hausa, Mandingo, Yoruba and Ashanti.

**Principal Ethnic Groups.**—The following provisory classification rests on physical, cultural and institutional data:

I. White race: Berbers, Fulani
II. Black race: *a*) Senegalese-Guinea family
*b*) Nigerian Senegalese ,,
*c*) Volta ,,
*d*) Guinea ,,
*e*) Lower Nigerian ,,
*f*) Hausa ,,

**Social Organization: General.**—The social unit is the family in the strict sense, and more often the extended family, a group occupying the same enclosure whose members are divided into classes consisting of parallel generations having equal rights, with labour and ownership in common. Several related family groups form a village quarter. The distinct and organized clan is rare; more easily distinguished is the identity of the tribe and sub-tribe. Matriarchy is rare. Marriage is seldom exogamous, nearly always patrilocal; the children are attributed to the father, and descent is usually traced in the paternal line. Family authority devolves upon the father or the patriarch assisted by elders. Common ownership of family goods, with individual ownership of personal property, is almost universal. Women are usually at liberty to dispose of their own property. Succession to the family possessions, of which women form part, is vested sometimes in the brother and sometimes in the son of the deceased. On the Ivory Coast, in the Upper Volta and Nigeria, a husband allows his wife to cohabit with another man, the children belonging to him. Marriage between brothers-in-law and sisters-in-law is frequent. Personal possessions are heritable in the same way as family goods, but frequently men succeed to a man's goods and women to a woman's.

**Government.**—Many bush peoples (Liberia, Ivory Coast. Southern Nigeria) and peoples of the French Sudanese region (Gourounsi, Bobo, Lobi, Bariba) live in small independent groups. Elsewhere kingdoms have been constituted, very often theocratic in character and ruled over by a priest-king or by a king and a priest reigning together (Nigeria, Dahomey, French Sudan, Upper Volta) and uniting the civil and magico-religious power. Ministers and councillors assist the sovereign. The Queen-Mother (Gold Coast, Nigeria) possesses authority. The heir to the throne is often chosen, by an electoral group, from certain families according to local hereditary laws.

**Religion.**—Islam spread, in particular, over Mauritania, Senegal, the Guineas, the Niger valley, the Hausa country, Bornu and Nigeria; elsewhere, there is general belief in a supreme deity, in a sky and an earth god, and in inferior gods. Respect is paid to ancestors. Gods and ancestors share in the life of the social group. Various methods of divination are in vogue to ascertain their will. Infraction of certain sacred inhibitions (murder, the shedding of blood) are displeasing to the gods and are regarded as sins and require compensation and expiation. Family and clan cults are found, more rarely tribal cults. Sacrifices, frequently of a seasonal character (altars, trees, stones, hills, streams), insure fertility and fecundity, there being a close association between magic and religion. The head of the family is the domestic priest, and the descendant of the first occupant of the country is the priest of the earth. Sacerdotal colleges, male and female, are frequent (Dahomey, Ashanti, Yoruba). Traces of totemism are found in French Sudan, Ashanti, Dahomey, Nigeria. Numerous tribal, clan, family, individual, occasional and professional tabus, probably of totemic origin, are recorded.

Belief in witchcraft is general, the sorcerers being supposed to be able to change themselves into animals, injuries to the animal inflicted during the metamorphosis appearing on the sorcerer's body. There are special laws and punishments for sorcery.

Initiation of members of the social group is by successive degrees in secret ceremonies to adolescents, adults and men of full experience. They seclude the grades in the forest or in sacred groves. The neophyte is considered to have died and to have been reborn with a new personality, and receives instruction (moral, religious, technical, aesthetic). His position in the group depends on initiation. There are similar but less complicated ceremonies for women.

In Nigeria the king was frequently slain after he had reigned for a certain period, or when he grew old (Yoruba, Jukun, Hausa); the same custom appears to have existed in the French Sudan (Mandingo, Dogon).

Cannibalism and head-hunting have almost disappeared, but existed on the Ivory Coast, in Liberia, Dahomey and Nigeria. In former times human sacrifices were followed almost everywhere by a feast at which the victim was eaten. (H. LAB.)

## SOUTH AFRICA

The natives of Africa south of the Kunene, Okavango and Zambezi rivers fall into three main divisions, known respectively as Bushmen, Hottentots and Bantu. These divisions represent a series of successive waves of southerly migration by which the peopling of the country has been effected. The Bushmen, a race of short yellowish-brown nomad hunters, are the earliest human inhabitants of South Africa of whom there is any reliable historical record. Recent archaeological research, however, has established clearly that they were not the first to occupy the country, but are an invading people who superseded the original inhabitants of this part of South Africa. From the evidence afforded by their cultural remains it seems likely that at a very early time they occupied the hunting grounds of tropical East Africa and gradually passed southwards until, when the written history of the country begins, they were roaming all over the territory south of the Zambezi river.

By this time they were already being encroached upon by the Hottentots, who resemble them greatly in racial characters and in language, but are a pastoral people with a more complex material culture and social organization. The Hottentots seem to have sprung out of a mixture of the old Bushman population of East Africa with an early migration of Hamites from whom they obtained their cattle and certain elements of their language. They migrated south later than the Bushmen, and after crossing the upper waters of the Zambezi passed on to the west coast and down to the south coast, where they were found by the first Europeans to touch at the Cape.

The Bantu peoples are the latest of the native inhabitants to have entered South Africa. They all speak languages belonging to the characteristic Bantu language family of Africa (*see* AFRICAN LANGUAGES), but in racial characters they vary considerably, though certain negro characteristics predominate. They seem to have originated as a distinct variety somewhere in the neighbourhood of the Great Lakes and to have migrated South at various times between about the 12th and 15th centuries, each of their main groups (*see* below, *Principal Groups*) representing a different series of tribal movements.

The impacts upon one another of all these different peoples, and the later advance inland from the Cape of the European settlers, resulted in a complicated series of wars, migrations and extermination, in which the Bushmen and the Hottentots were almost completely broken up, while the original distribution and condition of the Bantu were profoundly disturbed (*see* SOUTH AFRICA, *History*).

BY COURTESY OF THE PRESBYTERIAN BOARD OF FOREIGN MISSIONS

A HAUSA HEADMAN

More Arab than negro, the Hausa peoples are intelligent, well developed physically and good traders

**Principal Groups.**—At the present time the Bushmen are confined to the Central and Northern Kalahari and neighbouring regions. They are there [illegible] in the southern portion, each speaking its own language (*see* BUSHMAN LANGUAGES), but as a result of intermixture with the neighbouring Bantu peoples they have to a great extent lost their purity of race. The Hottentots were formerly divided into four main sections—the Nama, Korana, Gonaqua and old Cape Hottentots—but of these the only relatively compact group to-day are the Nama, who are found chiefly in the southern half of South-west Africa. The others have either died out or completely lost their racial entity. The Bantu peoples, on the other hand, are still vigorous and powerful, and are increasing in numbers. They are divided into numerous small tribes which on the basis of cultural and linguistic differences, may be classified into the following groups:—

(*a*) Eastern, or Zulu-Xosa, which occupies the coastal region East of the Drakenberg mountains and South of the Sabi river. This group includes the so-called "Kafirs" of the Transkei (*i.e.*, the AmaXosa, AmaMpondo, AmaMpondomisi, and AmaTembu), the "Fingoes" of the Cape Province, who are the fugitive remnants of tribes broken up in Natal during the great inter-tribal wars at the beginning of last century, the Zulu peoples of Natal and Zululand, with their offshoot the Matabele (AmaNdebele) of Southern Rhodesia, the AmaSwazi of Swaziland, and the BaThonga (AmaTonga) and kindred tribes of Portuguese East Africa.

(*b*) Central, or Sotho-Chwana. This group occupies the greater portion of the interior plain North of the Orange river, and includes among many others the BaTauana about the Botletle river and Lake Ngami, the BaMangwato of North Bechuanaland, the degraded BaKalahari of the Kalahari desert, the BaKuena, BaNgwaketse, BaRolong and BaTlaping of Central Bechuanaland, the BaHurutse, BaPedi, BaKgatlha and kindred tribes of West and Central Transvaal, the BaVenda of the North East Transvaal and the celebrated Basuto of Basutoland.

(*c*) The so-called "Mashona" peoples of South Rhodesia, including the BaNyai or BaRoswi and the AbeNanswa immediately South of the Zambezi river, the MaKaranga (MaKalanga), WaManyika and BaZezuru of Mashonaland and the VaNdau of Portuguese East Africa.

(*d*) South-western, comprising the OvaHerero and the OvaMbo peoples of South West Africa. They are each divided into various tribes which between them occupy the northern half of the region between the Western fringe of the Kalahari desert and the Atlantic ocean.

Another distinct, though less important, division of the natives of South Africa is constituted by the Bergdama (Haukhoin), who inhabit the coastal region of South West Africa. Their racial history is still far from clear. Physically they are a true negro people, yet they are isolated far from others of their kind; they

live an extremely primitive life, and speak the language of the Naman, to whom they have long been in subjection.

**Social Organization.**—Both the Bergdama and the Bushmen have very simple forms of social structure Among the Bergdama the social units are small, independent local groups, each consisting of a patriarchal family, together with any relatives who may put themselves under the protection of its head, and sometimes including a certain number of dependent families who do not feel capable of founding a settlement of their own. The Bushmen are divided into small hunting bands, each of which owns a definite hunting territory over which it wanders and out of which it may not venture except with the permission of the neighbouring group. Within this territory members of the band are free to go where they like. The organization of the band is of the loosest kind. There is no chief, but skilled hunters and the older, more experienced, men in general have a great influence in directing social affairs. The only other structure of any importance is the family, consisting of a man and his wife, or wives, with their dependent children. Marriage within the band appears to be forbidden. A wife generally joins her husband's people, although in some of the northern tribes the young couple remain with the wife's parents until after the birth of the first child.

Of the Hottentots the only section whose social organization has been studied are the Nama, comprising several tribes, each of which has its own territory, name and chief. The tribe, however, is not a centralized body, but is made up of a rather loose aggregation of clans with the chieftainship hereditary in one of them. The authority of the chief is slight. The heads of the other clans act as his council, and he cannot do much without their co-operation. Each clan consists of a number of families claiming descent from some remote ancestor in the male line after whom they are named, and marriage within the clan is strictly forbidden. Polygamy was formerly practised, but monogamy is now the rule.

Among the Bantu peoples considerable variation exists in details of social organization, but certain general features prevail. Each tribe occupies its own territory under its own chief. His authority is generally considerable, but his actual power is somewhat modified by a council consisting of some of his relatives and the more influential heads of families. The family or household group is always of great social importance. It is normally polygamous, and generally forms a distinct local unit, except among the central tribes, where there is a tendency for different household groups to collect together in villages. Even here, however, each household is distinctly marked off from the rest. Within the household each wife has her own hut; and with her children constitutes an economic unit with well defined legal rights. Marriage is patrilocal, and is legalized by the payment of a bride-price (*lobola*), generally in the form of cattle. There exists also an organization of the people into clans, which, except in the eastern group, are associated with totemism. Clan exogamy is customary, but does not obtain among the Sotho-Chwana tribes. Membership of the clan is determined by descent through the father, except among the OvaMbo, who are matrilineal people, while the OvaHerero have a double system of clans, one set with patrilineal descent, the other with matrilineal (*see* later, *General Features of Note*).

**Mode of Life.**—Levels of culture differ considerably. All the Bushmen in their original condition are hunters and collectors. They practise neither agriculture nor pastoralism, but derive their subsistence entirely from the game they hunt and from the wild vegetable foods which the women collect. Their chief hunting weapons are the bow and small arrows with detachable poisoned points, but they also make use of throwing-sticks, pitfalls, traps and snares of all kinds, while the women have pointed digging-sticks, which are sometimes weighted with perforated stones. They are a nomadic people, confined in the dry season to places well supplied with water-holes, but, when the rainy season comes, wandering about freely within the limits of their hunting territory. Their encampments are temporary, and their dwellings crude shelters of rush or reed. The Bergdama on the whole lead a similar mode of life, although many of them also keep goats.

The Hottentots are chiefly a pastoral people, with herds of long-horned cattle and flocks of fat-tailed sheep. Sour milk forms a staple element of their diet; and in contrast to all the Bantu except the OvaHerero, it is not the Hottentot men, but the women, who do the milking. Hunting also plays an important part in their economic life, their methods of hunting and their weapons being practically identical with those of the Bushmen. To some extent they are also nomadic, as fresh pastures for their herds are necessary from time to time. Their encampments, however, are less impermanent than those of the Bushmen. They live in beehive huts, covered with reed mats, and their settlements are arranged in circular form, leaving in the centre an open space in which the cattle are collected at night. Their material culture is on the whole superior to that of the Bushmen; in particular they smelt iron for the manufacture of their implements and weapons, while the Bushmen barter with the neighbouring Bantu peoples for whatever iron they require.

With the exception of the OvaHerero who are a purely pastoral people, all the Bantu tribes practise both hoe-culture and pastoralism. The eastern tribes are more predominantly pastoral, the others more agricultural, but all have this combined means of subsistence. Each household group has its own cattle and goats, as well as its own fields. The cattle are the concern of the men (except among the OvaHerero, where the women do the milking), the fields that of the women. The food supply is derived mainly from sour milk and from crops of millet and maize, supplemented in minor forms by pumpkins, peas, beans, etc., while for meat they rely chiefly upon the game hunted by the men. Cattle are never slaughtered for food except on ceremonial occasions. The life of the people is more or less sedentary. The eastern and south-western tribes live in beehive huts of thatch, the central and Mashona tribes in circular huts with conical roofs. The settlement is always arranged on the circular principle already noted among the Hottentots. All the industries are essentially domestic, practically everything required by the household being made within it. The one exception is in the case of iron implements and weapons, for which there are special workers, who barter their products for cattle and grain.

**Religion, Special Features.**—In religious beliefs there are certain fundamental features which appear to be common to both the Bushmen and the Hottentots, but there is also considerable variation in several important details All Bushmen pray to the moon and other celestial bodies, and have an extensive series of myths and legends relating to them. They believe also in certain mythical beings, known variously to different tribes as Cagn (the mantis), Huwu, Tora, Gauna, etc., who appear to be personifications of natural forces, especially those producing the rain, and are frequently invoked. These mythical beings are credited with creative powers, and are met with in various myths of origin. From references in their myths and folk-tales it appears that the Bushmen have further a well developed system of ritual relating to animals and other sources of food, but it is not known in any detail what that ritual is or was. There seem also to be certain beliefs and practices connected with the spirits of the dead, but concerning these the information available is vague.

The religious cult of the Hottentots seems in general to consist mainly in the worship of mythical heroes derived partly from animistic beliefs and partly from the personification of the natural forces producing rain. In their general attributes these beings, chief of whom are Tsui-goab, Heitsi-Eibib and Gaunab, strongly resemble those of the Bushmen. The worship of the moon also seems to have been prevalent among the Hottentots at one time, judging from the records of prayers made to it for food and rain. There is further an extensive ritual relating to the cattle, which, as the chief source of food, are of paramount importance to the well-being of the community; while water, another extremely important factor in the economic life of the Hottentots, also plays a part in numerous ceremonial performances and taboos. One of the chief functions of the medicine-men, as among the Bushmen, is always the making of rain.

Among the Bantu, the religious cult is very largely a strongly developed form of ancestor worship. This is primarily a domestic cult, each family through its eldest male representative worshipping its ancestors in the male line. On important tribal occasions

the chief also prays to his ancestors on behalf of the tribe as a whole. The ancestors are regarded as guiding the destiny of their living descendants, and are propitiated by means of sacrifices offered on ceremonial festivals such as birth and marriage and on other special occasions. All the Bantu have also some conception, often rather vague, of a power in the universe which is not connected with the ancestors. This power is often associated with the sky, but shows itself most impressively in the phenomena of the weather, and hence rain, lightning and thunder are considered its manifestations. It is also sometimes looked upon as the creator of all things and the moulder of destiny. It is met with under various names (such as Tilo among the BaThonga, Unkulunkulu and Inkosi among the Zulu, Modimo in the central tribes and Nzame among the OvaMbo), and the beliefs and customs relating to it differ considerably from tribe to tribe. There is further an extensive ritual relating to agricultural life and to the cattle (the OvaHerero have a sacred herd of cattle), while traces of a totemic cult are found in all the tribes except the eastern. Magic and witchcraft play an extremely important part in the lives of the people, and in connection with this shamanism has developed to a high degree, so that there are many different kinds of medicine men with special functions, such as rain-making, divining, "doctoring" the crops, purifying the army, healing disease, etc.

**General Features of Note.**—In physical appearance there are many features which readily distinguish the Bushmen from all other inhabitants of South Africa, save the Hottentots. They are typically short in stature, but not dwarfish. Their limbs are slight and finely shaped, the hands and feet being especially small; but there is a curious curvature of the spine which gives a great prominence to the buttocks, where also a great accumulation of fat (steatopygia) sometimes occurs in the women. The skin is yellowish-brown in colour, and wrinkles very easily. The hair is woolly and sparse, commonly very short, and is scattered on the head in little tufts, or "peppercorn" fashion. The head is small and markedly low in the crown, the face broad, with prominent cheek bones, bulging forehead and convex upper lip, the nose extremely flat, the eyes narrow and often slightly oblique; frequently there is no lobe to the ear. In the more northern and eastern tribes there is a distinct tendency towards greater stature, darker colour and better muscular development, while the head and face are longer and higher. These divergent characters are the result of intermixture with the neighbouring Bantu peoples.

The culture of the Bushmen is noted for the highly artistic paintings and engravings which they executed on the walls of caves and rock-shelters. The subjects portrayed are chiefly animals, human beings, hunting, battle and dancing scenes, and the representations are remarkable for their fidelity to nature. The practice of the art seems to have died out, but it proves a most important link in the chain of evidence connecting the Bushmen of South Africa with the Palaeolithic cultures of the peoples of Europe.

Of the social customs of the Bushmen, especially those connected with birth and marriage, little is known. Initiation ceremonies at puberty are common to all Bushmen. On reaching her first menstrual period a girl is secluded in her hut and has to observe various food taboos. In the northern tribes a special religious dance, known as the "eland bull" dance, is added in her honour. Initiation ceremonies for boys seem to be restricted to the northern tribes. The special tribal marks are cut by the medicine men between the eyebrows of the boys, who are then kept in a secluded spot for about a month. During this time they are instructed in the lore of the tribe, and religious dances are held in which animal masquerades predominate. The Tati Bushmen practise circumcision as part of the initiation ceremony, but they are the only Bushmen of whom this is known, and have probably adopted the custom from the Bechuana among whom they live. At death the corpse is usually buried lying on one side with the knees drawn up against the breast. The group then removes to another site.

The Hottentots resemble the Bushmen closely in appearance, and it is only in certain characters that there are any noticeable differences. They are taller than the Bushmen, and have distinctly longer and narrower heads. Their skull is also higher and the face more prognathous. They have, however, the same prominent cheek bones, small chin, flat nose and peculiar eyes as the Bushmen, while their ears are often also lobeless. Their hair and their skin colour are the same as in the Bushmen, and steatopygia is often more marked.

An important feature in their culture is the great prominence of the communal meal in their ceremonies. It is a means of curing a sick person by aggregating him to the group of those who have had the disease and recovered; of introducing young men and women to the life of full members of the tribe; of bestowing on a young mother the solidarity of the group of mothers with strong and healthy children; of welcoming a widow, or widower, into the group of the widowed, and so giving them a new place in the society as a whole. The part water has come to have in their ceremonial life because of its extreme value in their economic life is also noteworthy. In addition to there being a great annual rain-making ceremony, water plays an essential part in many religious ceremonies, is endowed with a special protective power in some cases, and is considered extremely dangerous in others. Rain, as the source of water, is also held sacred, and the natural forces producing it are even personified and worshipped.

The Bergdama are of considerable interest, as they appear to be the most primitive negro people known, apart from the Congo pygmies. They are of medium height, strong, even coarse, build, with long rather thick skulls, prognathous faces, broad noses, very dark, even black skin, and all the features typical of the true West African negro. What their original language was is not known, for they have been so long enslaved by the Hottentots that they have completely adopted the Hottentot language. Yet in ceremonial their lives appear to have been but little influenced by the Hottentots, and among them there is found what appears to be a very important feature of many Bantu cultures, the sacred fire round which the whole life of the society centres. Each little group has a sacred fire which must never be allowed to go out, but which must be guarded day and night by the chief wife of the patriarch. Day by day, when the members of the group go out to seek for food, the head of the group and the old men sit guarding the fire, and as long as that is aglow and respected by all, the hunters and collectors will find food for the day. All game must be laid by the sacred fire, and certain portions of it must be eaten ceremonially by the elders of the group. Each kind of berry and root, as it ripens, must be brought to the sacred fire before it can be eaten. All good, all evil hangs upon the guarding of the fire from all impurities, which come from breaches in the regulations as laid down in the traditions of the tribe.

Racially the Bantu peoples present a great variety of types. They are fundamentally negro peoples, mixed with Hamitic, negrillo and other types. The skin is usually less dark, stature lower, head less elongated, forehead flatter, prognathism less marked, nose generally more prominent and narrower than in the true negro. The Hamitic strain often shows itself clearly among the Zulu and allied tribes in a relatively narrow nose. The hair is uniformly of the ordinary negro type, the skin all shades from yellowish-brown to the black of the AmaSwazi, usually a reddish ground tint, dark chocolate colour being the prevalent hue. The Eastern tribes are on the whole taller and more dolichocephalic than the Central, while the South-western tribes are more typically negro than the rest.

The political organization of these peoples is well developed, and they have an elaborate system of laws regulating their social life. Among the OvaMbo blood revenge is still practised, but among the Central and Eastern tribes the tribal authority is supreme. All members of the tribe are regarded as belonging to the chief; an injury to them is, therefore, an injury to him, and compensation for death or injury must be paid to him. The Ama-Zulu and AmaXosa are renowned as fighting tribes, none of the rest being specially war-like; and among the former a strict disciplinary system was established by the great chief Chaka, who abolished the throwing spear, which is the typical weapon of this area, and introduced the short stabbing spear. By this reform he forced upon his warriors the necessity of coming to close quarters,

and from that time the Zulu became a dominant people and were able to found and develop a great military kingdom in South East Africa.

The initiation ceremonies at puberty of the Eastern and Central tribes are of some importance. The boys are initiated in groups, which are kept secluded in a special "lodge" for about three months, during which they are taught their tribal history, the moral and religious code of the society and its social etiquette. The ceremony itself consists in circumcision, performed by a special medicine man. These initiation "schools" are held every year in some tribes, in others at intervals of from four to five years. In each case the group of initiates is usually given a special name by which it is known throughout life. These groups play an important part in the tribal organization, and form the nucleus of the military system The Zulu do not have initiation schools, nor do they practise circumcision, but the system of initiation groups has persisted in the formation at regular intervals of military regiments comprising boys of about the same age. Girls are also initiated in groups at the time of puberty, and are not considered marriageable till they have passed through the ceremony.

The Central tribes have remains of a tribal totemism. Each independent section of the people, which may at one time have represented a clan, has a *siboko* or laudatory name, taken from some animal or some natural phenomenon. In former times there was a definite ritual connected with the species of animal so used. Nowadays, however, the main division of the people is into patrilineal clans, and the possession of a common *siboko* is no bar to marriage. In the Eastern tribes all traces of totemism, if it was ever present, have disappeared. They are all divided into clans each with its own *isibongo* (laudatory name) which is generally the name of the ancestor from whom the clan is thought to have sprung. Marriage between people with the same *isibongo* is not permitted. Very often, however, a clan will split up, a younger branch taking some more immediate ancestor as its *isibongo,* while the older branch preserves the more ancient *isibongo,* and intermarriage between the two branches is then permissible.

The OvaHerero clan system is a combination of the patrilineal and matrilineal systems. The people are divided in the first place into clans with matrilineal descent, called *eanda,* and then into clans with patrilineal descent, called *oruzo.* Every person belongs to the *eanda* of his mother, and the *oruzo* of his father. Both the *eanda* and the *oruzo* are totemic and exogamous. Each of these clan divisions has a different function. The *eanda* is associated with economic relationships, so that inheritance is in the female line. The religious life, on the other hand, is almost entirely connected with the *oruzo,* and is a developed form of ancestor worship, so that a man prays always to the ancestors of his father. Here again, the sacred fire is very prominent. At the chief's village the ancestors of the chief are worshipped, and represent the ancestors of the whole tribe. In addition the sacred fire is found in the kraal of each head of a family, lighted, in the first instance, from that of the chief. None of these fires must ever be allowed to go out. To this fire the women bring the milk each night and morning to have it blessed by the kraal head and the ancestors.

## ARCHAEOLOGY AND ETHNOLOGY

The boundary between Negro Africa and "White" Africa, *i.e.,* Egypt and the northern and north-western portions of the continent, must be both conventional and provisional. The explorations of Reisner at Kerma in Nubia (between the third and fourth cataracts) and of Garstang at Meroe, have carried Egyptian influence so far south in the Nile valley that these sites, although inhabited by peoples of mixed culture, must from the archaeological standpoint be referred rather to Egypt than to the Sudan.

No such line of division exists in the west between the North African cultures and those of negro-land; indeed Gautier ("Études d'ethnographie saharienne," *L'Anthropologie,* 1907) has shown that there is good reason to suppose that the latter has advanced perhaps as much as 1,000 km. at the expense of the former, during the last 2,000 or 3,000 years. Moreover, Meroe itself does not accurately represent the southern limits of the mixed civilization to which it has given its name; some 12 mi. south of Khartum on the right bank of the Blue Nile are the remains of Soba, a Meroitic site, later the capital of the Christian kingdom of 'Alwa (the Alut of the hieroglyphs), which Meroitic remains have been recently discovered 200 mi. south of Khartum.

Yet Meroe, which lies in the neighbourhood of the 17th parallel of north latitude, may well stand as the main southern bastion of Egyptian influence, and the area with which this writer will deal is that part of Africa lying south of 16° north, which will be divided into three provinces, eastern, western and southern.

The Nile-Congo watershed, a natural feature of geographical and ethnic importance, constitutes part of the dividing line between the eastern and western areas, which continues northwards along the broad ridge of relatively high land that roughly divides the territories of the Anglo-Egyptian Sudan from those administered by France. Thus the boundary line somewhat closely follows the western confines of Darfur, while south of the Nile-Congo watershed it coincides with the boundary between the Belgian Congo and British territories to the east, both eastern and western provinces being limited to the south by a line roughly following the 10th parallel of south latitude.

### THE EASTERN PROVINCE

**Palaeolithic Artifacts.**—Here discoveries have so far been limited to the Sudan, Uganda, Somaliland and Kenya Colony, while surprisingly little is yet known of the early pre-history of even these territories. Except possibly in the extreme north, within a few miles of Halfa, no implement of River-drift type is known to have been found in the Sudan. This fact may be due to incomplete exploration, but is of some significance considering the abundance of specimens which have been found on the surface in Egypt and Libya, in Somaliland (where H. W. Seton-Karr has collected countless specimens of River-drift and Mousterian types), South Africa, and recently, in deposits, by Wayland in Uganda, though the majority of the implements he discovered are perhaps to be associated with the Le Moustier *facies* rather than that of the River-drift. Be this as it may, Wayland has collected Chellean hand-axes in gravels, considered of Pleistocene date, capping quartzite hill-tops some 300ft. above the present level of the lake, and also implements of a well-developed Mousterian type, including "points, side-scrapers, flake knives, tortoise cores and tortoise points," as well as two typical side-scrapers in a cave under some five feet of cave earth. (A. A. Smith and E. J. Wayland, *Some Primitive Stone Implements from Uganda;* Uganda Protectorate, Geological Survey Dept., 1923.)

No typical Mousterian specimens have yet been found in the Sudan, but certain specimens collected from two sites, namely, Jebel Katul in north-west Kordofan, and Jebel Gule in Dar Fung, are considered by the Abbé Breuil to belong to the Mousterian period. So far as is known no implements attributable to the latter part of the Palaeolithic age have been found anywhere in the Eastern Province, certain pygmy implements which will be mentioned later being regarded as Neolithic. (C. G. Seligman, "A Neolithic Site in the Anglo-Egyptian Sudan," *J.R.A.I.,* vol. 40, 1910.)

river, there were found bones, including skulls, probably representing burials disturbed by flood, and some of these bones are definitely fossil. Here the skulls are of more than one type, (1) strongly built, dolichocephalic, and, apart from the lower jaw, somewhat resembling the Combe Capelle skull, (2) smaller, brachycephalic, represented only by women. The associated industry consists of fair-sized flakes, lunates and end-scrapers of obsidian, ostrich-shell beads and pearl shell pendants, as well as at least three types of pottery. Besides the effects of flood this site was disturbed some ten years ago, so that the original stratification may have become confused and the associated objects be of different ages.

### THE WESTERN PROVINCE

**Palaeolithic Remains.**—It is only recently that stone implements of River-drift type, and therefore to be regarded provisionally as of Palaeolithic age, have been discovered in West Africa In the British Museum there is a series of massive implements of Chellean type, consisting of quartz porphyry, which on the surface have weathered to the softness of chalk. These come from the alluvial deposits of the Bauchi plateau, as do a smaller number of implements of Mousterian type of the same mineral, and one very steep end-scraper of a more homogenous stone showing no surface weathering. (These implements are described by H. J. Braunholtz in *Occasional Paper* No. 4 of the Geological Survey of Nigeria.) There is also in the national collection a number of short stumpy implements of Drift type of a reddish quartzite, for the most part with unworked butt, found on the golf links of Accra (Gold Coast). Similar specimens have been found in the local gravels, the actual specimens in the museum having apparently been washed up from the beach.

**Neolithic Age.**—Polished axe-heads of ordinary Neolithic type are by no means uncommon in West Africa and the Congo valley. They are found in Northern Nigeria, especially in the Bauchi Plateau gravels, where it is said that they overlap to some extent the Drift types. They are, however, of a different stone, for the most part of dolerite. In the Gold Coast Colony they are found in large numbers, as are perforated quartz discs, while a few bossed spheres about 2in. in diameter, of anomalous appearance and unknown use, have been recovered. A collection of Neolithic implements from Calabar include stone axes, unusual in that they possess a definite tang for hafting.

Under the title "Tumbakultur" Oswald Menghin (*Anthropos.* 20, 1925) has described a culture characterized by series of implements, widespread in the Lower Congo area, which he tends to approximate, though with difficulty, to the Campignian of Europe. Be this as it may, Menghin finds a long series of artifacts passing insensibly from implements of coup-de-poing type, Campignian *pics,* flattened ovates of almost laurel-leaf type, to notched and roughly cruciform spear or arrowheads, some, though larger and coarser, irresistibly recalling the "freak" forms from Breonio in Italy. Apart from these, many ground stone axes have been found in the Congo area.

**Megalithic Monuments.**—Megalithic monuments are distributed widely in West Africa in the form of stone circles and standing stones. In Gambia both classes of monuments have been carefully described by the late Henry Parker in a paper published after his death (*Jour. Roy. Anth. Inst.,* vol. 53, 1923):—

"The circles themselves are generally found in groups or clusters comprising from two to nine, but single circles are met with. With one possible exception there are no uncompleted circles, except those formed by concentric outer pillars standing round an inner circle. . . . The groups of circles are arranged in single straight lines; in nearly parallel lines consisting of two, three or four circles; or in pairs; but never in triangles or pentagons. Many stones are prostrate and . . . almost invariably these fallen pillars . . . are at least partly buried by the soil. . . . Some have their upper face almost level with the ground, and as a rule the others are half or three-quarters covered by the earth. . . . Superficially considered this is the only indication of the age of these structures, and . . . it would be of great value if we knew the rate of elevation of the soil. Without such knowledge it is only possible to draw the conclusion from this evidence that both the circles and the menhirs must have been erected many centuries ago.

"In addition to the concentric outer pillars, there are several instances where the outer pillars are arranged on the eastern side of the circle in a straight line, or even in two parallel lines, in a north and south direction. Such lines are invariably to the east of the circle. . . ."

The circles are considered sacred to the Earth Spirit, and ceremonies are performed in them to propitiate the latter, as also for the protection of the crops. It does not, however, appear that Parker excavated in them, and their date and purpose must be left for further exploration, though in the light of information received on the spot the contents of the circle (human remains, spearheads, copper armlets) dug by J. L. Todd and G. B. Wolbach (*Man,* No. 96, 1911) suggest that in recent times these monuments were the sites of sacrifice for success in warfare.

In some of the northern villages of the Cross River Division of Nigeria, *i.e.,* in the villages of the Akayu, Indem and Atam districts (on the left bank of the Aweyong river) there are stone circles, the stones often more or less conical and carved to represent the human body from the waist upwards. These have been described and figured by C. Partridge (*Cross River Natives,* 1905, pp. 268–599); the navel is specially prominent, and cicatrices seem to be reproduced. At Agba village the circle surrounds an old tree, and the grove of the great chief who erected the circle. The tree is sacred, and of the stones it was said by the ancestors "these stones are your forefathers, your very great chiefs; every year you must sacrifice to them" (p. 271).

WOMEN SERVE AS CARRIERS IN AFRICA, COVERING 35 MILES A DAY

**Beads.**—In the past, claims of high antiquity have been made on behalf of the so-called "aggry" beads that have been found in West Africa. Yet as stated by Sir Hercules Read, with the single exception of the necklace to be discussed immediately none of these beads shows features not to be found in mediaeval or later beads from the factories of Venice. The necklace, presented to the British Museum by L. P. Davies, was obtained from the grave of "a renowned chief" at Mansu, a town on the route from Elmina to Kumasi. It is described in detail in *Man* (1905, 1).

For present purposes interest centres in some 20 beads of crystalline glass, irregular-faceted, and especially one bead of crystalline glass moulded like a mulberry. Sir Hercules Read writes of these as being in a state of iridescent decay, the surfaces being in many cases deeply pitted and presenting exactly the same appearance as beads of the same kind from the Mediterranean area. He points out that the crystalline glass in this necklace is identical in appearance with those from the tombs at Kameiros in Rhodes, dating from the 6th century, and goes on to suggest, but "without insisting too strongly on this point," that here are "glass beads of classical style found for the first time in West Africa, and presenting features that in point of date may justifiably be associated with the name and time of the Carthaginian Hanno, a name often invoked when objects of indeterminate age are found on the African coast."

Though probably not of any great age, reference must be made to the soap-stone carvings of human heads or figures (occasionally animal figures) found in the ground, sometimes apparently in pits, in certain districts of Sierra Leone, where they are used as agricultural charms. These figures are for the most part roughly carved, the work being well within the scope of present-day Africans, and Joyce (*Man,* No. 57, 1905, and No. 40, 1909), points out that there is really no reason to see in them—as has been proposed—evidence of foreign, *i.e.,* Egyptian or Carthaginian influence. The objects described by Frobenius from Old Ife (*The*

*Voice of Africa*, 1913, vol. i, chap. 14; "The Archaeological Finds"; and *Das Unbekannte Africa*, Munich, 1923), the ancient capital of the Yoruba, are also probably of no great age, there do not seem to be any which the 16th century Benin civilization might not have produced.

Possibly of about the same date are a number of bronze and silver objects, now on depôsit in the British Museum, from a sandy mound (no doubt a grave) at Tumuni in the Sokoto Province of Northern Nigeria. Sir Hercules Read holds that they exhibit features and analogies which are unusual in negro African metal work, pointing to artistic or commercial relationship with the culture of the Mediterranean area, doubtless at a period remote from the date of the manufacture of the relics themselves.

The most important pieces are a bucket with incurved sides and lugs, and a barrel-shaped armlet (?) for wear on the bicepital region. The lines and casting of both, and the geometrical patterns tooled on their surfaces, are good and careful work. While the find as a tomb-group may date to A.D. 1480, as suggested by H. R. Palmer, yet, as stated by Read, they are of unusual interest from the analogies they present with the early Mediterranean cultures, and we may have here a distant echo of the early art of the Bronze age. At the same time there is no reason to think that the actual objects are anything but local productions, though they may differ from those of more recent date

### THE SOUTHERN PROVINCE

**Palaeolithic Implements.**—Artifacts of rude Chellean type, often larger than the corresponding implements of western Europe, are found over the greater portion of South Africa, nor does there seem to be any reason why these should not be regarded as true palaeoliths perhaps of an age comparable to those of Europe. One of the most satisfactory finds of this order is constituted by a considerable number of implements of chalcedony, quartzite, etc., exactly similar to types characteristic of the River-drift Period of western Europe and Great Britain, associated with and evidently forming part of ancient terrace gravels deposited as drifts by the Zambezi (in the neighbourhood of Victoria Falls) at a remote period. The position of these terrace gravels and surface drifts in regard to the Batoka Gorge indicates their real antiquity, since they must have been deposited by the river when the latter was covering the old valley floor more than 400ft. above its present level. Here Henry Balfour excavated several implements from undisturbed gravel deposits at depths varying from 6in. to 2ft., some greatly water-worn and heavily patinated.

Recently A. J. H. Goodwin ("South African Archaeology," *Man*, 1927, 14, and "Capsian Affinities of S. A. later Stone age Culture," *South African Journal of Science*, vol. xxii., 1925) has summarized South African history on the following lines:—

The terms Palaeolithic and Neolithic are dropped, the two main periods being termed the Earlier Stone age and the Later Stone age, Péringuey's name for the main *coup-de-poing* culture of the Earlier Stone age, the Stellenbosch industry, being retained. A second culture, the Victoria West industry, centres round Victoria West in the south-central Karroo, running north into the Free State and west to Nakob on the S.-W. African border; the *coup-de-poing* occurs, but the main implement appears to be a core similar to the European Acheulean tortoise-core, but some 8in. or so in length. It is not clear whether core or flake was the desired element, but secondarily worked flakes of this industry have not been found. The last culture of the Earlier Stone age is that of Fauresmith in the Orange Free State, with a flake worked to resemble a *coup-de-poing* as the characteristic tool.

There is no evidence of the Earlier Stone age developing into the Later Stone age, indeed they probably overlapped. The earliest industry of the Later Stone age is that of Still bay (near Mossel bay) covering most of the eastern part of the Union and extending into the Free State and to Okahandja in South-West Africa. This culture somewhat resembles the Solutrean of Europe, with lanceolate implements (usually small) as well as tanged forms, sometimes with serrated edges.

The Still bay culture was followed by two probably contemporaneous industries which extend into modern times, termed from sites in the Orange Free State the Smithfield and Wilton cultures respectively. The Smithfield culture includes end-scrapers, thumbnail and horse-shoe scrapers, trimmed points (of Chatelperron type), handpicks, bored stones, ostrich eggshell beads, ground stone rings, pottery and human remains. The human remains are of the "Bushman" type, and in a general way this culture is similar to the Capsian or the Aurignacian of Europe. The Wilton industry is very similar; the chief implements are pygmy lunates, thumbnail, and end-scrapers, as well as geometrical forms; the pottery is similar to that of Smithfield; bone arrowheads and link-shafts occur; burials are flexed, with skeletons of the same general type as the Smithfield specimens Slate "palettes" are also found, and the culture is definitely associated with the cave paintings. Goodwin considers this culture as identical with the last phases of the Capsian of Spain and North Africa, a point of view confirmed by I. Schapera ("Some Stylistic Affinities of Bushman Art," *South African Journal of Science*, vol. xxii. Nov. 1925, pp. 504–15), who, as the result of a careful comparison of European Palaeolithic and Bushman art concludes that the Capsian art of Spain shows most affinity with that of the Bushmen.

Information supplied by Goodwin indicates the existence of a true Mousterian—the Glen Grey industry—with high-backed as well as the more usual flat points similar to those found in North Africa and Europe, while in the Later Stone age the recent discovery at Howieson's Poort of a number of true graving points (*burin*) is important, both in itself and as further suggesting contact with the north.

**Pottery.**—It is not clear that examples of pottery of any considerable age exist. Those figured by Péringuey (*Annals of the South African Museum*, vol. viii, 1911), provisionally assigned to Bushmen, Strandloopers and Hottentots, are of the rudest type, predominantly ovoid with conical bottoms, sometimes ornamented, the kneading and baking being very poor.

**The Bushmen.**—No apology seems necessary for considering the "archaeology" of the Bushmen with that of the kindred Strandloopers (no longer to be regarded as a distinct race, the name describing a mode of life and not implying a constant physical difference), for even though the former are not utterly extinct, the few survivors no longer pursue their characteristic arts of painting and graving on rock. It is generally admitted that the Bushmen stock came into South Africa from the north, and Stow was of the opinion that there were two great divisions, each with its characteristic mode of life and art, viz.: (1) cave-dwellers (painters), and (2) kopje-dwellers (sculptors), the latter producing their works by "pecking" the rock face on which they worked. This view does not seem to be generally accepted, perhaps it only emphasizes differences in technique due preponderantly to environment.

The paintings of the Bushmen, naturalistic monochrome and polychrome studies of high artistic merit, for the most part record the animals which they hunted and upon which they subsisted. But paintings of the carnivora are not absent, and cattle raids, dances and magico-religious (?) scenes are also portrayed. Belonging no doubt to the latter class are the fairly numerous examples of animal-headed human figures—representations of masked dances—not to be confused with the wearing of animal skins as a hunting ruse to admit approach to the game, as in the famous picture in the Hershel district of Cape Colony of a Bushman wearing an ostrich skin while stalking a flock of these birds.

The character of Bushman paintings has been well summed up by Henry Balfour:—

They are "remarkable not only for the realism exhibited by so many, but also for a freedom from the limitation to delineation in profile which characterizes for the most part the drawings of primitive peoples, especially where animals are concerned. Attitudes of a kind difficult to render were ventured upon without hesitation, and appreciation even of the rudiments of perspective is occasionally to be noted, though only in a crude and uncertain form. The practice of endeavouring to represent more than could be seen at one time . . . is far less noticeable in Bushmen art than might have been expected from the rudimentary general culture of these peoples, and one does not see instances of *both* eyes

being indicated upon a profile face, or a mouth in profile on a full face. . . . The colours were usually laid on uniformly over the surface which they individually covered, but a shading off is sometimes exhibited" (*Bushmen Paintings,* 1909, p. 9.)

Dr K. M Barnard points out that examples similar in execution to those described by L. Péringuey (*Trans. S. Afr. Philos. Soc.,* 16, 1906, and 18, 1909) have been discovered at various places in South-west Africa, the farthest north being in the Grootfontein district. In addition to the usual animals there are representations of the human foot, and the spoor of various bucks, while from the position in which these latter occur the explanation that they are "sign-posts" to water cannot be maintained

Major F. J. Bagshawe (see *Man,* 1923, 92) has discovered in Tanganyika Territory rock-paintings of Bushmen type of so high an artistic quality that their origin can only be referred to this race, an extension northwards which goes well with the distribution of the Bushmen *kwe* (digging-stick weight), of which specimens, known in Tanganyika, have been discovered in Uganda (Wayland) and even among the Bari of the Southern Sudan (Seligman). The Tanganyika rock-paintings include an eland, cow, ostriches, giraffe and antelope.

**Strandloopers.**—The Strandloopers are a people of whom, apart from their skeletal characters, we know little, though concerning these there is a fair volume of reliable if not always consistent data. Their cultural attainments may be judged, *e.g.,* from the remains found in the caves and rock-shelters of T'zitzikama cliffs, about 100m to the west of Port Elizabeth One of these shelters explored by F. W. Fitzsimons (described by Sir Arthur Keith, *The Antiquity of Man,* I, 1925), contained deposits some 30ft. deep. The lower 5ft. and the upper 6ft. were sterile; below this latter layer was a stratum some 7ft. thick in which numerous Strandlooper burials were encountered amidst remains of fireplaces, broken pottery, implements and ornaments in stone and bone. Then came the third stratum, over 6ft. in thickness. While removing this stratum and working at a depth of 15ft. below the original floor of the shelter, Fitzsimons found graves containing remains which differed from those he had met with in the stratum above. Unfortunately the bones in the lower stratum were imperfectly preserved. The graves had been partly protected by slabs of stone some of which had been rudely engraved with human figures. There were lumps of red ochre, necklaces of shell and bone and tools of stone and bone. In a still deeper stratum, also about 6ft. in thickness, there were traces of burials and hearths, the human remains being fragmentary, but considered to belong to individuals of the Boskop type.

**Mediaeval Remains in Rhodesia.**—The conclusions of D. Randall-MacIver (*Mediaeval Rhodesia,* 1906) that the Zimbabwe and similar ruins in Rhodesia are negro in origin and modern in date, though not generally accepted in South Africa, have not been disproved. For though there is no inherent improbability in the early Semitic origin of these ruins, it seems unnecessary to seek a foreign colonization where the facts in no way contradict a local origin. No authentic inscriptions have been found, and no objects discovered in the Great Zimbabwe, around which the controversy has chiefly centred, need be more than a few centuries old, while those that are not foreign imports (porcelain, etc.) are of African type. Moreover, a re-examination of the evidence, including unpublished material in the library at Lisbon, has led Father Schebesta (*Mitt. der Anthrop. Ges. in Wien,* 1922–23) to the conclusion that not only is the Zimbabwe a product of the indigenous kingdom of Monomotapa described by the Portuguese, but that its builders culturally resembled the Baganda, and probably certain other of the more advanced peoples of Central Africa.

## NORTH AFRICA

The archaeological documents of north Africa reflect the cultural conditions recorded in its ancient history, the imposition of successive alien civilizations by dominant Mediterranean Powers upon a receptive but resistant native population. The ancient invaders were (under their political names) Phoenicians, Greeks, Romans, Vandals and Byzantines; the Arab invasions, which began in the 7th century A D, belong to modern history.

**Native Cultures.**—The native Libyan and Berber (*q.v.*) elements, whether aboriginal or not, have persisted without visible change from the prehistoric period to the present day Their most ancient handiwork is represented by stone implements and simple pottery found in cave-dwellings, figures of men and animals engraved on rocks, some fortress-walls and many sepulchral monuments of megalithic type, square and circular dolmens, cairns and cromlechs. This material is related on the one side to the most primitive remains of Spain and south France, on the other side to those of Egypt and Crete; but while neolithic culture in the Egyptian and European areas was superseded in the prehistoric age, the African stone implements seem to have remained in use in certain districts until very recent times. It is seldom possible to date these monuments even approximately The Berber language was inscribed on stone, often in conjunction with Punic and Latin texts, in a local alphabet which is still current among the Tuaregs (*q.v.*) of the Sahara Beside this backward element there was in historical times an urban population more or less civilized by contact with Greeks and Semites; but it does not appear to have developed a distinctive art Its surviving monuments are mostly sepulchral: most notable are two pyramidal structures near Tipaza (anc. *Tipasa*) and Batna in Algeria. The former, called the Tomb of the Christian Woman (*Kbor er Roumia*), is evidently a royal tomb and perhaps that of Juba II, the philhellene king of Mauretania in the time of Augustus The other, called the Medracen (*Madghasen*), is older, and may be the tomb of Massinissa, the Numidian ally of Rome in their last war with Carthage. Both are low cones of stepped masonry set on cylindrical bases which have cornices borne by engaged columns; their diameters measure about 200 feet. The form may have been derived from the native cairns, but it closely resembles the monumental tumuli of Italy and Asia. The architectural orders are Greek, with some archaisms and other peculiarities that indicate Punic influence.

**Phoenicians.**—The Phoenician settlement, of which Carthage was ultimately the chief city, is assigned to the 12th century B.C, but its earliest known remains are not older than the 7th. At the time of its fall in 146 B.C. Carthage controlled nearly the whole of what is now Tunisia, and was in touch with the native kingdom of Numidia on the west, and through the Phoenician territory of Tripolitania with the Greek colonies of Cyrenaïca on the east.

Nothing is left of the Punic city of Carthage and very little of its Roman successor, the colony which was founded as the capital of Africa after the destruction of the original Carthage. But its site is indicated by a zone of cemeteries, which lay outside the walls. It is a large semicircular area bounded on its short side by the sea; its central point, the modern St. Louis' Hill, was certainly the Punic citadel, the *Byrsa,* and the port was south of this, near the place where two lagoons now lie. These agree perhaps fortuitously with ancient descriptions of the commercial and war harbours, the latter having the Admiralty Island in its midst; but the coast has greatly changed even in the last century, and ancient lines of sea-walls and quays have been identified on the outer coast. The curse that Rome invoked upon the Punic site has operated on its own foundation. After the Arab sack, the city was abandoned by the conquerors, and became a quarry for Mediterranean masons of all later ages. The cathedral of Pisa is said to have been built with stones of Carthage. A few of the larger structures can be traced. On the Byrsa is a temple of Aesculapius; in the western plain, an amphitheatre, on either side of the northern hill, a theatre and an Odeum: in the eastern plain, the baths, better preserved in the Arab name of the locality (*Dermesh*) than in its soil. The waterworks have fared better: there are great vaulted reservoirs at Dermesh and La Malga, fed by an aqueduct from a copious source at Zaghouan, 100 miles away.

The Punic graves that have been found are not older than 700 B.C. They are mostly double chambers approached by shafts; burials were often made in stone coffins with lids carved

as recumbent human figures. There are numerous grotesque clay masks which were placed in the graves to keep evil spirits away. Personal trinkets and jewellery are the other furniture.

In a sanctuary of Baal at Dougga (*Thugga*) birds' bones were buried in jars This temple, which was dedicated to Saturn under Roman rule, was enclosed in a square colonnade. A temple of Tanit-Caelestis at the same city stands in a semicircular court. A mausoleum built there in the 4th century B.C. and recently reconstructed was designed in Graeco-Phoenician style, and bore a bilingual inscription in Libyan and Punic. The art of Carthage was rapidly hellenized, probably by contact with Greek colonies in Sicily rather than [illegible] of Africa.

**Greek.**—The largest Greek city in Africa was Cyrene, one of the greatest cities of the Greek world. Yet its famous and conspicuous site was almost inaccessible until the 20th century. In 1861 two young officers of the British forces at Malta, R Murdoch Smith and E A. Porcher, found and identified the temple of Apollo, sent to England a large series of sculptures, now in the British Museum, and excavated at other points outside and inside the city, but could not stay long enough to explore its topography more definitely. An expedition equipped by the Archaeological Institute of America made a good beginning in 1910, but met with organized hostility among the natives, and before its second season had begun the country was seized by Italy. All archaeological work in Cyrenaïca and Tripolitania has since been directed by the Italian Government. The results at Cyrene show that the Roman city occupied the two hills that are the landmarks of the site The western hill was the Greek acropolis and contained the agora; on the eastern hill is a Doric temple and a stadium; the residential quarters lay in the dividing valley and on the south-west slope of the eastern hill. At the north end of the valley, outside the city wall, the sanctuary of Apollo stands on a partly artificial platform below the fountain, Kyra. The low and narrow channel of this famous spring can be followed for a quarter of a mile inside the mountain; ancient inscriptions are scratched and moulded on the clay that covers its walls, and the mouth of the channel is an open chamber cut in the face of the cliff. Rows of chamber-tombs with elaborate architectural fronts are cut or built in the slopes of the plateau. It seems that the city when fully excavated will be another example of the conventional Roman splendour which is the characteristic element in north African antiquities; but the sanctuary is a new feature, preserving its original plan, and important remains of the Greek structures have been found beneath the Roman ornament. The sanctuary is a walled precinct like that of Delphi. It contains the temples of Apollo and Artemis, each with a great altar in front, and smaller shrines of lesser deities. A curious adjunct of the Artemisium is an underground Nymphaeum, apparently for purificatory rites. The Apollo temple has treasure-cists sunk in its floor. In Roman times two bath-establishments were intruded on the terrace, from one of which some 20 marble statues were recovered, including a headless Aphrodite now in the museum of the Terme at Rome. The rest of the material from Cyrene is at Bengazi. On the west side of the precinct is a Greek theatre. The Sacred Way leads from the sanctuary past the fountain to the agora, a colonnaded area of the usual Roman type containing the provincial *capitolium* and other official buildings. Among the Greek survivals here are the *heroön* and a small circular structure which was the tomb of the first Battos, founder of the city and of the dynasty which ruled it. The round tomb is apparently the base on which stood a column depicted on some Cyrenaïc coins. Curious sepulchral monuments found in the rock-tombs are sculptured busts with heads in which the face was indicated by painting, or with tapering columnar necks instead of heads. Greek art is rare: a few archaic votive statutes have been found and further excavation will doubtless produce others. The archaic strata should also help to determine the origin of the so-called Laconian or Cyrenaïc pottery. (*See* POTTERY AND PORCELAIN: *Greek Pottery.*) A small bronze head of a bearded man (5th century B.C.) has been found by the Italians, and a marble head of Athena (said to be 4th century) was excavated by the American expedition, but the finest work of art from Africa is a Hellenistic bronze head of a young Berber, which was found by Smith and Porcher in the temple of Apollo It is also an anthropological document of great value. There are other Hellenistic pieces among the numerous marble statues from Cyrene, but the sculpture here as in other north African cities is generally of Roman date. The other cities of Cyrenaica have produced Greek terra-cotta statuettes and painted vases, mostly from tombs; among the vases are several oil-jars which were prizes in the Panathenaic games. The Punic colonies must have contained examples of Greek art, and the Mauretanian capital of Juba II. at Cherchel (*Caesarea*) was decorated with imported statuary, some fragments of which survive. Some good examples of Hellenistic sculpture have come from the sea They were found in a sunken ship which was located in 1907 off Mahedia near the Lesser Syrtes, and are now in the museum of the Bardo at Tunis. The most important is a bronze herm signed by Boëthos of Chalchedon. There are many decorative bronzes belonging to furniture, and parts of large marble vases and candelabra in Neo-Attic style. The ship's hold was divided into three compartments, and the deck was laden with marble columns. The date of the wreck is placed in the 2nd century B.C. Two large bronze statuettes, a standing boy and a seated girl, came from the harbour of Bône (*Hippo Regius*) in 1912, and a bronze horseman, said to be of the 5th century B.C., was excavated at Ksar Farun (*Volubilis*) in Morocco.

**Roman.**—Most of the Roman cities are comparatively late foundations. The civilization of Africa was never finished, and its imperial history is a record of continual progress southwards and westwards from the original province to the Sahara and the ocean. Even the older Greek and Carthaginian cities, such as Cyrene and Thugga, and the native capitals of Cirta and Caesarea, were converted to the metropolitan Roman model in the mature imperial age. But the ordinary African township was a mushroom growth, built to an emperor's order and peopled with colonists from the army and the countryside. As the citizens were Romanized by the gift of the Latin name, so the dignity of their city was asserted in its public buildings. Theatres and baths were erected and adorned by the munificence of wealthy Africans, to whom and to Roman landowners and their agents belonged the luxurious villas that are scattered through the country districts. But the urban population in general was meanly housed. The best example of a new city is Timgad (*Thamugadi*) in south-east Algeria (*Numidia*), north of Mt. Aures. It was founded by Trajan as a colony in A.D. 100, and built by military architects and labour from the Legion III. Augusta, whose discharged soldiers were the colonists. The site is laid out on the lines of a military camp, a square cut up into small blocks (*insulae*) by intersecting streets drawn parallel to the enclosing ramparts. A monumental gateway (the so-called triumphal arch of Trajan) stands in the middle of the west side. At the central crossing of the two main streets (*cardo* and *decumanus*) is the *forum,* occupying the space of eight *insulae,* and next to the forum is a theatre. Other public buildings now inside the ramparts are a market-place, a library and baths. The city rapidly outgrew its walls; the later *capitolium,* more baths, a larger market, another triumphal arch, pagan temples and Christian churches were built outside, and as the town grew its formal character was lost. The camp in which the legion itself was permanently quartered is *Lambaesis,* 20m. W. of Timgad. It was established in the first half of the 2nd century, and consists of a fortified square intersected by the two main roads and containing military offices, barracks and baths. A great part of the site is covered by a modern prison. To the south lies the town that attached itself to the legion, entered through monumental arches and equipped with the usual apparatus of capitol and lesser temples, theatres, amphitheatre and baths. Lembaesis is a unique example of a permanent camp. *Cardo* and *decumanus* are paved with stone and bordered with colonnades, and south of their intersection stands nearly to its full height the four-arched entrance to the *praetorium,* leading to a court with porticoes behind which are the headquarters' offices, legionary shrines and armouries.

Other municipal foundations were built on the same model as Timgad, but not always with the formal plan that can only be

achieved on an empty site. The best preserved structures are probably those of Lebda (*Leptis Magna*) in Tripolitania. This was the native city of the emperor Severus, and was magnificently adorned by him. It has been covered by wind-borne sand, which overthrew whole walls with its weight and at the same time buried and protected their ruins. But many walls and columns are still standing with cornices and entablatures intact. At the other end of the Roman dominion, in Morocco, lies Ksar Farun (*Volubilis*) near Meknes, a solitary outpost of classical culture in a barbarous land. A triumphal arch and the remains of a basilica were visible before its excavation. The site was largely cleared by prisoners of war in 1915. Other well-preserved or excavated cities are, in Algeria, Jemila (*Cuicul*), Khamissa (*Thubursicum Numidorum*), and Tipaza (*Tipasa*); in Tunisia, Bou Grara (*Ghighti*), Dougga (*Thugga*), Henchir Kasbat (*Thuburbo Maius*), Medeina (*Althiburus*), and Sbeïtla (*Sufetula*); and Sabratha in Tripolitania. In all of these the usual public places are represented, the *forum* with its *curia, basilica,* and *rostra,* flanked by temples and porticoes which sheltered honorific statues. Khamissa has its table of standard measures still in place; Timgad, Lembaesis, Jemila and Henchir Kasbat have markets appropriately fitted for various commodities. In the military foundations these lie just outside the gates, but Timgad has also smaller and perhaps later markets within the ramparts. There is also a library at Timgad, unique in Africa. Baths and triumphal arches (gateways) abound on these and many other sites, and each city has its theatre; those of Cherchel and Dougga are particularly well preserved. The finest amphitheatre is at El Jem (*Thysdrus*). The official sacred building of a provincial town was the *capitolium,* and was usually placed near the *forum,* but at Timgad it lies outside the walls. The regular tripartite plan is seen in this example. At Dougga the front columns with their pediment are still standing, and at Sbeïtla the capitol consists of three separate shrines. A temple at Tebessa (*Theveste*) is nearly intact, and has an elaborately carved parapet but no pediment. A notable temple is that of Aesculapius at Lembaesis, which has a thermal establishment attached and is approached through an avenue of subsidiary chapels. Many miles of aqueducts are standing between the cities and the springs from which they drew their water. The supply of Carthage came from Zaghouan, where there is an elaborate *Nymphaeum.* Similar water-sanctuaries exist at Hammam Derraji (*Bulla Regia*), Khamissa and elsewhere; the aqueduct at Sbeïtla is carried over the ravine on a massive bridge. Houses of Graeco-Roman design like those of Pompeii have been excavated on many sites: most famous is the House of Sertius at Timgad, but this does not belong to the original city. Bulla Regia has some underground houses, and there are catacombs at Sousse (*Hadrumetum*).

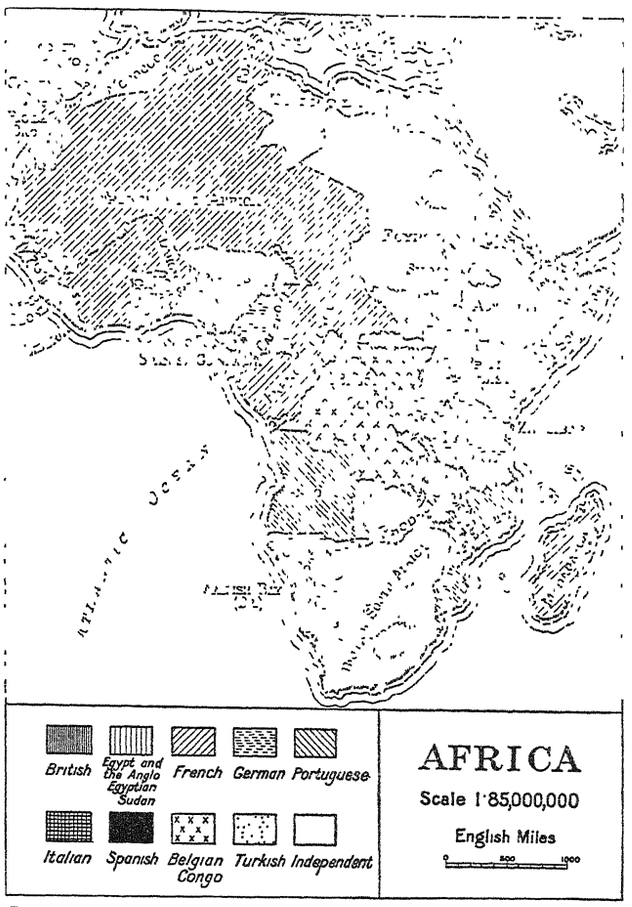
Large quantities of Roman sculpture have been found in these excavations, and are housed in the local museums, among them many imperial portraits and other pieces of historical value. Inscriptions also are abundant. But the peculiar artistic riches of north Africa are mosaic pavements, which have for their subjects, besides decorative patterns, seascapes and landscapes, historical and mythological scenes and incidents of agricultural life, fishing, hunting and games. Among them are portraits of Xenophon from Sbeïtla and Virgil from Sousse. A large and varied series comes from a villa near Zliten in Tripolitania.

**Vandal and Byzantine.**—Mosaic decoration is a prominent feature in the remains of Early Christian churches (basilicas): there are particularly fine examples in the baptisteries of Jemila, Sbeïtla and Timgad. At the last place the church is attached to a monastery, as also at Tebessa. Some of the churches are Late Roman, others are Byzantine foundations. During the short interval of Vandal occupation (AD 439–533) there seems to have been no architectural activity, but some fortification and a good deal of military demolition date from this epoch. Examples of the latter are supplied by the theatres of Carthage, which were filled in with the ruins of their superstructures The great fortress walls that dominate many sites are Byzantine. They were erected to hold the civilized country against native tribes, the same aggressors that the Roman conquerors had to face; and it is significant that the two most imposing Byzantine strongholds, at Haïdra and Tebessa, are on the sites of the first permanent camps that the Roman legion fortified on Mt. Aures (*Ammaedara* and *Theveste*). Haïdra is the type of a military fort, Tebessa of a fortified city. The fortress-walls were made of ancient materials, and often incorporate whole buildings of preceding ages Triumphal arches at Tebessa are worked into the circuit of the ramparts; one at Haïdra was built up to make a tower; the capitols of Dougga and Sbeïtla were turned into forts. The ruin of classical buildings involved in these defensive works was immense, and it has been justly said that the real vandals of north Africa were the Byzantines. Arab conquests, though fatal to town-dwellers, did no great damage to the structures. Indeed their subsequent desertion and neglect have been the means of preserving so many Roman cities to an extent unequalled in any other land. (E. J. F.)

Gauckler, *Les Monuments historiques de la Tunisie* [illegible]tion des Antiquités et Arts); *Musées et Collections archeologiques de l'Algérie et de la Tunisie; Notiziario archeologico del Ministero delle Colonie* and *Africa Italiana* (from 1915, Cyrenaica and Tripolitania).

## HISTORY

The ancient history of Africa is shrouded in mystery and the earliest records of that continent and its people are far from trustworthy. *See* AFRICA, ROMAN; EGYPT.



**Phoenician and Greek Colonization.**—The word Africa was applied originally to the country in the immediate neighbourhood of Carthage, that part of the continent first known to the Romans, and it was subsequently extended with their increasing knowledge. The Arabs still confine the name Ifrikia to the territory of Tunisia. If ancient Egypt and Ethiopia (*q.v.*) be excluded, the story of Africa is largely a record of the doings of its Asiatic and European conquerors and colonizers, Abyssinia being the only State which throughout historic times has maintained its independence. The countries bordering the Mediterranean were first exploited by the Phoenicians. Carthage, founded about 800 B.C., speedily grew into a city without rival in the Mediterranean, and the Phoenicians, subduing the Berber tribes, who then, as now, formed the bulk of the population, became masters of all the habitable region of north Africa west of the Great Syrtis. Both Egyptians and Carthaginians made attempts to reach the unknown parts of the continent by sea. The west coast was well known to the Phoenicians as far as Cape Nun, and *c.* 520 B.C. Hanno, a Carthaginian, explored the coast at least as far as Sierra Leone.

A WOMAN OF ZULULAND

Meantime the first European colonists had settled in Africa. Greeks founded the city of Cyrene (*c.* 631 B.C.) and exerted a powerful influence in Egypt. To Alexander the Great the city of Alexandria owes its foundation (332 B.C.), and under the Hellenistic dynasty of the Ptolemies attempts were made to penetrate southward, and in this way was obtained some knowledge of Abyssinia. Neither Cyrenaica nor Egypt was a serious rival to the Carthaginians, but all three Powers were eventually supplanted by the Romans after the fall of Carthage in 146 B.C. Under Rome the settled portions of the country were very prosperous, and a Latin strain was introduced into the land. Though Fezzan was occupied by them, the Romans elsewhere found the Sahara an impassable barrier. The utmost extent of geographical knowledge of the continent is shown in the writings of Ptolemy (2nd century A.D.), who guessed the existence of the great lake reservoirs of the Nile and had heard of the river Niger. (For the history of Africa under the empire, *see* ROMAN EMPIRE, LATER.)

**The Arab Conquest.**—In the 7th century an Arab host, following the new faith of Mohammed, conquered the whole country from the Red sea to the Atlantic and entered Spain. Throughout north Africa Christianity well-nigh disappeared, save in Egypt (where the Coptic Church was suffered to exist), and Upper Nubia and Abyssinia, which were not subdued In the 8th, 9th and 10th centuries the Arabs in Africa were numerically weak; but in the

POLITICAL DIVISIONS OF AFRICA IN 1910 AT THE CLOSE OF THE FINAL PHASE OF THE INTERNATIONAL "SCRAMBLE FOR TERRITORY"
Two further adjustments took place before the World War. By the 1911 agreement the Cameroon received two tongue-like extensions—one reaching to the Congo river, the other to the Ubangi. On Nov. 5, 1911, as the result of a brief war with Turkey, Italian sovereignty was extended over Tripoli

11th century there was a great Arab immigration. Even before this the Berbers had very generally adopted the speech and religion of their conquerors. Arab influence and the Mohammedan religion thus became indelibly stamped on northern Africa. Together they spread southward across the Sahara, and became firmly established along the eastern sea-board, where Arabs, Persians and Indians planted flourishing maritime and commercial colonies. Of these eastern cities and States both Europe and the Arabs of north Africa were long ignorant.

The first Arab invaders had recognized the authority of the caliphs of Baghdad. Early in the 10th century the Fatimite dynasty established itself in Egypt, where Cairo had been founded A.D. 968, and from there ruled as far west as the Atlantic. Later still arose other dynasties such as the Almoravides and Almohades. Eventually the Turks, who had seized Egypt in 1517, established the regencies of Algeria, Tunisia and Tripoli (between 1519 and 1551), Morocco remaining an independent Arabized Berber State under the Sharifan dynasty, which had its beginnings at the end of the 13th century. Under the earlier dynasties the spirit of adventure and the proselytizing zeal of the followers of Islam led to a considerable extension of the knowledge of the continent. This was rendered more easy by their use of the camel, which enabled the Arabs to traverse the desert. In this way Senegambia and the middle Niger regions fell under the influence of the Arabs and Berbers, but it was not until 1591 that Timbuktu—founded in the 11th century—became Muslim. That city had been reached in 1352 by the great Arab traveller Ibn Batuta, to whose journey to Mombasa and Quiloa (Kilwa) was due the first accurate knowledge of those flourishing Muslim cities on the east African sea-board. Except along this sea-board, which was colonized directly from Asia, Arab progress southward was stopped by the broad belt of dense forest which, stretching almost across the continent somewhat south of 10° N., barred their advance as effectually as had the Sahara that of their predecessors, and cut them off from knowledge of the Guinea coast and of all Africa beyond. One of the regions which came latest under Arab control was Nubia, where a Christian civilization and State existed up to the 14th century

For a time the Muslim conquests in south Europe had virtually made of the Mediterranean an Arab lake, but in the 11th century the Norman conquest of Sicily was followed by their descent on Tunisia and Tripoli Somewhat later a busy trade with the African coast-lands, especially Egypt, was developed by the cities of north Italy. The Italians also, in the 14th and 15th centuries, traded with the countries of the Niger bend and were conversant with the routes across the Sahara Some Europeans even traversed the desert, while one traveller—not a merchant—the Frenchman Anselme d'Isalguier reached Gao on the Niger, in 1405.[1] Meanwhile events were impending which were to have a profound effect on north-west Africa. By the end of the 15th century Spain had completely thrown off the Muslim yoke, but even while the Moors were still in Granada, Portugal was strong enough to carry the war into Africa. In 1415 a Portuguese force captured the citadel of Ceuta on the Moorish coast. From that time Portugal repeatedly interfered in the affairs of Morocco, while Spain acquired many ports in Algeria and Tunisia. Portugal, however, suffered a crushing defeat in 1578 at al Kasr al Kebir, the Moors being led by Abd el Malek I. of the Sherifan dynasty. By that time the Spaniards had lost almost all their African possessions. The Barbary States degenerated into mere communities of pirates, and under Turkish influence civilization and commerce declined. (X.)

## MODERN HISTORY

**The Portuguese.**—But with the battle of Ceuta, Africa had ceased to belong solely to the Mediterranean world. Among those who fought there was Prince Henry "the Navigator," son of King John I., who was fired with the ambition to acquire for Portugal the unknown parts of Africa. Under his inspiration and direction was begun that series of voyages of exploration which resulted in the circumnavigation of Africa and the establishment of Portuguese sovereignty over large areas of the coast-lands. Cape Bojador was doubled in 1434, Cape Verde in 1445, and by 1480 the whole Guinea coast was known. In 1482 Diogo Cam or Cão discovered the mouth of the Congo; the Cape of Good Hope was doubled by Bartholomew Diaz in 1488, and in 1498 Vasco da Gama, after having rounded the Cape, sailed up the east coast, touched at Sofala and Malindi, and went thence to India. Over all the countries discovered by their navigators Portugal claimed sovereign rights, but these were not exercised in the extreme south of the continent. The Guinea coast, as the first discovered and the nearest to Europe, was first exploited. Numerous forts and trading stations were established, the earliest being São Jorge da Mina (Elmina), begun in 1482. The chief commodities dealt in were slaves, gold, ivory and spices. The discovery of America (1492) was followed by a great development of the slave trade, which, before the Portuguese era, had been an overland trade almost exclusively confined to Mohammedan Africa. The lucrative nature of this trade, and the large quantities of alluvial gold obtained by the Portuguese, drew other nations to the Guinea coast English mariners went thither as early as 1553, and they were followed by Spaniards, Dutch, French, Danish, and

[1] D'Isalguier afterwards wrote an account (never published) of his travels, which were made known in 1927 by Charles de la Roncière in vol. iii. of *La Découverte de l'Afrique au Moyen Âge.*

other adventurers. Much of Senegambia was made known as a result of quests during the 16th century for the "hills of gold" in Bambuk and the fabled wealth of Timbuktu, but the middle Niger was not reached. The supremacy along the coast passed in the 17th century from Portugal to Holland and from Holland in the 18th and 19th centuries to France and England. The whole coast from Senegal to Lagos was dotted with forts and "factories" of rival Powers, and this international patchwork persists though all the *hinterland* has become either French or British territory.

Southward from the mouth of the Congo[1] to the inhospitable region of Damaraland, the Portuguese, from 1491 onward, acquired influence over the Bantu-Negro inhabitants, and in the early part of the 16th century through their efforts Christianity was largely adopted in the native kingdom of Congo. An irruption of cannibals from the interior later in the same century broke the power of this semi-Christian state, and the Portuguese activity was transferred to a great extent farther south, São Paulo de Loanda being founded in 1576. The sovereignty of Portugal over this coast region, except for the mouth of the Congo, has been only once challenged by a European Power, and that was in 1640–48, when the Dutch held the seaports.

Neglecting the comparatively poor and thinly inhabitated regions of South Africa, the Portuguese no sooner discovered than they coveted the flourishing cities held by Arabized peoples between Sofala and Cape Guardafui. By 1520 all these Muslim sultanates had been seized by Portugal, Mozambique being chosen as the chief city of her East African possessions. Nor was Portuguese activity confined to the coast-lands. The lower and middle Zambezi valley was explored (16th and 17th centuries), and here the Portuguese found semi-civilized Bantu-Negro tribes, who had been for many years in contact with the coast Arabs. Strenuous efforts were made to obtain possession of the country (modern Rhodesia) known to them as the kingdom or empire of Monomotapa, where gold had been worked by the natives from about the 12th century A.D., and whence the Arabs, whom the Portuguese dispossessed, were still obtaining supplies in the 16th century. Several expeditions were despatched inland from 1569 onward and considerable quantities of gold were obtained. Portugal's hold on the interior, never very effective, weakened during the 17th century, and in the middle of the 18th century ceased with the abandonment of the forts in the Manica district.

At the period of her greatest power Portugal exercised a strong influence in Abyssinia also. In the ruler of Abyssinia (to whose dominions a Portuguese traveller had penetrated before Vasco da Gama's memorable voyage) the Portuguese imagined they had found the legendary Christian king, Prester John, and when the complete overthrow of the native dynasty and the Christian religion was imminent by the victories of Mohammedan invaders, the exploits of a band of 400 Portuguese under Christopher da Gama during 1541–43 turned the scale in favour of Abyssinia and had thus an enduring result on the future of north-east Africa. After da Gama's time Portuguese Jesuits resorted to Abyssinia. While they failed in their efforts to convert the Abyssinians to Roman Catholicism they acquired an extensive knowledge of the country. Pedro Paez in 1615, and, ten years later, Jeronimo Lobo, both visited the sources of the Blue Nile. In 1663 the Portuguese, who had outstayed their welcome, were expelled from the Abyssinian dominions. At this time Portuguese influence on the Zanzibar coast was waning before the power of the Arabs of Muscat, and by 1730 no point on the east coast north of Cape Delgado was held by Portugal.

**The English and the Dutch.**—It has been seen that Portugal took no steps to acquire the southern part of the continent. To the Portuguese the Cape of Good Hope was simply a landmark on the road to India, and mariners of other nations who followed in their wake used Table Bay only as a convenient spot wherein to refit on their voyage to the East. By the beginning of the 17th century the bay was much resorted to for this purpose, chiefly by English and Dutch vessels. In 1620, with the object of forestalling the Dutch, two officers of the East India Company, on their own initiative, took possession of Table Bay in the name of King James, fearing otherwise that English ships would be "frustrated of watering but by licence." Their action was not approved in London, and the proclamation they issued remained without effect. The Netherlands profited by the apathy of the English. On the advice of sailors who had been shipwrecked in Table Bay the Netherlands East India Company, in 1651, sent out a fleet of three small vessels under Jan van Riebeek which reached Table Bay on April 6, 1652, when, 164 years after its discovery, the first permanent white settlement was made in South Africa. The Portuguese, whose power in Africa was already waning, were not in a position to interfere with the Dutch plans, and England was content to seize the island of St. Helena as her half-way house to the East.[1] In its inception the settlement at the Cape was not intended to become an African colony, but was regarded as the most westerly outpost of the Dutch East Indies. Nevertheless, despite the paucity of ports and the absence of navigable rivers, the Dutch colonists, freed from any apprehension of European trouble by the friendship between Great Britain and Holland and leavened by Huguenot blood, gradually spread eastward.

[1]This river was called by the Portuguese the Zaire. They appear to have made no attempt to trace its course beyond the rapids which stop navigation from the sea.

### MODERN EXPLORATION

During the 18th century there is little to record in the history of Africa. The nations of Europe, engaged in the later half of the century in almost constant warfare and struggling for supremacy in America and the East, to a large extent lost their interest in the continent. Only on the west coast was there keen rivalry, and here the motive was the securance of trade rather than territorial acquisitions. In this century the slave trade reached its highest development, the trade in gold, ivory, gum, and spices being small in comparison. In the interior of the continent—Portugal's energy being expended—no interest was shown, the nations with establishments on the coast "taking no further notice of the inhabitants or their land than to obtain at the easiest rate what they procure with as little trouble as possible, or to carry them off for slaves to their plantations in America" (*Encyclopædia Britannica*, 3rd. ed. 1797). Even the scanty knowledge acquired by the ancients and the Arabs was in the main forgotten or disbelieved. It was the period when—

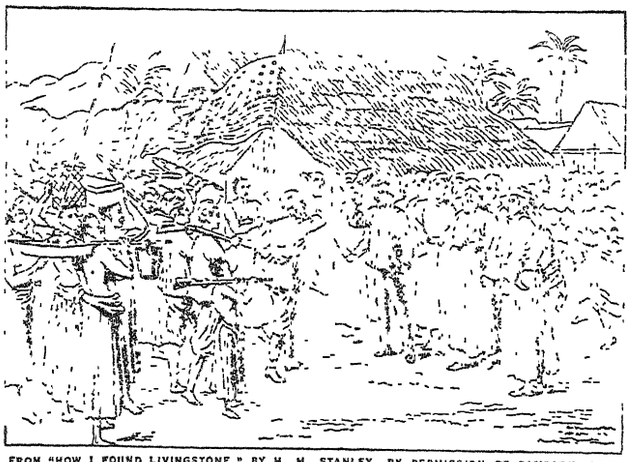
> Geographers, in Afric maps,
> With savage pictures filled their gaps,
> And o'er inhabitable downs
> Placed elephants for want of towns.
>
> (*Poetry, a Rhapsody*. By Jonathan Swift.)

The prevailing ignorance may be gauged by the statement in the third edition of the *Encyclopædia Britannica* that "the Gambia and Senegal rivers are only branches of the Niger." But the closing years of the 18th century, which witnessed the partial awakening of the public conscience of Europe to the iniquities of the slave trade, were also notable for the revival of interest in inner Africa. A society, the African Association,[2] was formed in London in 1788 for the exploration of the interior of the continent. The era of great discoveries had begun a little earlier in the famous journey (1770–72) of James Bruce through Abyssinia and Sennar, during which he determined the course of the Blue Nile. But it was through the agents of the African Association that knowledge was gained of the Niger regions. The Niger was reached by Mungo Park, who travelled by way of the Gambia, in 1795. Park, on a second journey in 1805, passed Timbuktu and descended the Niger to Bussa, where he lost his life, having just failed to solve the question as to where the river reached the ocean. (This problem was ultimately solved by Richard Lander and his brother in 1830.) The first scientific explorer of South-East Africa, Dr. Francisco de Lacerda, a Portu-

[1]France acquired, as stations for her ships on the voyage to and from India, settlements in Madagascar and the neighbouring islands. The first settlement was made in 1642.

[2]The Association, in 1831, was merged in the Royal Geographical Society.

guese, also lost his life in that country. Lacerda travelled up the Zambezi to Tete, going thence towards Lake Mweru, near which he died in 1798. The first recorded crossing of Africa was accomplished between the years 1802 and 1811 by two half-caste Portuguese traders, Pedro Baptista and A. José, who passed from Angola eastward to the Zambezi.



Although the Napoleonic wars distracted the attention of Europe from exploratory work in Africa, those wars nevertheless exercised great influence on the future of the continent, in both Egypt and South Africa. The occupation of Egypt (1798–1803) first by France and then by Great Britain, resulted in an effort by Turkey to regain direct control over that country,[1] followed in 1811 by the establishment, under Mohammed Ali, of an almost independent state, and the extension of Egyptian rule over the eastern Sudan (from 1820 onward). In South Africa the struggle with Napoleon caused Great Britain to take possession of the Dutch settlements at the Cape, and in 1814 Cape Colony, which had been continuously occupied by British troops since 1806, was formally ceded to the British crown.

The close of the European conflicts with the battle of Waterloo was followed by vigorous efforts on the part of the British Government to become better acquainted with Africa, and to substitute colonization and legitimate trade for the slave traffic, declared illegal for British subjects in 1807 and abolished by all other European Powers by 1836. To West Africa Britain devoted much attention. The slave trade abolitionists had already, in 1788, formed a settlement at Sierra Leone, on the Guinea coast, for freed slaves, and from this establishment grew the colony of Sierra Leone,[2] long notorious, by reason of its deadly climate, as "The White Man's Grave." Farther east the establishments on the Gold Coast began to take a part in the politics of the interior, and the first British mission to Kumasi, despatched in 1817, led to the assumption of a protectorate over the maritime tribes heretofore governed by the Ashanti.

An expedition sent in 1816 to explore the Congo from its mouth did not succeed in getting beyond the rapids which bar the way to the interior, but in the central Sudan much better results were obtained. In 1823 three English travellers, Walter Oudney, Dixon Denham, and Hugh Clapperton, reached Lake Chad from Tripoli—the first white men to reach that lake. The partial exploration of Bornu and the Hausa states by Clapperton, which followed, revealed the existence of large and flourishing cities and a semi-civilized people in a region hitherto unknown. The discovery in 1830 of the mouth of the Niger by Clapperton's servant, Lander, already mentioned, had been preceded by the journeys of Maj. A. G. Laing (1826) and René Caillié (1827) to Timbuktu, and was followed (1832–33) by the partial ascent of the Benue affluent of the Niger by MacGregor Laird. In 1841 a disastrous attempt was made to plant a white colony on the lower Niger, an expedition (largely philanthropic and anti-slavery in its inception) which ended in utter failure. Nevertheless, from that time British traders remained on the lower Niger, their continued presence leading ultimately to the acquisition of political rights over the delta and the Hausa states by Great Britain.[3] Another endeavour by the British Government to open up commercial relations with the Niger countries resulted in the addition of a vast amount of information concerning the countries between Timbuktu and Lake Chad, owing to the labours of Heinrich Barth (1850–55), originally a subordinate, but the only surviving member of the expedition sent out.

Meantime considerable changes had been made in other parts of the continent, the most notable being the occupation of Algiers by France in 1830, an end being thereby put to the piratical proceedings of the Barbary States; the continued expansion southward of Egyptian authority, with the consequent additions to the knowledge of the Nile; and the establishment of independent states (Orange Free State and the Transvaal) by Dutch farmers (Boers) dissatisfied with British rule in Cape Colony Natal, so named by Vasco da Gama, had been made a British colony (1843), the attempt of the Boers to acquire it being frustrated. The city of Zanzibar, on the island of that name, founded in 1832 by Seyyid Said of Muscat, rapidly attained importance, and Arabs began to penetrate to the great lakes of East Africa,[1] concerning which little more was known (and less believed) than in the time of Ptolemy. Accounts of a vast inland sea, and the discovery in 1848–49, by the missionaries Ludwig Krapf and J Rebmann, of the snow-clad mountains of Kilimanjaro and Kenya, stimulated in Europe the desire for further knowledge.

**Livingstone and Stanley.**—At this period, the middle of the 19th century, Protestant missions were carrying on active propaganda on the Guinea coast, in South Africa, and in the Zanzibar dominions. Their work, largely beneficent, was being conducted in regions and among peoples little known, and in many instances missionaries turned explorers and became pioneers of trade and empire. One of the first to attempt to fill up the remaining blank spaces in the map was David Livingstone, who had been engaged since 1840 in missionary work north of the Orange In 1849 Livingstone crossed the Kalahari desert from south to north and reached Lake Ngami, and between 1851 and 1856 he traversed the continent from west to east, making known the great waterways of the upper Zambezi During these journeyings Livingstone discovered, Nov. 1855, the famous Victoria Falls, so named after the queen of Great Britain. In 1858–64 the lower Zambezi, Shiré, and Lake Nyasa were explored by Livingstone, Nyasa having been first reached by the confidential slave of Antonio da Silva Porto, a Portuguese trader established at Bihé in Angola, who crossed Africa during 1853–56 from Benguella to the mouth of the Rovuma While Livingstone circumnavigated Nyasa, the more northerly lake, Tanganyika, had been visited (1858) by Richard Burton and J H Speke, and the last named had sighted Victoria Nyanza Returning to East Africa with J. A. Grant, Speke reached, in 1862, the river which flowed from Victoria

FROM "HOW I FOUND LIVINGSTONE," BY H. M. STANLEY, BY PERMISSION OF SAMPSON, LOW, MARSTON & CO., LTD., AND OF CHARLES SCRIBNER S SONS

**STANLEY GREETS LIVINGSTONE WITH "DR. LIVINGSTONE, I PRESUME" After a hazardous journey of 295 days Stanley, on Nov. 10, 1871, reached Ujiji, where he found Dr. Livingstone, sick, emaciated and depressed**

Nyanza and, following it (in the main) down to Egypt, had the distinction of being the first man to read the riddle of the Nile. In 1864 another Nile explorer, Samuel Baker, discovered the Albert Nyanza, the chief western reservoir of the river. In 1866 Livingstone began his last great journey, in which he made known Lakes Mweru and Bangweulu and discovered the Lualaba (the upper part of the Congo), but died (1873) before he had been able to demonstrate its ultimate course, believing indeed that the Lualaba belonged to the Nile system. Livingstone's lonely death in the heart of Africa evoked a keener desire than ever to complete the work he left undone. H. M. Stanley, who had in 1871

[1]The Mamelukes, whom the Turks had overthrown in the 16th century, had regained practically independent power.

[2]In imitation of the British example, an American society founded in 1822 the negro colony (now republic) of Liberia.

[3]The first territorial acquisition made by Great Britain in this region was in 1851, when Lagos Island was annexed.

[1]As early as 1848 an Arab from Zanzibar journeying across the continent had arrived at Benguella.

succeeded in finding and succouring Livingstone, started again for Zanzibar in 1874, and in the most memorable of all exploring expeditions in Africa circumnavigated Victoria Nyanza and Tanganyika, and, striking farther inland to the Lualaba, followed that river down to the Atlantic ocean—reached in Aug. 1877—and proved it to be the Congo. In South Africa, Karl Mauch in 1871 discovered the ruins of the great Zimbabwe in Mashonaland, and in the following year F. C. Selous began his journeys over South Central Africa.

Explorers were active also in other parts of the continent. Southern Morocco, the Sahara, and the Sudan were traversed in many directions between 1860 and 1875 by Gerhard Rohlfs, Georg Schweinfurth and Gustav Nachtigal. These travellers not only added considerably to geographical knowledge, but obtained invaluable information concerning the people, languages, and natural history of the countries in which they sojourned [1] Among the discoveries of Schweinfurth was one that confirmed the Greek legends of the existence beyond Egypt of a pygmy race. But the first discoverer of the dwarf races of Central Africa was Paul du Chaillu, who found them in the Ogowé district of the west coast in 1865, five years before Schweinfurth's first meeting with the pygmies; du Chaillu having previously, as the result of journeys in the Gabun country between 1855 and 1859, made popular in Europe the knowledge of the existence of the gorilla, perhaps the gigantic ape seen by Hanno the Carthaginian, and whose existence, up to the middle of the 19th century, was thought to be as legendary as that of the pygmies of Aristotle.

Stanley's great journey down the Congo in 1875–76 initiated a new era in African exploration, and since 1875 the map has been filled with authentic topographical details. Within their respective spheres of influence each Power undertook detailed surveys, and the most solid of the latest accessions to knowledge have resulted from the labours of hard-working colonial officials toiling individually in obscurity.

In 1877 an important expedition was sent out by the Portuguese Government under Serpa Pinto, Brito Capello, and Roberto Ivens for the exploration of the interior of Angola. The first named made his way by the head-streams of the Kubango to the upper Zambezi, which he descended to the Victoria Falls, proceeding thence to Pretoria and Durban. Capello and Ivens confined their attention to the south-west Congo basin, where they disproved the existence of Lake Aquilunda, which had figured on the maps of that region since the 16th century. In a later journey (1884–85) Capello and Ivens crossed the continent from Mossamedes to the mouth of the Zambezi adding considerably to the knowledge of the borderlands between the upper Congo and the upper Zambezi. More important results were obtained by the German travellers, Paul Pogge and Hermann von Wissmann, who (1880–82) passed through previously unknown regions beyond Muata Yanvo's kingdom, and reached the upper Congo at Nyangwe, whence Wissmann made his way to the east coast. In 1884–85 a German expedition under Wissmann solved the most important geographical problem relating to the southern Congo basin by descending the Kasai, the largest southern tributary, which contrary to expectation proved to unite with the Kwango and other streams before joining the main river. Further additions to the knowledge of the Congo tributaries were made at the same time by the Rev. George Grenfell, a Baptist missionary, who (accompanied in 1885 by K. von François) made several voyages in the steamer "Peace," especially up the great Ubangi, ultimately proved to be the lower course of the Welle, discovered in 1870 by Schweinfurth.

**East Africa.**—The first new journey of importance in East Africa was made (1878–80) on behalf of the British African Exploration committee by Joseph Thomson, who after the death of his leader, Keith Johnston, made his way from the coast to the north end of Nyasa, thence to Tanganyika, on both sides of which he broke new ground, sighting the north end of Lake Rukwa on the east In 1882–84 the French naval lieutenant, Victor Giraud, proceeded by the north of Nyasa to Lake Bangweulu, of which he made the first fairly correct map. North of the Zanzibar-Tanganyika route a large area of new ground was opened in 1883–84 by Thomson, who traversed the whole length of the Masai country to Lake Baringo and Victoria Nyanza, shedding the first clear light on the great East African rift-valley and neighbouring highlands, including Mts. Kenya and Elgon. A great advance in the region between Victoria Nyanza and Abyssinia was made in 1887–89 by the Austrians, Count Samuel Teleki and Lieut. Ludwig von Höhnel, who discovered the large Basso Norok, now known as Lake Rudolf, till then only vaguely indicated on the map as Samburu At this time Somaliland was being opened up by English and Italian travellers. In 1883 the brothers F. L. and W. D. James penetrated from Berbera to the Webi Shebeli; in 1892 Vittorio Bottego (afterwards murdered in the Abyssinian highlands) started from Berbera and reached the upper Juba, which he explored to its source. The first person to cross from the Gulf of Aden to the Indian Ocean was an American, A. Donaldson Smith, who in 1894–95 explored the head-streams of the Webi Shebeli and also explored the Omo, the feeder of Lake Rudolf.

In the region north-west of Victoria Nyanza the greatest additions to geographical knowledge were made by H. M. Stanley in his last expedition, undertaken for the relief of Emin Pasha. The expedition set out in 1887 by way of the Congo and made its way, encountering immense difficulties, through the great equatorial forest, the character and extent of which were thus for the first time brought to light. The return was made to the east coast and resulted in the discovery of the great snowy range of Ruwenzori or Runsoro, and the confirmation of the existence of a third Nile lake discharging its waters into the Albert Nyanza by the Semliki river.

**North and West Africa.**—Great activity was also displayed in completing the work of earlier explorers in North and West Africa. Morocco was in 1883–84 the scene of important explorations by de Foucauld, a Frenchman who, disguised as a Jew, crossed and re-crossed the Atlas and supplied the first trustworthy information as to the orography of many parts of the chain. In 1887–89 Louis Gustave Binger, a French officer, made a great journey through the countries enclosed in the Niger bend, and in 1890–92 Col. P. F. Monteil went from St. Louis to Say, on the Niger, thence through Sokoto to Bornu and Lake Chad, whence he crossed the Sahara to Tripoli. Meantime explorers had been busy in the region between Lake Chad, the Gulf of Guinea, and the Congo. The Sanga, one of the principal northern tributaries of the Congo, was reached from the north by Lieut. Louis Mizon, a French naval officer, who drew the first line of communication between the Benue and the Congo (1890–92). In 1890 Paul Crampel, who in the previous year had explored north of the Ogowé, undertook a great expedition from the Ubangi to the Shari, but was attacked and killed, with several of his companions, on the borders of the Bagirmi. Several other expeditions followed, and in 1896 Emile Gentil reached the Shari, launched a steamer on its waters and pushed on to Lake Chad. Early in 1900 Lake Chad was also reached by F. Foureau, a French traveller, who had already devoted 12 years to the exploration of the Sahara, and who on this occasion had crossed the desert from Algeria and had reached the lake *via* Air and Zinder.

**Equatorial Africa.**—The last ten years of the 19th century also witnessed many interesting expeditions in east Central Africa. In 1891 Emin Pasha, accompanied by Dr. F. Stuhlmann, made his way south of Victoria Nyanza to the western Nile lakes, visiting for the first time the southern and western shores of Albert Edward. Stuhlmann also ascended the Ruwenzori range to a height of over 13,000 feet. In the same year Dr. O. Baumann, who had already done good work in Usambara, near the coast, started on a more extended journey through the region of steppes between Kilimanjaro and Victoria Nyanza, afterwards exploring the head-streams of the Kagera, the ultimate sources of the Nile. In the steppe region referred to he discovered two new lakes, Manyara and Eiassi, occupying parts of the East African valley system This region was again traversed in 1893–94 by Count von Götzen, who continued his route westwards to Lake

[1] Another great traveller of this stamp was Wilhelm Junker, who spent the greater part of the period 1875–86 in the east central Sudan.

Kivu, north of Tanganyika, which, though heard of by Speke over 30 years before, had never yet been visited. He also reached for the first time the line of volcanic peaks north of Kivu, one of which he ascended, afterwards crossing the great equatorial forest by a new route to the Congo and the west coast. Valuable scientific work was done in 1893 by Dr. J. W. Gregory, who ascended Mt. Kenya to a height of 16,000 feet. In 1893–94 Scott Elliot reached Ruwenzori by way of Uganda, returning by Tanganyika and Nyasa, and in 1896 C. W. Hobley made the circuit of the great mountain Elgon, north-east of Victoria Nyanza. In 1890 Mt. Kenya was ascended to its summit by a party under H. J. Mackinder. The exploration of Mt. Kilimanjaro has been the special work of Dr. Hans Meyer, who first directed his attention to it in 1887. The region south of Abyssinia proper and north of Lake Rudolf, being largely the basin of the Sobat tributary of the Nile, was traversed by several explorers, among whom may be mentioned Capt. M. S. Wellby, who in 1898–99 explored the chain of small lakes in south-east Abyssinia, pushed on to Lake Rudolf, and thence traversed hitherto unknown country to the lower Sobat. Other valuable expeditions of exploration and surveying were conducted by Donaldson Smith (1899–1900), Maj. H. H. Austin (1899–1901), Maj. A. St. H. Gibbons (1895–96, 1898–1900), Commander B. Whitehouse (1904–06), Lieut. Boyd Alexander, Sir H. H. Johnston, Maj. Powell-Cotton, and the duke of Abruzzi

The first journey through the whole length of the continent was accomplished in the last two years of the century when a young Englishman, E. S. Grogan, starting from Cape Town, reached the Mediterranean by way of the Zambezi, the central line of lakes and the Nile. Other travellers followed in Grogan's footsteps, among the first Maj. Gibbons.

Additions to topographical knowledge were made from about 1890 onwards by the international commissions which traced the frontiers of the protectorates of the European powers. The Anglo-French commission in 1903 traced the Nigerian frontier from the Niger to Lake Chad, and in 1903–04 the Anglo-German commission fixed the Cameroon boundary between Yola, on the Benue, and Lake Chad. In 1901–02 a German Congolese commission surveyed Lake Kivu and the volcanic region north of the lake, while the Anglo-German boundary commission of 1902–04 surveyed the valley of the lower Kagera and fixed the exact position of Albert Edward Nyanza.

At the same time administrative needs forced the governments concerned to take in hand the survey of the countries under their protection. Before the close of the first decade of the 20th century tolerably accurate maps had been made of the German colonies, of a considerable part of West Africa, the Algerian Sahara, and the Anglo-Egyptian Sudan, mainly by military officers.

## PARTITION AMONG EUROPEAN POWERS

In the last quarter of the 19th century the map of Africa was transformed. After the discovery of the Congo the story of exploration takes second place; the continent becomes the theatre of European expansions. Lines of partition, drawn often through trackless wildernesses, marked out the possessions of Germany, France, Great Britain, and other Powers. Railways penetrated the interior, vast areas were opened up to civilized occupation, and from ancient Egypt to the Zambezi the continent was startled into new life.

Before 1875 the only European Powers with any considerable interest in Africa were Britain, Portugal, and France.

In North Africa the Turks had (in 1835) assumed direct control of Tripoli, while Morocco had fallen into a state of decay though retaining its independence. A remarkable change had taken place in Egypt, where the Khedive Ismail had introduced a somewhat fantastic imitation of European civilization. In addition Ismail had conquered Darfur, annexed Harar and the Somali ports on the Gulf of Aden, was extending his power southward to the equatorial lakes, and even contemplated reaching the Indian ocean. The Suez canal, opened in 1869, had a great influence on the future of Africa, as it again made Egypt the highway to the East, to the detriment of the Cape route.

In 1875 other European nations—with the occasional exception of Great Britain—were indifferent to Portugal's pretensions, and her estimate of her African empire as covering over 700,000sq m. was not challenged But the area under effective control of Portugal at that time did not exceed 40,000 sq. miles. Great Britain then held some 250,000sq m., France about 170,000sq m, and Spain 1,000sq. miles. The total area of Africa ruled by Europeans did not exceed 1,271,000sq m.; roughly one-tenth of the continent.

Egypt and the Egyptian Sudan, Tunisia, and Tripoli were subject in differing ways to the overlordship of the sultan of Turkey, and with these may be ranked, in the scale of organized governments, the three principal independent states, Morocco, Abyssinia, and Zanzibar, as also the negro republic of Liberia There remained, apart from the Sahara, roughly one-half of Africa, lying mostly within the tropics, inhabited by a multitude of tribes and peoples living under various forms of government and subject to frequent changes in respect of political organization In the whole of this vast region the negro and Negro-Bantu races predominated, for the most part untouched by Mohammedanism or Christian influences. The larger States and Sultanates possessed neither the means nor the inclination to extend their influence beyond their own borders. The exploitation of Africa continued to be entirely the work of alien races.

**Leopold II.**—The causes which led to the partition of Africa are to be found in the economic and political state of western Europe at the time. Germany, strong and united as the result of the Franco-Prussian War of 1870, was seeking new outlets for her energies—new markets for her growing industries, and with the markets, colonies. For different reasons the war of 1870 was also the starting-point for France in the building up of a new colonial empire. In her endeavour to regain the position lost in that war France had to look beyond Europe. To the two causes mentioned must be added others. Great Britain and Portugal, when they found their interests threatened, bestirred themselves, while Italy also conceived it necessary to become an African Power. The struggle was not, however, precipitated by the action of any of the great Powers but by the ambitious projects of Leopold II., king of the Belgians, who, in Sept. 1876, took what may be described as the first definite step in the modern partition of the continent. He summoned to a conference at Brussels representatives of Great Britain, Belgium, France, Germany, Austria-Hungary, Italy, and Russia, to deliberate on the best methods to be adopted for the exploration and civilization of Africa, and the opening up of the interior of the continent to commerce and industry. The conference was entirely unofficial. The delegates who attended neither represented nor pledged their respective governments. Their deliberations lasted three days and resulted in the foundation of "The International African Association," with its headquarters at Brussels. It was further resolved to establish national committees in the various countries represented, which should collect funds and appoint delegates to the International Association. The central idea appears to have been to put the exploration and development of Africa upon an international footing. But it quickly became apparent that this was an unattainable ideal The national committees were soon working independently of the International Association, and the association itself passed through a succession of stages until it became purely Belgian in character, and at last developed into the Congo Free State, under the personal sovereignty of King Leopold.

Stanley's journey down the Congo had stirred ambition in other capitals than Brussels. France had always taken a keen interest in West Africa, and in the years 1875 to 1878 Savorgnan de Brazza had carried out a successful exploration of the Ogowe river to the south of the Gabun. In Portugal, too, the discovery of the Congo, with its magnificent unbroken waterway of more than a thousand miles into the heart of the continent, served to revive the languid energies of the Portuguese, who promptly began to furbish up claims whose age was in inverse ratio to their validity In Jan. 1879 Stanley left Europe as the accredited agent of King Leopold and the Congo committee. De Brazza returned to Africa at the beginning of 1880, and while Stanley,

on behalf of King Leopold, was making treaties and founding stations along the southern bank of the river, de Brazza and other French agents were equally busy on the northern bank.

**The Scramble for Territory.**—Although the Transvaal between the years 1877 and 1881 had become and ceased to be British, in other respects British territory had been extended in South Africa. And in 1883, in order that the trade route to the interior might be kept open for British expansion northward from the Cape Colony, negotiations for the settlement of the western border of the restored republic were opened in London The border was defined in the Convention of London (Feb. 27, 1884), and at the same time the Bechuana peoples were taken under British protection. Subsequently, March 23, 1885, the Bechuanaland Protectorate was extended northwards to 22° S. latitude, and westward to 20° E. longitude. (*See* SOUTH AFRICA, TRANSVAAL, etc.) Before the convention was signed measures had been taken—without British opposition—at Berlin to establish German authority on the west coast between the Orange river and the Portuguese province of Angola; and on Sept. 8, 1884, the German Government intimated to the British Government "that the west coast of Africa from 26° S. latitude to Cape Frio, excepting Walfish Bay, had been placed under the protection of the German emperor." In the same year, through the activities of Gustav Nachtigal, Togo and the Cameroon district were placed under German protection Before either of these events had occurred Great Britain had become alive to the fact that she could no longer dally with the subject, if she desired to consolidate her possessions in West Africa. The British Government had again and again refused to accord native chiefs the protection they demanded. The Cameroon chiefs had several times asked for British protection, and always in vain. But at last it became apparent, even to the official mind, that rapid changes were being effected in Africa, and on May 16, 1884, Edward Hyde Hewett, British consul, received instructions to return to the west coast and to make arrangements for extending British protection over certain regions. He arrived too late to save either Togoland or Cameroon, in the latter case arriving five days after King Bell and the other chiefs on the river had signed treaties with Nachtigal. But the British consul was in time to secure the delta of the River Niger and the Oil rivers district, extending from Rio del Rey to the Lagos frontier, where for a long period British traders had held almost a monopoly of the trade.

Meanwhile the French Government was strenuously endeavouring to extend France's influence in West Africa, in the countries lying behind the coast-line. During the year 1884 no fewer than 42 treaties were concluded with native chiefs, an even larger number having been concluded in the previous twelve-month. In this fashion France was pushing on towards Timbuktu, in steady pursuance of the policy which resulted in surrounding all the old British possessions in West Africa with a continuous band of French territory. On the lower Niger, however, in 1877, Mr. Goldie Taubman (afterwards Sir George Taubman Goldie) conceived the idea of establishing a settled government. Through his efforts the various trading firms formed themselves in 1879 into the "United African Company," and the foundations were laid of something like settled administration. An application was made to the British Government for a charter in 1881, and the capital of the company increased to a million sterling. Henceforth the company was known as the "National African Company," and it was acknowledged that its object was not only to develop the trade of the lower Niger, but to extend its operations to the middle reaches of the river, and to open up direct relations with the great Fula empire of Sokoto and the smaller states associated with Sokoto under a somewhat loosely defined suzerainty.

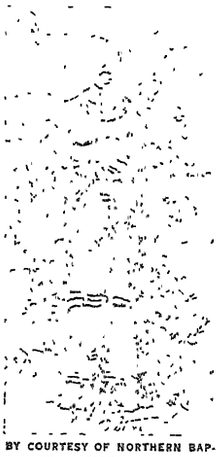
In North and East Africa also events had moved since 1875. In 1881 France, with the consent of the Powers, undertook to reorganize the finances and administration of the meagre remains of the once splendid and powerful kingdom of Tunis. Two years later, with Lord Granville's circular despatch of Jan. 3, 1883, England's long and onerous tutelage of Egypt began. (*See* EGYPT.) In East Africa, north of the Portuguese possessions, where the sultan of Zanzibar was the most considerable native potentate, Germany was secretly preparing the foundations of German East Africa Italy, too, had obtained a footing on the African continent. The Rubattino Steamship Company as far back as 1870 had bought the port of Assab as a coaling station, but it was not until 1882 that it was declared an Italian colony. This was followed by the conclusion of a treaty with the sultan of Assab, chief of the Danakil, signed on March 15, 1883, and subsequently approved by the king of Shoa, whereby Italy obtained the cession of part of Ablis (Aussa) on the Red sea, Italy undertaking to protect with her fleet the Danakil littoral One other event must be recorded The king of the Belgians had been driven to the conclusion that, if his African enterprise was to obtain any measure of permanent success, its international status must be recognized; and negotiations for the purpose were opened with various governments

**The Berlin Conference 1884–85.**—With these events there had grown up a general conviction that it would be desirable for the Powers interested in Africa to come to some agreement as to "the rules of the game," and to define their respective interests as far as practicable. A treaty between Britain and Portugal, giving undue recognition to Portuguese territorial claims, which was signed by Lord Granville on Feb. 26, 1884, but not ratified in view of the protests it had evoked, brought this sentiment to a head; and it was agreed to hold an international conference on African affairs. The conference assembled at Berlin on Nov. 15, 1884, and after protracted deliberations the "General Act of the Berlin Conference" was signed by the representatives of all the Powers attending the conference, on Feb. 26, 1885. The Powers represented were Germany, Austria-Hungary, Belgium, Denmark, Spain, the United States, France, Great Britain, Italy, Holland, Portugal, Russia, Sweden and Norway, and Turkey. Ratifications were deposited by all the signatory Powers with the exception of the United States. The General Act dealt with six specific subjects: (1) Freedom of trade in the basin of the Congo, (2) the slave trade, (3) neutrality of territories in the basin of the Congo, (4) navigation of the Congo, (5) navigation of the Niger, and (6) rules for future occupation on the coasts of the African continent. For the present purpose, however, the results effected by the Berlin Act may be summed up as follows. The signatory Powers undertook that any fresh act of taking possession on any portion of the African coast must be notified by the Power taking possession, or assuming a protectorate to the other signatory Powers. It was further provided that any such occupation to be valid must be effective. It is also noteworthy that the first reference in an international act to the obligations attaching to "spheres of influence" is contained in the Berlin Act.

Before the General Act was signed the International Association of the Congo was recognized by all the signatory Powers, with the not very important exception of Turkey. Two months later, in April 1885, King Leopold, with the sanction of the Belgian legislature, formally assumed the headship of the new state; and on Aug. 1 in the same year his Majesty notified the powers that from that date the "Independent State of the Congo" declared that "it shall be perpetually neutral" in conformity with the provisions of the Berlin Act. Thus was finally constituted the Congo Free State, under the sovereignty of King Leopold, though the boundaries claimed for it at that time were considerably modified by subsequent agreements.

**Partition Treaties.**—In the 15 years that remained of the 19th century the work of partition was practically completed. The international agreements which determined in the main the limits of the possessions of the various powers are:—

I. The agreement of July 1, 1890, between Great Britain and Germany defining their spheres of influence in East, West, and South-west Africa. This agreement was the most comprehensive of all the "deals" in African territory, and included in return for the recognition of a British protectorate over Zanzibar the cession of Heligoland to Germany.



II. The Anglo-French declaration of Aug. 5, 1890, which recognized a French protectorate over Madagascar, French influence in the Sahara, and British influence between the Niger and Lake Chad.

III. The Anglo-Portuguese treaty of June 11, 1891, whereby the Portuguese possessions of the west and east coasts were separated by a broad belt of British territory, extending north to Lake Tanganyika.

IV. The Franco-German convention of March 15, 1894, by which the Central Sudan was left to France (this region by an Anglo-German agreement of Nov 15, 1893, having been recognized as in the German sphere). By this convention France was able to effect a territorial junction of her possessions in North and West Africa with those in the Congo region.

V. Protocols of March 24 and April 15, 1891, for the demarcation of the Anglo-Italian spheres in East Africa.

VI The Anglo-French convention of June 14, 1898, for the delimitation of the possessions of the two countries west of Lake Chad, with the supplementary declaration of March 21, 1899, whereby France recognized the upper Nile valley as in the British sphere of influence

When a chief dies, selected members of his retinue are killed, and buried with him; the village is then abandoned

**The Congo State.**—The Congo Free State, which occupied, geographically, a central position, may serve as the starting-point for the story of the partition after the Berlin Conference. By his will, dated Aug 2, 1889, King Leopold made Belgium formally heir to the sovereign rights of the Congo Free State. Proposals for Belgium to assume responsibility for its administration were made unsuccessfully in 1895 and 1901. Later, the agitation in Great Britain and America against the Congo system of government and the admissions of an official commission of enquiry concerning its maladministration strengthened the movement in favour of transfer, until in 1905 Leopold II. was forced to yield, and the annexation treaty was approved by the Belgian parliament Thus the Congo state, after an existence of 24 years as an independent power, became a Belgian colony. (*See* CONGO, FREE STATE and BELGIAN CONGO.)

**French and British Rivalry.**—After the capture of Khartum and the death of Gen. C. G. Gordon, the Sudan was abandoned to the dervishes. The Egyptian frontier was withdrawn to Wadi Halfa, and the vast provinces of Kordofan, Darfur, and the Bahr-el-Ghazal were given over to dervish tyranny and misrule. It was obvious that Egypt would sooner or later seek to recover her position in the Sudan, as the command of the upper Nile was recognized as essential to her continued prosperity. But the international position of the abandoned provinces was by no means clear. The British Government, by the Anglo-German agreement of July 1890, had secured the assent of Germany to the statement that the British sphere of influence in East Africa was bounded on the west by the Congo Free State and by "the western watershed of the basin of the upper Nile"; but this claim was not recognized either by France or by the Congo Free State. From her base on the Congo, France was busily engaged pushing forward along the northern tributaries of the great river. The desire of France to secure a footing in the upper Nile valley was partly due to her anxiety to extend a French zone across Africa, but it was also to a large extent attributable to the belief, widely entertained in France, that by establishing herself on the upper Nile France could regain the position in Egyptian affairs which she had sacrificed in 1882.

In June 1896 Capt. J. Marchand left France with secret instructions to lead an expedition into the Nile valley. On July 10, 1898, he reached Fashoda, having established a chain of posts *en route*, and here the French flag was at once raised, and a "treaty" made with the local chief. Meanwhile, in 1896, an Anglo-Egyptian army, under the direction of Sir Herbert (afterwards Lord) Kitchener, had advanced southwards for the reconquest of the Egyptian Sudan. On Sept. 2, 1898, Khartum was captured, and the khalifa's army dispersed. It was then that news reached the Anglo-Egyptian commander, from native sources, that there were white men flying a strange flag at Fashoda. The sirdar at once proceeded in a steamer up Nile, and courteously but firmly requested Capt Marchand to remove the French flag. On his refusal the Egyptian flag was raised close to the French flag, and the dispute was referred to Europe for adjustment between the British and French Governments. A critical situation ensued. Neither Government was inclined to give way, and for a time war seemed imminent. Happily Lord Salisbury was able to announce, on Nov 4, that France was willing to recognize the British claims, and the incident was finally closed on March 21, 1899, when an Anglo-French declaration was signed, by the terms of which France withdrew from the Nile valley and accepted a boundary line which satisfied her earlier ambition by uniting the whole of her territories in North, West, and Central Africa into a homogeneous whole, while effectually preventing the realization of her dream of a transcontinental empire from west to east.

**British and Portuguese Spheres Defined.**—In the southern half of the continent, between the years 1885 and 1891, the Portuguese possessions on the west and east coasts were delimited, and Matabeleland and Mashonaland were occupied by the British South Africa Company. (*See* RHODESIA.) The relations between the British and Portuguese territories were determined by the treaty of June 11, 1891. Apart from defining the British and Portuguese spheres both south and north of the Zambezi, it contained many other provisions relating to trade and navigation, providing, *inter alia*, a maximum transit duty of 3% on imports and exports crossing Portuguese territories on the east coast to the British sphere, freedom of navigation of the Zambezi and Shirè for the ships of all nations, and stipulations as to the making of railways, roads, and telegraphs. Portugal was given both banks of the Zambezi to a point ten miles west of Zumbo—the farthest settlement of the Portuguese on the river. The boundary between the Portuguese sphere of influence on the west coast and the British sphere of influence north of the Zambezi was only vaguely indicated; but it was to be drawn in such a manner as to leave the Barotse country within the British sphere. Before the conclusion of the treaty the British Government had made certain arrangements for the administration of the large area north of the Zambezi reserved to British influence. On Feb. 1 Sir Harry Johnston was appointed imperial commissioner in Nyasaland, and a fortnight later the British South Africa Company intimated a desire to extend its operations north of the Zambezi. Negotiations followed, and the field of operations of the Chartered Company was, on April 2, 1891, extended so as to cover (with the exception of Nyasaland) the whole of the British sphere of influence north of the Zambezi (afterwards Northern Rhodesia). On May 14 a formal protectorate was declared over Nyasaland, including the Shiré highlands and a belt of territory extending along the whole of the western shore of Lake Nyasa. The name was changed in 1893 to that of the British Central Africa Protectorate, for which designation was substituted in 1907 the more appropriate title of Nyasaland Protectorate.

**British and German Rivalry.**—In July 1890, the British and German Governments came to an agreement upon the limits of their respective spheres of influence in various parts of Africa, and the boundaries of German South-West Africa were fixed in the position they now hold as those of the territory mandated to the Union of South Africa. These Powers were also the two great rivals on the east coast. Germany, on Dec. 30, 1886, and Great Britain, on June 11, 1891, formally recognized the Rovuma river as the northern boundary of the Portuguese sphere of influence on that coast; but it was to the north of that river, over the vast area of east or east central Africa in which the sultan of Zanzibar claimed to exercise suzerainty, that the struggle between the two rival powers was most acute. By an exchange of notes in Oct.–Nov. 1886, to which the sultan adhered on Dec. 4, 1886, the British and German Governments determined what territories were to be assigned to the sultanate of Zanzibar and agreed to a delimitation of their respective spheres of influence in East Africa. On Sept. 3, 1888, the British East Africa Association

received a charter and became the Imperial British East Africa Company. Shortly afterward the German colony of East Africa was founded. (*See* KENYA COLONY AND PROTECTORATE.)

Meanwhile, in the country to the west and north of the British sphere of influence a contest for Uganda had arisen between Karl Peters and the British East Africa Company. The contest was decided in favour of the latter by the Anglo-German Agreement of July 1, 1890. The provisions relating to East Africa were these:—In return for the cession of Heligoland, Lord Salisbury obtained from Germany the recognition of a British protectorate over the dominions of the sultan of Zanzibar, including the islands of Zanzibar and Pemba, but excluding the strip leased to Germany, which was subsequently ceded absolutely to Germany. Germany further agreed to withdraw the protectorate declared over Witu and the adjoining coast up to Kismayu in favour of Great Britain, and to recognize as within the British sphere of influence the vast area bounded, on the south, by the frontier line laid down in the agreement of 1886, which was to be extended along the first parallel of south latitude across Victoria Nyanza to the frontiers of the Congo Free State, on the west by the Congo Free State and the western watershed of the Nile, and on the north by a line commencing on the coast at the north bank of the mouth of the River Juba, then ascending that bank of the river until it reached the territory at that time regarded as reserved to the influence of Italy[1] in Gallaland and Abyssinia, when it followed the frontier of the Italian sphere to the confines of Egypt. To the south-west of the German sphere in East Africa the boundary was formed by the eastern and northern shore of Lake Nyasa, and round the western shore to the mouth of the Songwe river, from which point it crossed the Nyasa-Tanganyika plateau to the southern end of the last-named lake, leaving the Stevenson road on the British side of the boundary. The effect of this treaty was to remove all serious causes of dispute about territory between Germany and Great Britain in East Africa. It rendered quite valueless Peter's treaty with Mwanga and his promenade along the Tana; it freed Great Britain from any fear of German competition to the northwards, and recognized that her influence extended to the western limits of the Nile valley. But, on the other hand, Great Britain had to relinquish the ambition of connecting her sphere of influence in the Nile valley with her possessions in Central and South Africa. On this point Germany was quite obdurate; and an attempt subsequently made (May 1894) to secure this object by the lease of a strip of territory from the Congo Free State was frustrated by German opposition. A SWAHILI ELEPHANT TRACKER DRESSED IN SKINS. THESE MEN ARE EXPERTS IN DISTINGUISHING ALL VARIETIES OF SPOORS

On March 31 the union jack was raised, and on May 29 a fresh treaty was concluded with King Mwanga placing his country under British protection. A formal protectorate was declared over Uganda proper on June 19, 1894, which was subsequently extended so as to include the countries westwards towards the Congo Free State, eastwards to the British East Africa protectorate and Abyssinia, and northwards to the Anglo-Egyptian Sudan. The British East Africa protectorate was constituted in June 1895, when the Imperial British East Africa Company relinquished all its rights in exchange for a money payment, and the administration was assumed by the imperial authorities On April 1, 1902, the eastern province of the Uganda protectorate was transferred to the British East Africa protectorate, which thus secured control of the whole length of the so-called Uganda railway, and at the same time obtained access to the Victoria Nyanza.

[1]At this period negotiations between Great Britain and Italy had begun but were not concluded.

**Italy.**—Early in the 'eighties as already seen, Italy had obtained her first formal footing on the African coast at the Bay of Assab (Aussa) on the Red Sea. In 1885 the troubles in which Egypt found herself involved compelled the khedive and his advisers to loosen their hold on the Red Sea littoral, and, with the tacit approval of Great Britain, Italy took possession of Massawa and other ports on that coast In May 1889 the Italians concluded with the negus Menelek the Treaty of Uccialli which, besides settling the frontiers between Abyssinia and the Italian sphere, contained the following article:—

XVII. His Majesty the King of Kings of Ethiopia consents to avail himself of the Italian Government for any negotiations which he may enter into with the other Powers or Governments.

In Italy and by other European governments this article was generally regarded as establishing an Italian protectorate over Abyssinia; but this interpretation was never accepted by the emperor Menelek, and [illegible] Italy succeed in establishing any very effective control over Abyssinian affairs. By May 1894 under various agreements, the Italian and British Governments had fixed the northern limit of the Italian sphere as running from Ras Kasar on the Red Sea to the intersection of the Blue Nile with 35° E. longitude, and settled the boundary between their respective spheres on the Somali coast. But while Great Britain was thus lending her sanction to Italy's ambitious schemes the Abyssinian emperor was becoming more and more incensed at Italy's pretensions to exercise a protectorate over Ethiopia. In 1893 Menelek denounced the Treaty of Uccialli, and eventually, in a great battle, fought at Adowa on March 1, 1896, the Italians were disastrously defeated. By the subsequent Treaty of Addis Ababa, concluded on Oct. 26, 1896, the whole of the country to the south of the Mareb, Belesa, and Muna rivers was restored to Abyssinia, and Italy acknowledged the absolute independence of Abyssinia. By later negotiations with his European neighbours, the emperor Menelek secured boundaries on the south and west more favourable to Abyssinia than those assigned under the Anglo-Italian agreement. And Italian Somaliland, bordering on the south-eastern frontier of Abyssinia, became limited to a belt of territory with a depth inland from the Indian ocean of from 180 to 250 miles.

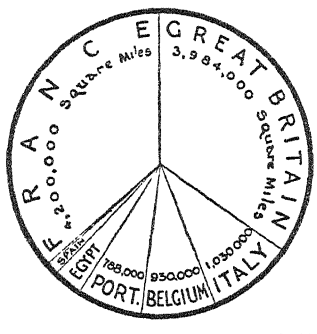
**Anglo-French Rivalry in West Africa.**—In West Africa the real struggle was between France and Great Britain, and France played the dominant part, the exhaustion of Portugal, the apathy of the British Government and the late appearance of Germany in the field all being elements that favoured the success of French policy. Two phases may be distinguished: the first dealing with the coast colonies, the second with the middle Niger and Lake Chad. On the coast France was wholly successful in her design of isolating all Great Britain's separate possessions in that region, and of securing for herself undisputed possession of the upper Niger and of the countries lying within the great bend of that river. At the date of the Berlin Conference the present colonies of Southern Nigeria and the Gold Coast constituted a single colony under the title of the Gold Coast colony, but on Jan. 13, 1886, the territory comprised under that title was erected into two separate colonies—Lagos and the Gold Coast (the name of the former being changed in Feb. 1906 to the colony of Southern Nigeria). In Aug. 1896, following the destruction of the Ashanti power and the deportation of King Prempeh, as a result of the second Ashanti campaign, a British protectorate was declared over the whole of the Ashanti territories and a resident was installed at Kumasi. But no northern limit had been fixed beyond the 9th parallel, and the countries to the north—Gurunsi (Grusi), Mossi and Gurma—were entered from all sides by rival British, French, and German expeditions. A few days before the meeting of the Berlin Conference Sir George Goldie had succeeded in buying up all the French interests on the lower Niger. The British company's influence had at that date been extended by treaties with the native chiefs up the main Niger stream to its junction with the Benue, and some distance along this latter river. But the great Fula states of the central Sudan were still outside European influence; and the German Government made efforts to secure a footing on the lower Niger until the fall of Prince Bis-

marck in March 1890 On the failure of the half-hearted attempt made later to establish relations with Gando from Togoland, Germany dropped out of the competition for the western Sudan and left the field to France and Great Britain. After its first great success the National African Company obtained a charter from the British Government, and on July 10, 1886, it became "The Royal Niger Company."

Notwithstanding her strenuous efforts, France, in her advance down the Niger from Senegal, did not succeed in reaching Sego on the upper Niger, a considerable distance above Timbuktu, until the winter of 1890–91, and the rapid advance of British influence up the river raised serious fears lest the Royal Niger Company should reach Timbuktu before France could forestall her. In 1892, however, after a troublesome war, France annexed some portion of Dahomey on the coast and declared a protectorate over the rest of the kingdom. Thus was removed the barrier which had up to that time prevented France pushing her way Nigerwards from her possessions on the Slave Coast, as well as from the upper Niger and the Ivory Coast. Henceforth her progress from all these directions was rapid, and in particular Timbuktu was occupied in the last days of 1893 It then appears to have been suddenly realized in France that, for the development of the vast regions which she was placing under her protection in West Africa, it was extremely desirable that she should obtain free access to the navigable portions of the Niger, if not on the left bank, from which she was excluded by the agreement of Aug 5, 1890, then on the right bank, where the frontier had still to be fixed by international agreement On Feb. 13, 1895, a French officer, Commander Toutée, arrived on the right bank of the Niger opposite Bajibo and built a fort. His presence there was notified to the Royal Niger Company, who protested to the British Government against this invasion of their territory; and eventually Toutée was ordered to withdraw, and the fort was occupied by the Royal Niger Company's troops In 1897 the attempt was renewed in the most determined manner. In February of that year a French force suddenly occupied Bussa, and this act was quickly followed by the occupation of Gomba and Illo higher up the river. In Nov. 1897 Nikki was occupied. The situation on the Niger had so obviously been outgrowing the capacity of a chartered company that for some time before these occurrences the assumption of responsibility for the whole of the Niger region by the imperial authorities had been practically decided on; and early in 1898 Capt. F. D. (afterwards Lord) Lugard was sent out to the Niger with a number of imperial officers to raise a local force in preparation for the contemplated change The advance of the French forces from the south and west was the signal for an advance of British troops from the Niger, from Lagos, and from the Gold Coast protectorate. The situation thus created was extremely serious The British and French flags were flying in close proximity, in some cases in the same village. Meanwhile the diplomatists were busy in London and in Paris, and in the latter capital a commission sat for many months to adjust the conflicting claims. Fortunately, by the tact and forbearance of the officers on both sides, no local incident occurred to precipitate a collision, and on June 14, 1898, a convention was signed by Sir Edmund Monson and M. G. Hanotaux which practically completed the partition of this part of the continent. (*See* NIGERIA.)

Thus in its broad outlines the partition of Africa was begun and ended in the short space of a quarter of a century. The result was to divide the continent among the Powers as follows —

| | Square miles. |
|---|---|
| British Africa | 2,101,411 |
| Egyptian Africa | 1,600,000 |
| French Africa | 3,866,950 |
| German Africa | 910,150 |
| Italian Africa | 200,000 |
| Portuguese Africa | 787,500 |
| Spanish Africa | 79,800 |
| Belgian Africa | 900,000 |
| Turkish Africa | 400,000 |
| Independent Africa | 613,000 |
| | 11,458,811 |



**Anglo-French Declaration, 1904.**—There were still many finishing touches to be put to the structure, but a large contribution to the process was made by the Anglo-French declaration of April 8, 1904, when a series of agreements relating to several parts of the globe were signed in London by Lord Lansdowne, the foreign secretary, and M Paul Cambon, the French ambassador, on behalf of their respective Governments. With regard to Egypt the French Government declared "that they [would] not obstruct the action of Great Britain in that country by asking that a limit of time be fixed for the British occupation or in any other manner." To understand the equivalent engagement taken by Britain, it must be recalled that to consolidate her position in north-west Africa France desired to make her influence supreme in Morocco. In April, 1902, it had been agreed between the French and Shereefian Governments to co-operate in establishing order in the frontier districts of Morocco and Algeria. Meanwhile in the northern districts of Morocco the unrest under the rule of the young sultan, Abd-el-Aziz IV., was attracting attention in Europe and evoking demands for its suppression. It was in these circumstances that in the declaration of April 1904 the British Government recognized "that it [appertained] to France, more particularly as a Power whose [illegible] conterminous for a great distance with those of Morocco, to preserve order in that country, and to provide assistance for the purpose of all administrative, economic, financial, and military reforms which it may require." Both parties, however, "inspired by their feeling of sincere friendship for Spain, [took] into special consideration the interests which that country [derived] from her geographical position and from her territorial possessions on the Moorish coast of the Mediterranean"; and in these interests the French Government undertook "to come to an understanding with the Spanish Government." The understanding was reached later in the same year, and thus Spain secured a sphere of interest on the Moroccan coast immediately facing the Spanish peninsula. Here it may be added that the protectorate of Spain over certain territories on the west coast of Africa, south of Morocco, had been notified to the Berlin Conference, and that by an agreement made with France in 1900 some 70,000sq.m. of the western Sahara were recognized as Spanish; while at the same time France admitted the claim of Spain to the ownership of the district around the Muni river to the south of Cameroons. The action taken by France in Morocco in accordance with the policy marked out in the Anglo-French declaration aroused the resentment of Germany, but on July 8, 1905, the republic secured from the German Government formal "recognition of the situation created for France in Morocco by the contiguity of a vast extent of territory of Algeria and the Shereefian empire, and by the special relations resulting therefrom between the two adjacent countries, as well as by the special interest for France, due to this fact, that order should reign in the Shereefian empire." Finally, in Jan.–April, 1906, a conference of the Powers was held at Algeciras to devise, by invitation of the sultan, a scheme of reforms to be introduced into Morocco (*q.v.*). French capital was allotted a larger share than that of any other Power in the Moorish state bank which it was decided to institute, and French and Spanish officers were entrusted with the organization of a police force for the maintenance of order in the principal coast towns. The new *régime* had not been inaugurated fully, however, when a series of outrages led, in 1907, to the military occupation by France of Oudjda, a town near the Algerian frontier, and of the port of Casablanca on the Atlantic coast of Morocco.

### LATER POLITICAL DEVELOPMENTS

The political map of Africa changed very considerably between 1910 and 1925. In 1910 the British self-governing colonies of the Cape, Natal, Transvaal, and Orange River were formed into the Union of South Africa, with a single government and one legislature. In 1911 a considerable area of French Equatorial Africa was transferred to German Cameroons and in return Germany acknowledged a French protectorate over the greater part of Morocco. On March 30, 1912, a protectorate treaty between France and the sultan was signed at Fez; and by a Franco-Span-

ish convention of Nov. 27 the Spanish zones in Morocco were defined. In 1912, also, Italy annexed the Turkish vilayets of Tripoli and Bengasi (Cyrenaica), to which the common name of Libya was given. In Dec. 1914 a British protectorate over Egypt was proclaimed, but by a declaration of Feb. 1922 Great Britain acknowledged the independence of Egypt. The status of the Anglo-Egyptian Sudan remained unchanged.

In June 1919, by the Treaty of Versailles, Germany renounced possession of all her oversea protectorates in favour of the principal Allied and Associated Powers. These territories, which had all been conquered by the Allies during the World War, were placed under mandatories. The Union of South Africa became mandatory for German South-West Africa; Togoland was divided between France and Great Britain; and France became mandatory for Cameroons, except for a small portion which was placed under the administration of British Nigeria. Britain became mandatory for German East Africa, renamed the Tanganyika Territory, but by subsequent Anglo-Belgian agreements Belgium became mandatory for the provinces of Ruanda and Urundi. In 1920–25 Italy gained additions to Tripoli and Cyrenaica by arrangements with France and Egypt and to Italian Somaliland by arrangement with Great Britain. In 1936, Italy annexed Abyssinia.

HOW AFRICA'S 11 MILLION SQUARE MILES ARE DIVIDED AMONG THE NATIONS. THE FIGURES FOR THE THREE SEGMENTS TOO SMALL TO SHOW ARE: EGYPT, 350,000 SQ.M.; SPAIN, 140,000 SQ.M., AND IN THE SMALLEST SEGMENT, LIBERIA, 40,000 SQ.M.

As a result of these changes Africa was divided among the following Powers. The territories governed under mandate are reckoned in the possession of the Power named:—

| | | | |
|---|---|---|---|
| France . . . | 4,200,000 | Italy . . . . | 1,030,000 |
| Great Britain . . | 3,984,000* | Egypt . . . | 350,000 |
| Belgium . . . | 930,000 | Spain . . . | 140,000† |
| Portugal . . . | 788,000 | Liberia . . . | 40,000 |

*Including Anglo-Egyptian Sudan.
†Including the Spanish zones in Morocco.

These figures give a total of 11,462,000sq m as the area of Africa. In the absence of definite surveys of large areas of the continent this may be regarded as a close approximation to accuracy.

**German Policy.**—The extinction of Turkish rule in North Africa had long been foreseen and was no matter for regret. It ended a connection which had lasted five centuries and had been almost wholly evil in its effects. German sovereignty in Africa had only dated from 1884 and had been rapidly enlarged. Endeavours to extend it further had been a prominent factor in German policy for a decade before the World War. Germany desired a footing on the African coast of the Mediterranean and a port on the Atlantic coast of Morocco. These desires conflicted with Italian and French ambitions, and in 1911 the issue on both points was decided against Germany. As to Morocco, a Franco-German convention of Feb. 9, 1909, had recognized the privileged position of France in Morocco, but not a French protectorate over that country, and the sending of the German gunboat, "Panther," to Agadir, in July, 1911, was a protest against what Germany considered an unwarranted extension of French influence in Morocco, and an intimation that if German treaty rights in Morocco were to be renounced, France must make compensation. The intervention of Great Britain on the side of France put an end to a dangerous situation; Germany, by a convention concluded Nov. 4, 1911, accepted compensation in Central Africa and withdrew opposition to the establishment of a French protectorate in Morocco.

While the Franco-German negotiations were in progress Italy abruptly declared war on Turkey and invaded, and held, Cyrenaica and Tripoli. Thus Germany, who had designed to exploit those vilayets through the medium of an Austro-Hungarian chartered company, was deprived of her last opportunity—short of war—of gaining a [illegible] n the Mediterranean. She turned her attention to the development of a *Mittel Afrika* policy. This policy aimed at securing Germany's supremacy, primarily economic and ultimately political, in central equatorial Africa. The aim was to reserve the Belgian Congo, Angola and Mozambique, north of the Zambezi, as a German sphere, and thus to link up Cameroons with the South-West and East Africa protectorates German industries had need of the raw material tropical Africa produces, and, moreover, southern Angola was a good field for European settlement.

British statesmen were not unfavourable to German expansion in equatorial Africa, so long as it was confined to the economic sphere. In 1898 an agreement, signed by Mr A. J. (afterwards Lord) Balfour and Count Hatzfeldt, had divided Angola and Mozambique into spheres in which Great Britain and Germany respectively were to give financial and economic help to the Portuguese. This was followed in 1899 by the Treaty of Windsor, the object being to reassure Portugal that the Balfour-Hatzfeldt agreement was not in derogation of her sovereign rights in Africa. Neither the agreement with Germany nor the treaty with Portugal was published.

After the settlement of the Morocco crisis, Germany reopened negotiations with Great Britain in respect of Portugal's African colonies, and Prince Lichnowsky (the German ambassador) and Sir Edward (afterwards Lord) Grey reached a new agreement, which was ready for signature in 1913. Nearly all Angola was recognized as a German economic sphere, as well as the northern part of Mozambique. The rest of Mozambique, including Delagoa Bay and the Zambezi valley, was to be a British economic sphere. Sir Edward Grey made it a condition of signing that the 1898 and 1899 documents should be published. The German foreign office raised objections, Herr von Jagow (then foreign minister) stating that the German Press would regard the terms of the Treaty of Windsor and the Lichnowsky agreement as contradictory. In July 1914, however, German consent to publication had been given, but before the new agreement could be signed the World War had broken out.

**The World War.**—During the progress of the campaigns in Africa the whole of the continent, except Abyssinia and the Spanish protectorates, became involved in the struggle. The conquest of the German colonies was foreseen in the negotiation which preceded Italy's entry into the war, and Article 13 of the agreement signed in London on April 26, 1915, between France, Russia, Great Britain, and Italy, laid down that:—

In the event of France and Britain increasing their colonial territories in Africa at the expense of Germany, those two Powers agree in principle that Italy may claim some equitable compensation, particularly as regards the settlement in her favour of the questions relative to the frontiers of the Italian colonies of Eritrea, Somaliland and Libya, and the neighbouring colonies belonging to France and Great Britain.

**Italian Ambitions.**—Italian ambitions had gone beyond the readjustment of frontiers; in particular Italy wished to acquire Jibuti, the port of French Somaliland and the starting place of a railway to Abyssinia. As Jibuti was the only French port on the Suez canal route to the East and to Madagascar, as well as the only approach to Abyssinia that France possessed, she declined to entertain proposals for its surrender.

Italy, however, obtained from France a welcome rectification of the Tripoli-Tunisia frontier, as well as valuable concessions in Tunisia.

In regard to the Cyrenaica-Egyptian frontier, the British Government, in 1919, offered Italy a readjustment of territory in the Libyan desert. The negotiations had not been concluded when Egypt was granted independence and after that time they were conducted directly between Italy and Egypt. They turned largely on the possession of the oasis of Jaghbub, a place of some strategic importance, where is also the tomb-mosque of the founder of the Senussi sect. On Dec. 6, 1925, an Italo-Egyptian agreement was signed, by which Jaghbub was included in Cyrenaica. The wells to the west of El Sollum were included in

Egyptian territory, thus giving El Sollum a needed water supply. South of Siwa the frontier was drawn along longitude 25° E. to the boundary of the Anglo-Egyptian Sudan in latitude 22° North.

Meanwhile Mussolini pressed again for a sphere of influence in Ethiopia. Notes were exchanged with England in 1925 undertaking to support the latter's request for the right to build a dam at Lake Tana in return for support for Italy's demand for a sphere in western Ethiopia. When England, seeing an opportunity to get the dam built by Egyptian and American interests, crossed the Italian cause, Mussolini turned first to France and then in 1935 to direct aggression upon Abyssinia (*q.v.*). The war of conquest by Italy stirred the entire world. It was a direct assertion of white supremacy over a native and independent sovereignty which, in Sept. 1923, had been admitted to the League of Nations. In May 1936 Abyssinia was subdued and annexed. With Eritrea and Italian Somaliland, this ancient kingdom is included in an East African dependency over which the King of Italy has been declared Emperor.

**France and Spain.**—In the same year (1912) that France obtained her protectorate in Morocco she concluded an arrangement with Spain whereby a Spanish protectorate was set up in the northern part of the sultanate, the port of Tangier and a small area around it being made, however, an international zone. In the French protectorate Marshal Lyautey, the resident-general, adopted a bold and conciliatory policy and won the confidence and respect of the Moors. He was succeeded in 1925 by M. Theodore Steeg, the governor-general of Algeria. In their zone the Spaniards met with determined opposition, largely owing to the uprise of a Moor, styled Abdel-Krim. In the territory known somewhat vaguely, as Er-Rif, there seems to have been, as in the coastward portions of Algeria and Tunisia, a much more marked Iberian element in the population than there is in the south of Morocco, and this part of northern Morocco had shown a great hatred of European interference. The Spaniards suffered a severe reverse in 1921 and there was again heavy fighting in 1924 and 1925. In the last-named year the Rifs invaded the French zone, but were defeated and driven back. In the next year the insurrection was successfully quelled; and in 1927 the king and queen of Spain were cordially received. In Southern Rhodesia the growth of a vigorous white community led to that country being made, in 1923, a self-governing colony of the British Empire, and with the assumption of direct imperial control of Northern Rhodesia in 1924 chartered-company rule in British Africa came to an end. In East Africa another vigorous and vocal white community made its influence felt, namely the settlers in the British East Africa Protectorate, which protectorate was annexed to the British Crown in 1920 and renamed Kenya Colony.

A subject which raised large issues was the position of Indians in South and East Africa, but it was of less importance than the growth of race consciousness among the Bantu and the negroes. Increase of education and of Christianity, the employment of large numbers of Africans in industries, and the lessons taught by the World War were among the factors which intensified the feeling of racial unity and led to manifestations of a new anti-white movement. This movement was different from the simple objection to interference by Europeans, or Arabs, previously displayed, and had a consciousness of the need of self-development.

**France in North Africa.**—Apart from the awakening of the African peoples to race-consciousness, two recent developments in the European occupation of the continent are noticeable. France has shown definite progress in the task of restoring north-west Africa to the place in Mediterranean civilization which it held from the 6th century B.C. to the 7th century of the Christian era, when the Mohammedan conquest began. Under British administration the peoples of East Africa have emerged rapidly since the World War to industrial and political advancement. Since 1912, when she acquired the protectorate of Morocco, the authority of France has become increasingly effective in the fertile littoral and high plateaux of the western half of North Africa. The political and economic development of this Mediterranean area upon European lines has been assured by the expansion of Algeria southward and the subsequent linking up of Saharan Algeria with the western Sudan, the French west coast colonies, and French Congo in a vast and coherent African empire. Barely a century ago the French expeditionary force landed at Sidi Ferruch on June 14, 1830. The declared purpose of the French cabinet was "to abolish slavery and piracy, to re-establish the security of navigation in the Mediterranean and open up its southern coasts anew to agriculture, civilization, commerce, and the free access of all nations." In the interval the "restricted occupation" of the coast towns has become the "total occupation" of Algeria, and the conquest of "the South"; while the incorporation of Northern Algeria into France has been followed by the protectorates of Tunis (1881) and Morocco (1912). Within these hundred years the European element in North Africa has risen from a handful of consular officials and merchants to well over a million residents, or approximately to one-tenth of the total population. Great European towns have been built. Agriculture and stock-raising have become infinitely more productive, minerals have been found and worked and new industries introduced. Order and public security have been established in regions to which Rome never sought to penetrate and over peoples that the legionaries strove in vain to subdue. The increasing throng of tourists who yearly traverse North Africa by rail and car from Algiers to the Saharan oases and from Carthage to Marrakesh, and the frequency and regularity of the steamship services which maintain intercourse between the European and African shores of the Mediterranean, are evidence of the success with which France has fulfilled her primary task of re-opening to Europe this lost province of the Graeco-Roman world.

**British Development.**—After the World War appreciable progress was made in the construction of development works and in production in Uganda, Kenya, and Tanganyika (formerly German East Africa); and with a view of [illegible] the economic capacity of these and the neighbouring territories of Zanzibar, Nyasaland, and Northern Rhodesia, the possibility of administrative co-operation between the several governments concerned came under consideration. As the result of conferences on this subject held in 1927 the colonial office appointed the Hilton Young Commission to inquire into the question of the federation, or other union, of the British territories from Northern Rhodesia to Uganda. And, by the desire of its ministry, Southern Rhodesia (which became self-governing in 1923) was included in the scope of the commission. The project of an administrative union, of which this official enquiry into the views of the several governments and populations concerned was the first step, acquires a special interest from the character and geographical position of the colonies affected. Both the East, and the South African colonies are mixed African and European states, in which, although the mass of the inhabitants are African, the European minority is politically dominant. But while, broadly speaking, in the former the numerical predominance and economic importance of the African population are such that the interests of this population have priority in the eyes of the administration over those of the European, in the latter, with the exception of the native territories of the high commission, the European population and its economic importance are so relatively great that European interests stand first. In the East Coast colonies, however, African interests are not so predominant as they are in the (British) West Coast colonies; and in this respect these East Coast colonies hold a position midway between the frankly African West Coast colonies and the frankly European Union of South Africa and Southern Rhodesia. The federation, if effected, of a group of colonies of this intermediate type, by showing whether a central administration is a more effective medium for arriving at a due balance between African and European interests, may be expected to provide data germane to the whole subject of the European tutelage of African peoples. And in particular, as the result of the inclusion of Southern Rhodesia in the purview of the commission and the consequent possibility of Northern Rhodesia or its western portion being incorporated into Southern Rhodesia, it is probable that the question whether Northern Rhodesia, with its large area of 300,000sq.m., is to be

administered as a "plantation" colony or to become a new centre of British population will be at length determined.

**Tangier.**—The status of the Tangier International Zone was regulated by the Act of Algeciras (April 7, 1906), until modified by the conference which formulated the Tangier Statute in 1923. Although certain Powers signatory of the Algeciras Act, notably Italy, withheld their adhesion, this protocol came into force on June 1, 1925. But Spain continued to maintain that the only satisfactory arrangement was the incorporation of Tangier in the Spanish Zone by which it was encircled: while France insisted that her position in Morocco required that Tangier and its communications should be under her control. The visit of a division of the Italian navy to Tangier in Oct. 1927, emphasized Italy's refusal to recognize the statute. On March 3, 1928, agreement was reached between France and Spain. At a second conference (March 20) of France, Spain, Italy and Great Britain the Franco-Spanish Agreement of March 3, was adopted, the statute was modified, and the claims of Italy to participate in the government of Tangier were satisfied (July 17).

## RECENT EXPLORATION

**Progress Since 1910.**—The largest unknown area of Africa in 1910 was in the Sahara desert; the greatest gaps on the map were in the Libyan desert. In 1920–21 Mrs. Rosita Forbes took an expedition across the Libyan Desert to Kufra, the headquarters of the Senussi Tariq. In 1922–23 Ahmed Bey Hassanein, who had accompanied her, led an expedition through Kufra and the southern oases to Darfur. Mrs. Forbes has made further journeys through Abyssinia, the western Mauretanian desert and western Arabia. Hassanein Bey in 1923 journeyed through the Libyan desert into Darfur and Kordofan. Previous explorations by the French (1912–17) had increased knowledge of the eastern limits of the Chad basin, and had definitely proved its distinction from the western basin of the Nile. Col. Tilho's expeditions had revealed altitudes in Tibesti of 11,200ft. and the height of Mt. Tuside as 10,700ft.; lesser altitudes of 9,800ft. were determined at Jebal Marra, in Darfur, and of 4,000 to 5,000ft. on the western borders of the Sudan. The Tibesti belt of highland probably played a great part in southward spreads of fauna and flora in Miocene and Pliocene times. In the Nilotic Sudan, east of the main Nile, altitudes of 10,000ft. were discovered in 1911–12 by Col. H. D. Pearson. In 1916 Maj. Cuthbert Christy made an interesting journey along the south-western limits of the Nile basin, traversing the ironstone region where adjoining head-streams flow either southwards into the Mbomu and its affluents (Congo basin) or north-east into the Nile basin.

A ZULU WARRIOR IN FULL BATTLE ARRAY

Carefully trained in military tactics, the Zulu warrior was feared by his neighbours as a formidable enemy

French officers, notably Capt. Augiéras, have conducted (from 1904) a scientific survey of the western Sahara, from southern Morocco to the Senegal river and the northern Niger. Augiéras has shown how the intense "desert" conditions of the western Sahara with few oases except on the periphery, accompany the extreme temperatures of the low-lying dunes, which quickly lose heat. The great Juf depression remained unexplored up to 1922; but since then the Citroën expedition from the latitudes of Insalah and Ahaggar in southern Algeria has increased our knowledge of this area. Portuguese Guinea, with its large rivers, has been partly explored, and since 1921 the vast southern part of the Niger basin, and the Black and White branches of the mighty Volta river, have become better known. Northern Togoland, Dahomey, southern Nigeria and the basin of the great Benue river have been mapped in detail.

**East and Central Africa.**—Much intensive work has been done in East and Central Africa. I. N. Dracopoli in 1912–1913 explored part of Jubaland; he reached the Lorian swamp, which receives the waters of the Uaso Nyiro, and showed its connection with the Juba river in Italian Somaliland. In April 1912 G. F. Archer (later Sir) completed surveys connecting the triangulation of British East Africa with the Abyssinian boundary survey. A survey by Capt. E. M. Jack, in 1911, of the region between Lakes Kivu and Victoria added to the knowledge of the Mufumbiro range of active volcanoes; Karisimbi was found to be 14,780ft. high. Since that time the Mufumbiro region and western Uganda have been surveyed in considerable detail. In 1927 geologists of the Swedish Institute found three series of sloping beaches along

the Rift valley between Menengai and Longonot, and also collected much data relative to the glaciation of Mt Elgon and Kilimanjaro, and to the glacial geology of East Africa in general.

The first survey along its whole length of the Congo-Zambezi watershed was made in 1911–14 by Anglo-Belgian and Anglo-Portuguese boundary commissions. Many rivers run for considerable distances parallel to the divide, which is largely bush-covered. Maj. Reginald Walker, one of the British commissioners, discovered that the Luapula, a main headstream of the Congo, did not issue from Lake Bangweulu, but was a continuation of the Chambezi, which passes through the great swamp south of Bangweulu

**Results of the War.**—During the World War, needs of campaigning led to many additions to the knowledge of the topography of inter-tropical Africa, partly through use of aircraft for survey purposes. Thus very useful maps were made of the northern part of Portuguese East Africa. In 1920 Dr. P. Chalmers Mitchell, who flew over the Nile basin proved the value of air reconnaissance to geology by the discovery in the Bayuda desert, north of Khartoum, of the volcanic character of a range of hills A little later the French began to use aeroplanes for survey purposes in the Sahara. (X.)

**AFRICA, ROMAN,** comprised the whole of the continent known to the ancients, except Egypt and Ethiopia. The official and administrative language used the word Africa in a narrow sense, as noticed below. The term was borrowed by the Romans from the language of the natives. In Latin literature it was employed for the first time by the poet Ennius, who used it of the territory of Carthage and the eastern group of the Atlas. Numerous conjectures have been made as to the etymology of the term Africa; the best is that of Charles Tissot, who sees in the word "Africa" the name of the great Berber tribe, the Aourigha (whose name would have been pronounced Afarika), the modern Aouraghen, in ancient times the principal indigenous element of the African empire of Carthage (Tissot, *Géogr. comp.* i. 389). Africa was, in the eyes of the Romans and Carthaginians alike, the country inhabited by the great tribe of Berbers or Numidians called Afarik.

At the time of the Third Punic War the Africa of the Carthaginians was but a fragment of their ancient native empire, the rest of Africa having passed into the hands of the kings of Numidia, who were allies of the Romans.

After the capture of Carthage by Scipio (146 B.C.) this territory became a Roman province, and a trench, the *fossa regia,* was dug to mark the boundary of the Roman province of Africa and the dominions of the Numidian princes. The remains of this ditch, protected by a low wall or a stone dyke, have been discovered (1907); some of the boundary stones which marked its course, and inscriptions mentioning it, have also been found. From Testur on the Mejerda the *fossa regia* can be followed by these indications for several miles along the Jebel esh-Sheid. The ditch ran northward to Tabarca and southward to Tina. The ditch which in later times divided the provinces of *Africa vetus* and *Africa nova* was at the time of the Third Punic War the boundary of Carthaginian territory. The government of the Roman province thus delimited was entrusted to a *praetor* or *propraetor.* The towns which had fought on the side of the Romans during the Third Punic War were declared *civitates liberae,* and became exceedingly prosperous, *e.g.,* Utica, Hadrumetum and Thapsus.

After the Jugurthine war in 106 B.C. the whole of the *regio Tripolitana* on the littoral of the two Syrtes, was annexed to the Roman province. The battle of Thapsus in 46 B.C. made the Romans definitely masters of Numidia which was converted into a new province called *"Africa Nova":* the old province of Africa was known as *"Africa Vetus."*

In 31 B.C. Octavius gave up Numidia, or Africa Nova, to King Juba II. Five years later Augustus gave Mauretania and some Gaetulian districts to Juba, and received in exchange Numidia, which thus reverted to direct Roman control, no longer forming a distinct government, but attached to the old province of Africa. From 25 B.C. the Roman province of Africa comprised the region between the mouth of the Ampsaga (Wad Rummel, Wad el Kebir) on the west, and the two tumuli called the altars of the Philaeni, the immutable boundary between Tripolitana and Cyrenaica, on the east (Tissot ii. 261). In the partition of the government of the provinces of the Roman empire between the senate and the emperor, Africa fell to the senate, and was henceforth administered by a proconsul.

The province of Africa was the only senatorial province whose governor was originally invested with military powers. The proconsul of Africa had command of the *legio III. Augusta* and the auxiliary corps. But in A D 37 Caligula deprived the proconsul of his military powers and gave them to the imperial legate (*legatus Augusti pro praetore provinciae Africae*), whose special duty it was to guard the frontier zone (Tacitus, *Hist.* iv 48; Dio Cass lix 20). The headquarters of the imperial legate were originally at Cirta and afterwards at Lambaesa (Lambessa). The military posts along the frontier of the desert formed an immense arc extending from Cyrenaica to Mauretania. A network of military routes, constructed and kept in repair by the soldiers, led from Lambaesa in all directions, and stretched along the frontier as far as Leptis Magna. The powers of the proconsul scarcely extended beyond the ancient *Africa Vetus* and the towns on the littoral. Septimius Severus detached from the province of Africa the greater part of Numidia to constitute a special province governed by a *procurator,* subordinate to the imperial legate and resident at Cirta (Tissot ii. 34). This province was called Numidia Cirtensis.

In Diocletian's reform, the whole of Roman Africa, with the exception of Mauretania Tingitana (which was attached to the province of Spain), constituted a single diocese subdivided into six provinces. Changes were necessitated by the wars with the Moors and the Vandals. By a treaty concluded in A.D. 476, the Emperor Zeno recognized Gaiseric as master of all Africa. Reconquered by Belisarius in 534, Africa formed, under the name of *praefectura Africae,* one of the great administrative districts of the Byzantine empire. In A.D. 647 the Arabs penetrated into *Ifrikia,* which was destined to fall for ever out of the grasp of the Romans. In A.D. 697 Carthage was taken.

The population of Roman Africa was composed of three chief elements: the indigenous Berber tribes, the ancient Carthaginians of Phoenician origin and the Roman colonists. The Berber tribes, whose racial unity is attested by their common spoken language and by the Berber inscriptions that have come down to us, bore in ancient times the generic names of Numidians, Gaetulians and Moors or Maurusiani. Besides the Afri (Aourigha) of the territory of Carthage, the principal tribes that took part in the wars against the Romans were the Lotophagi, the Garamantes, the Misulani or Musulamii, the Massyli and the Massaesyli. African epigraphy has revealed the names of some of their deities: *deus invictus Aulisva;* the god Motmanius, associated with Mercury; the god Lilleus; *Kautus pater;* the goddess Gilva, identified with Tellus (Tissot i. 486). There were also local divinities in all the principal districts. The rock bas-reliefs and other monuments showing native divinities are rare, and give only very summary representations.

During the Roman period the ancient Carthaginians of Phoenician origin and the bastard population termed by ancient authors Libyo-Phoenicians, formed the predominant populations of the towns on the littoral, and retained the Punic language until the 6th century of the Christian era. The municipal magistrates took the title of *suffetes* in place of that of *duumvirs,* and in certain towns the Christian bishops were obliged to know the *lingua Punica,* since it was the only language that the people understood. Nevertheless, the Roman functionaries, the army and the colonists from Italy soon brought the Latin element into Africa, where it flourished with such vigour that, in the 3rd century A.D., Carthage became the centre of a Romano-African civilization of extraordinary literary brilliancy, which numbered among its leaders such men as Apuleius, Tertullian, Arnobius, Cyprian and Augustine.

Carthage regained its rank of capital of Africa under Augustus, when thousands of Roman colonists flocked to the town. Utica

became a Roman colony under Hadrian, and the *civitates liberae, municipia, castella, pagi* and *turres* were peopled with Latins. The towns of the ancient province of Africa which received *coloniae* were very numerous.

The province of Numidia was at first colonized principally by the military settlements of the Romans Cirta (Constantine) and Bulla Regia (Hammam Darraj), its chief towns, received *coloniae* of soldiers and veterans, as well as Theveste (Tebessa) and Thamugas (Timgad). The fine ruins which have been discovered at the last-mentioned place have earned for it the surname of the African Pompeii.

**AFRICAN LANGUAGES.** Language and race have not necessarily common boundaries, but in classifying a group of languages the relation between the two must not be ignored. Apart from recent European immigration, Africa has four main types of people: Pygmy-Bushman, Negro, Hamitic and Semitic. These four races correspond to four types of languages, though the Negro group was later subdivided into two different units, viz., Sudanic and Bantu.

There is a certain unanimity regarding the main divisions, and the five groups: Bushman, Sudanic, Bantu, Hamitic, Semitic, may be considered as finally settled. Problems on which no agreement has been arrived at are: the position of Bushman (and Pygmy), the unity of the Sudanic languages, the relation between Sudanic and Bantu, and the comprehension of the term Hamitic languages

**Semitic Languages.**—These tongues are spoken in Abyssinia, probably as a result of colonization from southern Arabia. Ge'ez is extinct, Amharic (*q.v.*) is in part a modern representative of Ge'ez Out of Amharic two new languages have evolved: Tigre and Tigrinya. Other dialects are those of Gurague and Harar. Of greater importance is Arabic, which is the ruling language in north Africa and in parts of eastern Sudan; through Islamic influence it has become a literary idiom in east Africa and the Sudan.

**Bushman Languages.**—The Bushman tribes speak a number of languages, which, however, are all allied and may be divided into three groups, southern, central and northern. Phonetically they are remarkable for the occurrence of the so-called clicks (*q.v.*). Another feature, not only in Bushman languages, but also in Hottentot, Sudanic and Bantu, is intonation.

Each syllable, and sometimes also a single-voiced consonant, has its own level of tone, which is as essential a part of a word as the sounds. Words with identical sounds, but differing in tone, have no etymological relation whatever to each other.

A number of the features of the Bushman languages are found in Sudanic languages, *e.g.*, intonation, monosyllabism, non-distinction between verb and noun in form, position of the genitive, formation of plural by "they," but as no etymological relations have as yet been ascertained it seems premature to ally the Bushman languages with the Sudanic group.

No Pygmy language is known. The Pygmies use their neighbours' speech. There seems to be evidence that some groups use a different mode of speech—yet unrecorded—in internal life.

**Sudanic Languages.**—This group is found, roughly speaking, in the stretch of the continent situated between the Atlantic ocean (Senegambia-Cameroons) and the western slopes of Abyssinia. Some enclaves, as Nuba and Kunama in the north, Gaya and Nyifwa-Kavirondo in east Africa, lie beyond this region.

This large group, stretching through the whole breadth of the continent, does not form a unit in the same sense as do the Bantu languages. It is broken up into numerous subdivisions, each of which has evolved its own type, and in the case of some tongues the divergences are so great that up to the present time, their relationship with others has not been demonstrated. The Sudan has been invaded over its whole area from time immemorial by peoples and languages from north and east. Linguistic conditions to-day are the result of this constant movement and shifting, which modified or destroyed original units and created new ones. Languages, probably whole groups of languages, have perished, or scanty remains have been embodied in new formations. As the invading tongues were largely of types differing radically from the Sudanic, these changes were radical and deeply influenced the original character of the language. Thus languages like Kanuri, Wolof and others, have been so transformed that as yet their inclusion in the Sudanic group may seem to be merely theoretical.

**Common Substratum.**—While it is thus necessary to emphasize the highly complicated linguistic situation in the Sudan, and the present incomplete [illegible] of many problems involved, yet the Sudanic group as a whole shows certain common characteristics in phonology and structure, and there are also etymological relationships. There exists a common substratum of Sudanic speech, which is strongest where the original Negro element is strongest in population. This common substratum justifies the use of the term Sudanic languages. Some illustrations may be given: (1) the prevalence of intonation. (2) Monosyllabic stems (Ewe *ku* "death," Nuba *tu* "belly"). (3) Nouns are formed from verbs by a vocalic or nasal prefix (Yoruba *ra* "to buy," *o-ra* "buyer," Shilluk *bugo* "to press the bellows," *o-buk* "bellows"). (4) Plural of nouns is formed by adding to the noun a plural noun or pronoun (Ewe *ati* "tree," *ati-wo* "trees," Nuer *chak* "tick," *ke-chak* "ticks," *-wo* and *ke-* are the pronouns of the third person plural in Ewe and Nuer). (5) Plural of nouns is formed by adding *i* or *a* (Ibo *o-ru* "slave," *i-ru* "slaves"; Nuer *bel* "artist," *bel-i* "artists", Edo *o-ya,* pl. *a-ya* "man"; Zande *boro,* pl. *a-boro* "man"). (6) Distinction between inanimate things and animate beings (or persons), the latter in most cases having the affix *"o"* (Twi *o-nipa* "man"; in Shilluk *o* designates persons as descendants of other persons: *nayo* "the mother's brother," *o-nayo* "the mother's brother's child"). There is no grammatical sex-distinction. (7) In genitive relation the possessor precedes the possessed (Twi *nipa dua* "a man's figure," Kunama *Ila masa* "Ila's lance"). (8) There is no formal distinction of case. The dative form is circumscribed by the verb "to give" (Ewe *edi ga na fofo* "he sought money gave father": he sought money for the father. Nuba *ir iga tir onam* "you say give him": you say to him. (9) Postpositions, *i.e.,* space-denoting nouns, are used in the place of [illegible] (Ewe *ati ta* "tree's head": on the tree; Nuba *ka tu* "house's belly": in the house. (10) Verbal combinations are frequent (Ewe *tso va na* "take come give": to bring to; Nuba *atta-den* from *ed-ta-den* "take come give": to bring to). (11) The verbal stem is not changed in conjugation; tenses and modes are expressed by adding grammatical form words which in many cases can be traced to original nouns or verbs (in Twi the future is formed by prefixing *ba* [from *bia*] "to come," in Nuba by prefixing *bi* "to come"). (12) Sounds peculiar to the majority of Sudanic languages are the labio-velar *kp* and *gb*. (13) A considerable number of word-stems are identical. The characteristics just mentioned are not found in each sub-group, but there is no group which does not possess a number of them.

**Divisions.**—The Sudanic family may be geographically divided into an eastern, a central and a western group. The largest section of the eastern group are the Niloto-Sudanic languages comprising Shilluk with its many subdivisions, Dinka, Nuer and probably also Burun between the White and Blue Niles. Nuba on the Nile, in the Nuba mountains and in Kordofan, is connected with the Nilotic group, while other languages of these mountain regions are of a distinct character, having a class division of the noun.

The central group stretches between the 30th and 10th degree east long, and is subdivided by Delafosse into (*a*) Nile-Congo group, which, however, contains languages that are more closely related to the eastern Sudanic group; (*b*) Ubangi group; (*c*) Shari-Wadai group; (*d*) Shari group; (*e*) Niger-Tshad group; (*f*) Niger-Cameroons group. Our present knowledge concerning the central Sudanic group is so insufficient that the grouping just given is only provisional.

The western Sudanic group is better known and the sub-groups are well-defined. They are the following: (1) *The Kwa languages,* spoken on the coast of Upper Guinea between the lower courses of the Niger and St. Paul's River in Liberia. Their subgroups are: (*a*) Ewe-Akan group (Gold Coast, Togo, Dahome); (*b*) Lagoon group in the littoral regions of the Ivory Coast; (*c*) Kru group, reaching from the western Ivory Coast to the mouth of St. Paul's River; (*d*) Yoruba group; (*e*) Nupe group; (*f*) Ibo group; (*g*) Edo group; (*h*) Ijo (*d–h* in Nigeria). In the Kwa

languages the majority of word-stems consists of one consonant and one vowel. Akan *ka* "to remain," *wu* "to die." They have vocalic and nasal nominal prefixes, whose function is to form nouns out of verbs, and which are only absent in Kru. The prefixes do not form class divisions of the noun, except in rudiments.

(2) *Benue Cross River languages.* They partly coincide with Delafosse's Niger-Cameroons group and with Johnston's group A in his Bantu and Semi-Bantu languages, group (*b*) including Johnston's groups B–G, and group (*c*) comprising Johnston's group H The languages of this group have many stems which end in a consonant Efik *wut* "to kill" against Ewe *wu* "to kill." They have the same nominal prefixes as in group (1) (Efik *fime* "to blow," *o-fime* "wind"), but some languages have a system of prefixes which forms classes. As the group lies on the borderline between Sudanic and Bantu, some of its languages represent a stage of transition between the two.

(3) *Middle Togo group.* Most of these occupy a very small area, being situated in the mountainous region between the 7th and 8th degree N. lat.; some of them are disappearing or have already disappeared, being absorbed by Ewe and Akan. Among those which continue to exist are Avatime, Likpe, Adele, Kposso, Kebu The word-stems in this group consist mainly of one consonant and one vowel. Kposso *wu* "to kill." A class division of nouns is formed by prefixes; some languages use class-suffixes besides the prefixes The group stands between groups (1) and (4), having distinct connections with both.

(4) *Gur* (*Goor*) *languages,* in the northern section of the Ivory and Gold Coast, of Togo and of Dahome, and in the adjacent parts of Haute Volta. They include the following subgroups: (*a*) Mossi group (Mossi, Dagomba, etc.), (*b*) Grussi or Gurunsi group, (*c*) Tem group, (*d*) Bargu, (*e*) Gurma group, (*f*) Kilina, (*g*) Senufo or Siena group, (*h*) Songai. The latter is in fact an isolated language having its own type, but is remotely connected with the Gur languages. Stems of the form consonant plus vowel are very frequent, though perhaps not in the majority. Dyan *wu* "to kill." All have class division of nouns by suffixes; Gurma and Tem use prefixes and suffixes.

(5) *West Atlantic languages.* These are found in part of the territory between the Senegal and the Atlantic, with a number of enclaves farther east, and are sub-divided into an eastern group, comprising Temne, Bulom, Limba, Kissi, Gola and Adjukru, and a western group, represented by (*a*) Dyola, (*b*) the Bissao-Bolama cluster (Bola, Sarar, Pepel, Kanyop), (*c*) the Geba cluster (Biafada, Padjade), (*d*) Banyun, Nalu, Bulanda, (*e*) Konyagi, (*f*) Bidjogo, (*g*) Wolof and Serer. Neither in general type nor in phonology and etymology do the members of this group form such a close unit as those of the preceding group. Almost all have class division of nouns; some, as Bulom, Temne, Adyukru, by prefixes, Gola by prefixes and suffixes, Wolof and Serer have suffixes, but also change the beginning consonant, which perhaps points to prefixes. Stems consisting of a consonant and a vowel are frequent (Bulom *wu* "to die"), but they are in a minority.

(6) *Mandingo or Mande languages,* in the western Sudan between groups (4) and (5). They fall into two groups, named after the numeral for "ten" prevailing in each group: (*a*) *Mande tan,* with Bambara, Soninke, Malinke, Dyula, as main representatives, (*b*) *Mande fu,* comprising Susu, the Kpelle-Mende cluster, in Sierra Leone and Liberia (Mende, Kpelle, Gbande, Gbunde, Toma, Mano, Gio), Djalonka in French Guinea, and a number of small languages reaching as far east as the north-west corner of Nigeria (Boko-Busa). In the Mandingo tongues two-syllabic words prevail; many of these are compositions of two monosyllabic stems, each consisting of a consonant and a vowel. There are no word-forming prefixes, except in rudimentary forms. The word may often have a verbal and a nominal meaning: Bambara *ti* "thatch" and "to thatch."

**Bantu Languages.**—These, spreading through the southern half of the continent, form a closely united family with clearly defined features. Though the most prominent of these, the class division of nouns by prefixes, also exists in Sudanic groups, it has in Bantu reached a fuller development and has become the dominating factor in their structure. These prefixes also form the plural; thus *m-swahili* a Swahili, *wa-swahili,* Swahili people, *ki-swahili* the Swahili language The prefix belonging to a noun is repeated (though sometimes in a changed form) before every adjective, noun or pronoun agreeing with the noun; Swahili: *ki-su ki-kali ki-moja ki-me-potea* "knife sharp one has been lost": one sharp knife has been lost; *-su* "knife" has *ki-* as its class prefix, and this is repeated before every word agreeing with *-su* The plural prefix corresponding to *ki-* is *vi-;* thus the plural of the preceding sentence is: *vi-su vi-kali vi-nane vi-me-potea* "eight sharp knives have been lost." The main nominal classes are. (*a*) for "man as an independent personality"; (*b*) for "man in dependent position" (slave, messenger, workman), also for physical agents, spirits, diseases, parts of the human body, animals, plants; (*c*) for objects existing in double or divisible form, the plural also designating collectives and liquids, (*d*) for "customs, usages, tools"; (*e*) for animals; (*f*) for individual objects and abstract nouns; (*g*) for diminutives; (*h*) for infinitives; (*i*) (or rather three) for locatives Clicks (probably borrowed from Bushman and Hottentot) and lateral sounds are peculiar to some South African Bantu languages Intonation is in most tongues not so important as in the Sudanic family. Stress accent is more developed than in the latter, the accent lying generally on the penultimate. Two-syllabic stems are prevalent. There is no grammatical gender, sex being indicated as in Sudanic languages, and no case inflection. The genitive follows the governing noun. The verb has a large number of derivative forms, which afford a remarkable richness in expression, *e g.,* Swahili *vunja* "to break," *vunjika* "to be broken"; *penda* "to love," *pendana* "to love each other"; *takata* "to be clean," *takasa* "to cleanse"; from *pata* "to obtain" the following derivatives may be formed: *patana* "make an agreement," *patanisha* "unite," *patia* "obtain for somebody," *patika* "be seized," *patilia* "reach out for something," *patiliza* "make one vexed," *patilizina* "vex each other."

It is more difficult to group the Bantu languages in subdivisions than the Sudanic languages, where the evolution of independent types is evident at first sight.

According to Homburger, Bantu is divided into the following groups (of the individual languages belonging to each group only a certain number can be mentioned here): (1) Northern or Ganda group (Ganda, Nyoro, Kerewe. (2) Ruanda group (Ruanda, Rundi). (3) North-eastern or Kilimanjaro group (Kikuyu, Kamba, Djagga, Moshi, Siha). (4) Northern group of the east coast (Taveta-Taita, Chassu, Pokomo, Nika, Shambala, Bondei, Zigula, Swahili, Comore, Zaramo, Kami, Matumbi). (5) East African group (Nyamwezi, Nyaturu, Gogo, Hehe, Pogoro, Kaguru, Konde, Yao, Nyanja, Sene, Tete, Chwabo or Kilimane). (6) South-eastern group (Makua, Ronga or Thonga, Gwamba or Hlengwe, Chopi or Lenge, Venda, Sotho, Kololo, Chwana). (7) Zulu group (Kafir or Xosa, Zulu, Tebele, Ngoni). (8*a*) Central group (Tabwa, Bemba, Mambwe, Bisa or Wisa, Lala-Lamba, Senga, Tonga, Subiya). (8*b*) Western group (Herero, Ndonga, Kwanyama, Nyaneka, Mbunda, Luyi, Umbundu, Kimbundu, Lunda, Luba or Lua). (9) Congo group (Congo, Kanioka, Kutsu, Kele, Lolo, Nkundu). (10) North-western group (Bangi, Teke, Kalai or Kele, Galoa, Duma, Benga, Noho, Basa, Duala, Bube, Kwiri, Isubu). This division appears to call for a new investigation based on a careful observation of sound-shifting, for which a good start has been made by van Warmelo in his study on South African Bantu languages.

**Hamitic Languages.**—These represent a linguistic type which is more closely allied with the Semitic than with any other group of African languages. Their main divisions are (1) Eastern Hamitic in north-east Africa, including, among others: Bedauye, Bogos, Danakil, Somali, Galla, Agau, Kaffitsho. (2) Niloto-Hamitic: Masai, Ndorobbo, Tatoga, Nandi, Suk, Turkana, Gimirra. (3) Western Hamitic: The Berber dialects from western Morocco to the oasis of Siwa, Tuareg, and probably the extinct language or languages of the Guanches on the Canary islands. Hausa (*q.v.*), may be called a remoter member of this sub-group. Though it has adopted many elements from neighbouring Sudanic tongues,

its Hamitic affinity cannot be doubted. Hottentot in South Africa also shows certain Hamitic features, but recent investigations, especially those undertaken by Schapera, reveal such undeniable affinities between the Hottentot and Bushman languages (*q.v.*), as can hardly be explained by borrowing, but seem to point to a genetic relation between the two. Distinction of sex, always one of the prominent reasons for including Hottentot in the Hamitic family, is also found in Naron, a Bushman tongue, being in both cases expressed by a suffix. Both Nama and Naron have a dual form besides singular and plural, *|xam* and Nama have inclusive and exclusive forms of the first person plural (including or excluding the person addressed) There are other common features in grammar and a considerable number of words common to both. Schapera's conclusion is "that in spite of the many noticeable differences between them the Hottentot and Bushman tongues must be regarded as belonging to one and the same family of languages."

The characteristic features of Hamitic speech are: (1) Grammatical gender. Schilh masc. *idilli,* fem. *t-idilli-t* "black," Masai *ol dia* "male dog," *e⁊ dia* "female dog," Nama *khoib* "man," *khois* "woman," Hausa *ya* "he," *ta* "she." (2) a richness in plural formation, which may form such distinctions as distributive, collective, general and universal plurality. Bilin *dimmū-rā* "an individual of the cat family," pl. *dimmū-t;* but: *dimmū* "cat," pl. *diāmū* "cats." Chamir *ieslemā* "a Muslim," pl. *ieslem-en,* but *ieslem-en-t* "the Muslim world." In Hausa (*q.v.*), most nouns have several plural forms; *kunba* "finger-nail" has the plural forms *kunbōbī, kunbuna, kunbai, kunbaibai.* Here as in other Hamitic (and Sudanic) languages re-duplication is frequently used in forming the plural. (3) Inner vowel change (ablaut): Shilh *iliwi,* pl. *ilaw-an* "thorn"; *a-fulu,* pl. *i-fel-en* "string" (the changes are, however, caused by vowel-assimilation, and are thus a phenomenon found likewise in Sudanic languages); in verbs: Shilh *of-aji* "I find," *ufi-ji* "I have found." (4) As in Bantu, the genitive follows the governing noun. In Hottentot, however, as in Bushman and Sudanic (and also Bedauye), the possessor precedes the possessed.

**Fulfulde.**—Meinhof includes Fulfulde, the language of the Fulbe, in the Hamitic family, but calls it Proto-hamitic or Prehamitic. Fulfulde has the usual Hamitic genitive position, in which the governing noun precedes the genitive, but other features regarded as Hamitic are absent. Fulfulde has no grammatical gender; there is no different plural form of nouns, and there is no inner vowel change. It is decidedly a class language, *i.e.,* like Bantu and many Sudanic languages it divides nouns into classes by affixes, and this fact separates Fulfulde from the Hamitic stock and draws it near Bantu languages and the Sudanic class languages. The connection between Fulfulde and Bantu is recognized by Meinhof, his opinion being that "originally in the whole of the present Bantu region languages of a Sudanic type were spoken, until from the north tribes with a language similar to Fulfulde penetrated and made themselves lords over the old inhabitants. The result of a mixture of these two elements was Bantu." (c D. Kolonial-Lexikon i. p. 133.) The essential identity of the class-affixes as used in Fulfulde, in Sudanic class languages and in Bantu, in their etymological form as well as in their function, is evident, while in point of vocabulary Fulfulde and Bantu differ widely.

On the other hand there is an original affinity between Bantu and Sudanic languages. This refers not only to class-affixes, but also and still more to etymology. The two families have a considerable number of word-stems in common, and also certain formative elements, apart from class-affixes, are identical in both families.

The situation may be summed up as follows: The Negro population of Africa, comprising the Bantu and the Sudanic speaking peoples, has in etymology and in a number of formative elements a common linguistic substratum. The class division of nouns existing in Fulfulde, in Bantu and in certain Sudanic languages is evidently of common origin, where or from what language it may have originated we do not know.

According to Struck, the number of African languages is as follows: Bushman 11, Sudanic 264, Bantu 182, Hamitic 47, Semitic 10. Many of these occupy a small area, and perhaps not more than 12 are spoken by more than a million people. From the practical point of view, some of the most important African languages are (Semitic): Amharic, Arabic; (Hamitic): Hausa; (Bantu): Ganda, Kikuyu, Kongo, Luba-Lulua, Mbundu, Ngala, Nyanja, Sukuma-Nyamwezi, Ruanda-Rundi, Sotho-Pedi-Chwana, Swahili, Swina-Karanga-Ndau, Zulu-Xosa; (Sudanic): Akan, Dinka-Nuer, Efik-Ibibio, Ewe-Aneho-Dahome, Ibo, Kanuri, Kpelle-Mende, Malinke-Djula-Bambara, Mossi-Dagomba, Nupe-Gbari, Temne, Wolof, Yoruba, Zande.

**AFRICAN LILY** (*Agapanthus Africanus*), a member of the family Liliaceae, a native of the Cape of Good Hope, from which source it was introduced at the close of the 17th century. It is a handsome greenhouse plant, which is hardy in the south of England and the warmer parts of the United States. The basal, tufted leaves are long, narrow, arching, ½ to 2 ft. long. A central flowerstalk, 2 to 3 ft. high, ends in an umbel of bright blue, funnel-shaped flowers. The plants are easy to cultivate and are generally grown in large pots or tubs which must be protected from frost in winter. During the summer they require plenty of water and are very effective on the margins of lakes or running streams, where they thrive admirably. It may be propagated by dividing the rootstock in early spring or autumn. Dwarf and white-flowered forms are known in cultivation.

**AFRICANUS:** *see* SCIPIO.

**AFRICANUS, SEXTUS** [illegible], a Christian traveller and historian of the 3rd century, was probably born in Libya and lived at Emmaus. He may have served under Septimius Severus against the Osroenians in A.D. 195. He wrote a history of the world (*Χρονογραφίαι*, in five books) from the creation to A.D. 221, calculating the period between the creation and the birth of Christ as 5,499 years, and ante-dating the latter event by three years. This method of reckoning, known as the Alexandrian era, was adopted by almost all Eastern Churches. The history, which had an apologetic aim, is no longer extant, but copious extracts from it are to be found in the *Chronicon* of Eusebius. There are also fragments in Syncellus, Cedrenus and the *Paschale Chronicon*.

Eusebius also gives a letter to Aristeides, and one to Origen, impugning the authority of the book of Susanna. The ascription to Africanus of the *Κεστοί*, a work on agriculture, natural history, military science, etc., has been disputed. Neander suggests that it was written by Africanus before he had devoted himself to religious subjects. For a new fragment of this work see *Oxyrhynchus Papyri* (Grenfell and Hunt), iii. 36 *et seq*

**AFRĪDI,** the most powerful of the Pathān tribes inhabiting the mountains on the northwest frontier of Pakistan, though less numerous than the Wazīrs. They occupy the eastern spurs of the Safed Koh. Through the north of these runs the Khyber pass, and their centre is the great upland country called Tirah, 6,000 or 7,000 ft. above sea level, of which the Orakzais hold the southern half. The Afrīdi borders are the Peshawar district on the east and north, the Mohmands on the north, the Shinwāris on the west and the Orakzais and Bangash on the south, including the valleys of Bārā and Bāzār. The origin of the Afrīdis is unknown. They have a curiously Jewish cast of features, but have been supposed to be the Aparytai of Herodotus, though for more than 2,000 years their history is untraceable. It is, however, certain that about the 15th century they ousted the Tirahis, doubtless absorbing some of their elements; but their conquests were encroached upon by their neighbours, and it was not until Jahangir's reign that they retook half of Tirah from the Orakzais. Under Akbar they embraced the Roshanīa heresy, but after its suppression they enlisted freely in the Mogul armies and were subsidized to keep open the Khyber pass. But they failed to defend it against Nadir Shah, and were content to levy toll on such trade as filtered through it during the Abdāli and Sikh regimes. On the British annexation their independence was respected, in spite of their appeal to the Indian government to take Tirah, and they were subsidized to protect trading caravans travelling through the Khyber, but their internal feuds rendered it unsafe. In 1897 the Afrīdis enrolled in the Khyber militia made a gallant defense of Landi Kotal, but eventually surrendered. The defection of one of their most turbulent clans, the Zakka Khel, soon involved the whole tribe and the Orakzais as well. This necessitated a regular invasion of Tirah under Sir William Lockhart, and after much hard fighting every part of the country was traversed and surveyed, all the disaffected sections of the tribes being punished, the Zakka Khel being the last to submit. In 1908 an expedition had again to be launched against the Jawakki Khel. The Afrīdis are intensely democratic, the heads of clans having little authority, so that raiders cannot be brought to book or tribal engagements enforced. The tribe has furnished many good soldiers in the Indian army.

ORIENT AND OCCIDENT PHOTO

AN AFRĪDI TRIBESMAN ON THE INDO-AFGHAN BORDER, WITH HIS HOME-MADE "MAUSER"

(H. A. R.)

**Military Operations.**—There were several British expeditions against the separate clans:

1. Expedition against the Kohat pass Afrīdis under Sir Colin Campbell in 1850. The British connection with the Adam Khel Afrīdis commenced immediately after the annexation of the Peshawar and Kohat districts Following the example of all previous rulers of the country the British agreed to pay the tribe a subsidy to protect the pass But in 1850 1,000 Afrīdis attacked a body of sappers engaged in making the road, killing 12 and wounding 6 It was supposed that they disliked the making of a road which would lay open their fastnesses to regular troops. An expedition of 3,200 British troops was dispatched, which traversed the country and punished them.

2. Expedition against the Jowaki Afrīdis of the Bori villages in 1853. When the Afrīdis of the Kohat pass misbehaved in 1850, the Jowaki Afrīdis offered the use of their route instead; but they turned out worse than the others, and in 1853 a force of 1,700 British traversed their country and destroyed their stronghold at Bori. The Jowaki Afrīdis are a clan of the Adam Khel, who inhabit country between the Kohat pass and the Indus.

3. Expedition against the Aka Khel Afrīdis under Colonel Craigie in 1855. In 1854 the Aka Khel, not finding themselves admitted to a share of the allowances of the Kohat pass, commenced a series of raids on the Peshawar border and attacked a British camp. An expedition of 1,500 troops entered the country and inflicted severe punishment on the tribe, who made their submission and paid a fine.

4. Expedition against the Jowaki Afrīdis under Colonel Mocatta in 1877. In that year the government proposed to reduce the Jowaki allowance for guarding the Kohat pass, and the tribesmen protested this by cutting the telegraph wire and raiding British territory. A force of 1,500 troops penetrated their country in three columns, and did considerable damage.

5. Expedition against the Jowaki Afrīdis under Brig. Gen. Sir Charles Paton Keyes in 1877–78. The punishment inflicted by the previous expedition did not prove severe enough, the attitude of the Jowakis continued the same and raids into British territory went on. A stronger force, therefore, of 7,400 British troops, divided into three columns, destroyed their principal villages and occupied their country for some time, until the tribe submitted and accepted government terms. The Kohat pass was afterward practically undisturbed.

6. Expedition against the Zakka Khel Afrīdis of the Bazar valley under Brig. Gen. John Adams Tytler in 1878. At the time of the British advance into Afghanistan, during the second Afghan War, the Zakka Khel opposed the British advance and attacked their outposts. A force of 2,500 British troops traversed their country, and the tribesmen made their submission.

7. Expedition against the Zakka Khel Afrīdis of the Bazar valley under Lieut. Gen. Sir. Frederick Francis Maude in 1879. After the previous expedition the Afrīdis of the Khyber pass had continued to give trouble during the progress of the second Afghan War, so another force of 3,750 British troops traversed their country, and after suffering some loss the tribesmen made their submission. After this both the Khyber and Kohat passes were put on a stable footing, and no further trouble of any consequence occurred in either down to the time of the frontier risings of 1897, when the Afrīdis attacked the Khyber, which was defended by Afrīdi levies.

8. For the Tirah campaign of 1897 *see* TIRAH.

9. In Feb. 1908 the restlessness of the Zakka Khel again made a British expedition necessary.

During World War I the danger of a rising was averted by the decision to double the Afrīdis' allowances. They joined forces with the Afghans in 1919. After their submission in 1921 they cooperated in the construction of the Khyber railway.

Davies, "British Relations with the Afrīdis of the Khyber and Tirah," *Army Quarterly*, vol xxiii, 2 (London, 1932) (C. LI.)

**AFRIKANDER BOND,** a party, founded in Cape Colony by the Rev. S. J. du Toit in 1879, aiming at federating South Africa in one independent republic. The official optional use of

Dutch in parliament and the law courts was secured, but under the leadership of Hofmeyr and the influence of Cecil Rhodes its anti-British sentiments were greatly modified. It was always, however, essentially an organization for the promotion of the political supremacy of the Cape Dutch. (*See* also HOFMEYR, JAN HENDRIK; CAPE PROVINCE; and SOUTH AFRICA, UNION OF.)

**AFTERBIRTH,** a term used to include the placenta, foetal membranes and umbilical cord. They are usually expelled from the womb in a single mass 15 to 30 minutes after the birth of the child. The placenta is a soft, beefy red disk, about 8 to 10 in. in diameter and 1 to 1½ in. in thickness. It is the organ by which the mother nourishes the child and is composed largely of capillary loops from mother and child, in close contact. While the mother's blood does not pass into the blood vessels of the child, the constituents necessary for growth pass through the capillary walls into the child's circulation by a process called osmosis, while the waste products in the foetal blood pass in the other direction and are eliminated by the mother. One surface of the placenta is attached to the inside of the womb, whence it draws its maternal blood. The other surface presents the branching blood vessels of the foetus which unite into one artery and two veins. These vessels form the umbilical cord, which usually starts from the middle of the placenta and enters the body of the foetus at the navel. It is about 22 in. long. Around the edge of the placenta can be found the thin torn membrane which envelops the foetus in the womb. It forms the water bag in which the foetus floats, and usually breaks shortly before the birth of the child. If, however, the child is born with the membranes intact, he is said to be born in a caul.

**AFTERDAMP,** in coal mining, a name given to the poisonous choking gas which forms after a mine explosion. It mainly consists of carbon dioxide, and is also known as chokedamp. (*See* CHOKE-DAMP.)

**AFTERGLOW,** a broad high arch of radiance or glow seen occasionally in the western sky above the highest clouds in deepening twilight, or reflected from the high snowfields in mountain regions long after sunset. It is caused by very fine particles of suspended dust in the high atmosphere exercising a scattering effect upon the components of white light. After the eruption of Krakatoa in 1883, a remarkable series of red sunsets appeared all over the world. These were consequent on the spread by atmospheric currents of huge quantities of fine volcanic dust.

**AFTERIMAGE,** the immediate recurrence of a sensation, in like or opposite quality, after the removal of its stimulus. Afterimages are most prominent in vision. If a person gazes steadfastly at a small coloured object for half a minute and then turns his eyes away to a neutral background, he will notice a small coloured spot of complementary hue and brightness. These are called negative afterimages. If the object was red, the afterimage is bluish green; if it was emerald green, the afterimage is pink; if it was dark, the afterimage is light. Positive afterimages resemble the stimulus in brightness and hue and usually last only a few seconds. They are favoured by intense illumination in the stimulus, occurring after the eye has been in the dark. Positive afterimages occur from pressure, temperature and the sensations of bodily movement and posture. There are no afterimages from sounds or odours. (*See* VISION.)

**AFZELIUS, ADAM** (1750–1837), Swedish botanist, was born at Larf, Västergotland, Oct. 8. He founded the Linnaean institute at Uppsala in 1802, and in 1812 became professor of materia medica at the university. From 1792 he had spent some years on the west coast of Africa, and in 1797–98 he acted as secretary of the Swedish embassy in London.

Afzelius died at Uppsala in 1837.

In addition to his various botanical writings he published the autobiography of Linnaeus in 1823.

His brother JOHAN AFZELIUS (1753–1837) known as *Arvidson,* was professor of chemistry at Uppsala; and another brother, PER AF (1760–1843), who became professor of medicine at Uppsala in 1801, was distinguished as a medical teacher and practitioner.

**AFZELIUS, ARVID AUGUST** (1785–1871), Swedish poet, historian and mythologist. From 1828 till his death he was parish priest of Enköping. He collaborated with the learned historian, Erik Gustaf Geijer, in the great collection of Swedish folk songs, *Svenska folkvisor från forntiden* (1814–16). He published also translations of the *Sämunder Edda* and *Herwara-Saga* and a history of Sweden to Charles XII (of which a German translation was published in 1842), as well as original poems.

**AGA** or AGHA, a word, said to be of Tatar origin, signifying a dignitary or lord. Among the Turks it was applied to the chief of the janissaries, to the commanders of the artillery, cavalry and infantry and to the eunuchs in charge of the seraglio. It was also employed generally as a term of respect in addressing wealthy men of leisure, landowners, etc.

**AGADE,** the capital city of "Sargon of Agade." The city is probably identical with Tal-ed-Deir, excavated by Sir E. A. Wallis Budge in 1891. The inscriptions suggest that it was near Sippar, and Langdon identifies it with Sippar-Yakhuru, admitting, however, that the identification is uncertain. At ed-Deir is a massive city wall forming two sides of a triangle; the third side was formed either by the Euphrates or by a canal. The main gate was at the western apex of the triangle. The city appears to have been constructed all at once, primarily as a fortress. Sargon, who is said to have been a gardener of Semitic origin at Kish, overthrew the Sumerian power of Kish and changed his capital to Agade.

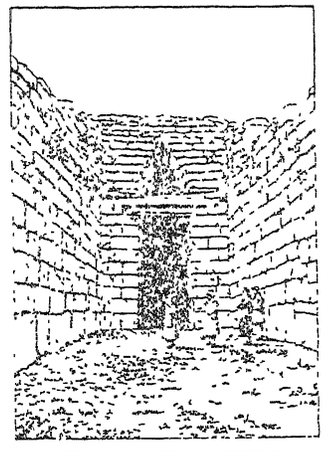
BIBLIOGRAPHY.—E. A. Wallis Budge, *By Nile and Tigris* (1920); S. Langdon, *Excavations at Kish* (1924).

**AGADIR,** a town of French Morocco on the Atlantic coast, 6 mi. N. of Wadi Jus. Pop. 5,626. It was the scene of Portuguese fisheries from 1500 and became a commercial centre. It came into prominence during the Moroccan crisis of 1911; in 1912 it passed to France. It has the natural facilities for the best harbour on the Atlantic coast of Morocco, but these remain undeveloped.

**AGA KHAN I,** HIS HIGHNESS THE (1800–1881), the title accorded by general consent to HASAN ALI SHAH (born in Persia, 1800), when he settled in Bombay under the protection of the British government. He was believed to have descended in direct line from Ali by his wife Fatima, the daughter of the prophet Mohammed. Ali's son, Husain, having married a daughter of one of the rulers of Persia before the time of Mohammed, the Aga Khan traced his descent from the royal house of Persia from the most remote, almost prehistoric, times. His ancestors had also ruled in Egypt, as caliphs of the Beni-Fatimites for a number of years, at a period coeval with the crusades. Before the Aga Khan emigrated from Persia, he was appointed by Fateh Ali Shah to be governor general of Kerman and ruled with firmness, moderation and high political sagacity. At last, however, he incurred the mortal displeasure of Fateh Ali Shah. He fled from Persia and sought protection in British territory, preferring to settle down eventually in India, making Bombay his headquarters. In crossing over from Persia through Afghanistan the Aga Khan found opportunities of rendering valuable services to the British army in Afghanistan and thus cast in his lot with the British. A few years later he rendered conspicuous services in the course of the Sind campaign, when he helped Sir Charles Napier in the process of subduing the frontier tribes, a large number of whom acknowledged the Aga's authority as their spiritual head. When he finally settled down in India, his position as the leader of the large Isma'iliah section of Mohammedan British subjects was recognized by the government, and the title of "his highness" was conferred on him, with a large pension. From that time until his death in 1881 the Aga Khan continued to discharge his sacerdotal functions, not only among his followers in India, but toward the more numerous communities which acknowledged his religious sway in Afghanistan, Khurasan, Persia, Arabia, central Asia, and even distant Syria and Morocco. He remained loyal to the British *raj,* and his vast and unquestioned influence among the frontier tribes on the northern borders of India proved of great service in the several expeditions led by British arms. He was also able to check the more turbulent Mohammedans in British India.

He was succeeded by his eldest son, AGA KHAN II. This prince continued the traditions and work of his father and was a member of the legislative council of Bombay.

AGA KHAN III (1877– ) (Aga Sultan, Sir Mohammed Shah), only son of the foregoing, succeeded him in 1885. He was born in 1877 and, under the care of his mother, a daughter of the ruling house of Persia, was given not only the indispensable religious and oriental education but a sound European training. The Aga Khan headed the Moslem deputation in 1906 to the viceroy, Lord Minto, which submitted the case for encouraging abandonment of the studied aloofness of their community from Indian political life; and he was president of the All-India Moslem league, thereupon formed, during its first constructive years. He initiated the fund for raising the Mohammedan college at Aligarh to university status, which was effected in 1920. In the immediate prewar years he did much to soothe Indian Moslem sentiment in respect to the Italo-Turkish and two Balkan wars. He was touring among his followers in east Africa, when World War I broke out; immediately he cabled to the *jamats* or councils of the millions of Isma'iliahs within British territories and on their borders directing his followers to place themselves unreservedly at the disposal of the British authorities. When Turkey was drawn into the struggle the Aga Khan issued a stirring manifesto showing that the Allies had no overt designs on Islam and calling upon the Moslems of the empire to remain loyal and faithful to their temporal allegiance. His influence was reinforced by his intimate contact with leading Allied statesmen and the breadth and liberality of his outlook on the problems of reconstruction. His study of Indian and middle eastern affairs in *India in Transition* (1918) was not without considerable effect in the final shaping of reforms under the India act of 1919, and was consistent in broad principle with his postwar criticisms of the British government's Mesopotamian and Arabian policy.



The Aga Khan joined in many representations, public and private, both at the Paris conference and subsequently, as to the immense importance to Great Britain, the ruler of the greatest aggregation of Moslems in the world, of not depriving Turkey of a real [illegible] existence. To the G.C.I.E. and the G.C.S.I. already [illegible] on him there was added in 1916 a salute of 11 guns and the rank and status of a first-class chief of the Bombay presidency, the only previous instance of the grant of a salute outside the Indian territorial ruling families being that of the first Salar Jung. In 1930 and 1931 he was chairman of the British Indian delegation to the Round Table conference held in London to discuss Indian constitutional development. He also represented India at the World Disarmament conference in Geneva in 1932. He led the Indian delegation to the League of Nations assembly from 1932 to 1937 and was the first Indian to be appointed president of the League assembly (1937). Known moreover to the public as a successful breeder and trainer of race horses, the Aga Khan won the Derby with Blenheim in 1930 and with Mahmoud in 1936; and in 1935 his horse Bahram won the Triple crown by carrying off the Two Thousand Guineas, the Derby and the St. Leger.

*See* N. M. Dumasia, *The Aga Khan and His Ancestors* (Bombay, 1939).

**AGALMATOLITE,** a soft variety of the mineral pyrophyllite ($HAlSi_2O_6$), also called *pagodite,* used by the Chinese for carving, especially into grotesque figures (whence called "figure-stone").

**AGAMEDES,** in Greek legend, king of Orchomenus in Boeotia. He and his stepbrother Trophonius were skilled architects and constructors of underground shrines and treasure houses. When building a treasure house for the Boeotian king, Hyrieus, the brothers fixed one of the stones in the wall in such a manner that they could remove it whenever they pleased and help themselves to the treasure. Hyrieus set a trap in which Agamedes was caught; Trophonius to prevent discovery cut off his brother's head and fled with it. He was pursued by Hyrieus, and swallowed up by the earth in the grove of Lebadeia. On this spot was the oracle of Trophonius in an underground cave; those who wished to consult it, first offered a ram and called upon the name of Agamedes. A similar story is told of the treasure of Rhampsinitus by Herodotus (ii, 121). The brothers built the temple of Apollo at Delphi. When they asked for a reward, the god promised them one in seven days; on the seventh day they died.

**AGAMEMNON,** a Homeric hero, son of Atreus, and Aërope, grandson of Pelops, great-grandson of Tantalus and brother of Menelaus. After the murder of Atreus (*q.v.*), Agamemnon and Menelaus took refuge with Tyndareus, king of Sparta, whose daughters, Clytaemnestra and Helen, they respectively married. By Clytaemnestra, Agamemnon had three daughters, Iphigeneia (Iphianassa), Electra (Laodice), Chrysothemis, and a son, Orestes. Menelaus succeeded Tyndareus, and Agamemnon, with his brother's assistance, drove out Aegisthus and Thyestes, and recovered his father's kingdom. He extended his dominion by conquest, and became the most powerful prince in Greece When Paris (Alexander), son of Priam, had carried off his brother's wife, he went around to the princes of the country and called upon them to unite in a war of revenge against the Trojans. He himself furnished 100 ships, and was chosen commander in chief of the combined forces The fleet, numbering 1,200 ships, assembled at the port of Aulis in Boeotia, but was prevented from sailing by calms or contrary winds. Calchas announced that the wrath of Artemis could only be appeased by the sacrifice of Iphigeneia (*q.v.*). The fleet then set sail.

BY COURTESY OF AMERICAN WOMEN'S HOSPITALS

THE TOMB AT MYCENAE, GREECE, KNOWN FOR YEARS AS THE TREASURE HOUSE OF ATREUS, AND CALLED THE TOMB OF AGAMEMNON

Little is heard of Agamemnon until his quarrel with Achilles (*q.v.*). After the capture of Troy, Cassandra, the daughter of Priam, fell to his lot in the distribution of the prizes of war. On his return, after a stormy voyage, he landed in Argolis. Aegisthus, who in the interval had seduced his wife Clytaemnestra, treacherously slew him with her help, Cassandra also perishing. The murder of Agamemnon was avenged by his son Orestes (*q.v.*). Agamemnon is quite possibly a more or less historical character, overlord of the Mycenaean or Achaean states of the Greek mainland. In Hellenistic times, at Sparta, he was worshipped under the title of Zeus Agamemnon. His tomb was pointed out among the ruins of Mycenae and at Amyclae.

**AGANA,** the capital and largest of 15 cities of the island of Guam, is located on the central portion of the island's west coast, on a sandy beach surrounding Agana bay and at the mouth of the small Agana river. The city is about 5 mi. N.E. of Piti, the port of entry for water shipments with which it is connected by road. Before World War II about half of the population of Guam lived in Agana; the city's 1940 population was 10,004. During the war Agana and many other towns and villages were destroyed and their populations dispersed. The Guam Planning commission was established after the war to rebuild the capital. The city's non-American population is almost entirely Chamorro. The mean annual temperature is about 81° F., and is nearly constant throughout the year. The municipal government is headed by a chief commissioner, a native popularly elected for a four-year term. The city is divided into ten districts or *barrios,* each of which is a group of households with its own chapel and exercising certain powers of local autonomy. Agana was the seat of government under Spain, which ruled Guam for 300 years; the U.S., which acquired the island on Feb. 1, 1899; and Japan, which occupied Guam from 1942 to 1944.

BIBLIOGRAPHY.—U.S. Navy Department, *Information on Guam Transmitted by the U.S. to the Secretary-General of the U.N. Pursuant to Article 73(e) of the Charter* (June 1949); Laura Thompson, *Guam and Its People* (1942). (S. NR.)

**AGAPĒ,** the early Christian love-feast (Gr ἀγάπη, "Love"). The word seems to be used in this sense in Jude 12, but *cf* 2 Pet. ii. 13, where the reading is ἀπάταις ("deceits") for ἀγάπαις. The history of the *agapē* coincides, until the end of the 2nd century, with that of the eucharist (*q.v.*), and Tertullian's detailed account (*Apology,* c. 39) of the *agapē* is not, perhaps, exclusive of an accompanying eucharist: "It is the banquet (*triclinium*) alone of the Christians that is criticized. Our supper (*coena*) shows its character by its name. It is called by a word which in Greek signifies love (*i.e., agapē*). Whatever it costs, it is anyhow a clear gain that it is incurred on the score of piety, seeing that we succour the poorest by such entertainments (*refrigerio*). We do not lie down at table until prayer has been offered to God, as it were a first taste. We eat only to appease our hunger, we drink only so much as it is good for temperate persons to do. If we satisfy our appetites, we do so without forgetting that throughout the night we must say our prayers to God . . . After washing our hands and lighting the lamps, each is invited to sing a hymn before all to God, either taken from holy writ or of his own composition. So we prove him, and see how well he has drunk. Prayer ends, as it began, the banquet."

This evidence is good for Africa. But in Egypt about the same time (180–210), Clement of Alexandria (*Paedagogus,* ii. 1) condemns the "little suppers which were called, not without presumption, *agapē.*" This word, he complains, should be used only for the eucharist, not for mere junketings, into which the love-feasts of the church had degenerated. Tertullian too in his tract on fasting (ch. xvii.) mentions grave scandals in connection with the *agapē.*

Ch. xiii. of the tract *About Virginity* (printed among the spurious works of Athanasius) describes a ritual meal which like that in 1 Cor. xi. is *agapē* and eucharist in one, and it is held in a private house, not in church, and the celebrants are holy women.

The historian Socrates (*Hist. Eccl.,* v. 22) records the survival (which he characterizes as singular), around Alexandria and in the Thebaid, of love-feasts combined with the eucharist. So Basil of Cappadocia (Ep. 93), *c.* 350, states that in Egypt the laity, as a rule, celebrated the communion in their own houses, and partook of the sacrament by themselves whenever they chose. In the old Egyptian church order, known as the *Canons of Hippolytus,* there are numerous directions for the service of the *agapē,* held on Sundays, saints' days or at commemorations of the dead. Chrysostom describes (homily 54, tom. v, p. 365) how after the eucharistic synaxis the faithful remained in church, while the rich brought out meats and drink from their houses, and invited the poor, and furnished "common tables, common banquets, common symposia in the church itself." The Council of Gangra (A.D. 343?) anathematized the over-ascetic people who despised "the *agapēs* based on faith." But the holding of *agapēs* in church was forbidden by the councils of Laodicea (363) and Carthage (under Aurelius, 388–423), and later by the council in Trullo (692). In the age of Augustine the *agapē* was frequent.

In the east Syrian, Armenian and Georgian churches, respectively Nestorian, Monophysite and Greek Orthodox in their tenets, the *agapē* was from the first a survival, under Christian and Jewish forms, of the old sacrificial systems of a pre-Christian age. Sheep, rams, bullocks and fowls are given sacrificial salt to lick, and then sacrificed by the priest and deacon, who has the levitical portions of the victim as his perquisite. In Armenia the Greek word *agapē* has been used ever since the 4th century to indicate these sacrificial meals, which either began or ended with a eucharistic celebration. The earlier usage of the Armenians is expressed in two rules recorded against them by a renegade Armenian prelate named Isaac, who in the 8th century went over to the Byzantine church (Combefisius, *Historia Monothelitarum,* col 317). Older mss. of the Greek Euchologion contain numerous prayers to be offered over animals sacrificed; and in the form of *agapē* such sacrifices were common in Italy and Gaul on the *natalis dies* of a saint, and Paulinus of Nola, in his Latin poems, describes them (c. 400) in detail. Gregory the Great sent to Mellitus, bishop of London, a written rite of sacrificing bulls for use in the English Church of the early 7th century. In Augustine's work against Faustus the Manichean (xx 4), the latter taxes the Catholics with having turned the sacrifices of the heathen into *agapēs,* their idols into martyrs, whom they worship with similar rites. The early Christian *agapē* admitted of adaptation to the older funeral and sacrificial feasts, and was so adapted. The association in the synoptics of the earliest eucharist with the paschal sacrifice provided a model, and long after the eucharist was separated from the *agapē* on other days of the year, we still find celebrated on the evening of Maundy Thursday the sacrifice of the paschal lamb, immediately followed by an eucharist. The council of Carthage enacted that the eucharist should be received fasting, except on the anniversary of the Lord's supper. It is clear that at an earlier date the *agapē* preceded the eucharist.

**Pagan Analogues.**—In ancient states common meals called *sussitia* (συσσίτια) were instituted, particularly in the Doric States; *e g.,* Lacedaemon and Crete. Plato advocated them, and perhaps the later Jews imitated the Spartan community. Trade and other guilds in antiquity held subscription suppers or ἔρανοι, similar to those of the early Corinthian Church, usually to support the needs of the poorer members. These *hetariai* or clubs were forbidden (except in cities formally allied to Rome) by Trajan and other emperors, as being likely to be centres of disaffection; and on this ground Pliny forbade the *agapē* of the Bithynian churches, Christianity not being a lawful religion licensed for such gatherings. The custom which most resembles the eucharist and *agapē* was that known as *charistia* described by Valerius Maximus ii. 1. 8. a solemn feast for members of one clan, at which those who had quarrelled were at the sacrament of the table (*apud sacra mensae*) reconciled. Ovid alludes to it (*Fasti,* ii. 617).

**AGAPEMONITES** or Community of the Son of Man. A sect founded in 1846 by the Rev. Henry James Prince, a clergyman of the Church of England (1811–1899). He studied medicine, obtained his qualifications in 1832 and was appointed medical officer to the general hospital in Bath, his native city. Compelled by ill-health to abandon his profession, he entered himself in 1837 as a student at St. David's theological college, Lampeter, where he gathered about him a band of earnest religious enthusiasts, known as the Lampeter Brethren, and was eventually ordained to the curacy of Charlinch in Somerset, where he had sole charge in the illness and absence of the rector, the Rev. Samuel Starkey. His work at this period reveals an almost hypnotic power over his converts; but soon he was mastered by delusions. He persuaded himself that he had been absorbed into the personality of God and had become a visible embodiment of the Holy Spirit. During his illness Mr. Starkey read one of his curate's sermons, and was not only "cured" forthwith, but embraced his strange doctrines, and together they procured many conversions in the countryside and the neighbouring towns. Forbidden the right to officiate in the Church of England, Prince and Starkey established themselves at Weymouth. Money flowed in; and with these resources they obtained the house at Spaxton, which became the "Abode of Love."

On the death of "Brother" Prince, the Rev. T. H. Smyth-Pigott, pastor of the "Ark,"—a branch church established at Clapton, London—became the acknowledged head of the sect. He was born in 1852, of an old Somersetshire county family, and, after a varied career as university man, sailor before the mast, soldier, coffee-planter, curate in the Church of England and evangelist in the Salvation Army, was converted about 1897 to the views of Prince. For five years after this he was not heard of outside his own sect. In Sept. 1902, however, he began to make claims similar to those of his predecessor, and proclaimed himself to be Christ. By the outside world the affair was greeted with mingled ridicule and indignation, and the new Messiah had to be protected by the police from the violence of an angry mob. Scandal was soon renewed through Pigott's relations with his female followers; and in Aug. 1908, an attempt to "tar and feather" him resulted in two men being sent to prison. Later in the month proceedings were instituted against him by the bishop of Bath and Wells under the Clergy Discipline Act.

*See* Law Reports, Court of Chancery, June 4–8, 1860; art. "Agapemone" in Hastings' *Encyclopaedia of Religion and Ethics.*

**AGAPETAE,** a name given to female Christian ascetics who dwelt with men under a vow of continency. This practice essentially belongs to the history of Christian asceticism. Its beginnings can be traced in the earliest Christian times, but it was preserved in monasticism down to the early middle ages.

*See* Hastings, *Encyclopaedia of Religion and Ethics,* "Agapetae"; *see* also ASCETICISM.

**AGAPETUS,** the name of two popes:

AGAPETUS I., pope from 535 to 536, collaborated with Cassiodorus in founding at Rome a library of ecclesiastical authors. King Theodahad sent him on an embassy to Constantinople, where he died, after having deposed Anthimus, the Monophysite bishop of that town, and ordained Menas his successor.

AGAPETUS II., pope from 946 to 955, at the time when Alberic, son of Marozia, was governing the independent republic of Rome under the title of "prince and senator of the Romans." He did his best to restore church discipline and to regain temporal power. His appeal to Otto the Great to intervene in Rome remained without immediate effect, since Alberic's position was too strong to be attacked, but it bore fruit after his death. Agapetus died on Nov. 8, 955.

**AGAPETUS,** a deacon of the church of St. Sophia at Constantinople, and author of a series of exhortations on the duties of a Christian prince, addressed (*c.* 527) to the emperor Justinian. The work was often reprinted, and has been translated into Latin, French and English.

**AGAR,** or AGAR-AGAR, is a gelatinelike product of red seaweeds, made from *Gelidium* and other agarophytes (agar-bearing plants) such as *Gracilaria, Ahnfeltia* and *Pterocladia.* It is best known as a bacteriological culture medium, and is extensively used for food, as roughage, and in making jelly desserts, confectionery, icings, salad dressings, and dairy products. It is employed in canning meat and poultry, in laxative preparations, as a constituent of medicinal pills and capsules, in numerous pharmaceutical and cosmetic creams and jellies, as a dental impression mould base, and in wire-drawing lubricants. Agar is prepared by boiling the agarophytes in water and subsequently purifying and drying the product. It is produced chiefly in Japan, and also in China, Russia, the United States, Mexico, South Africa, New Zealand and Australia It is amorphous and translucent, and may be found on the market in the form of powder, flakes, shreds, or bricks. Agar is insoluble in cold water, but swells considerably, absorbing as much as 20 times its own weight of water. It readily dissolves in boiling water, and is able to set to a firm gel at concentrations as low as ½%. Although a 1% agar sol solidifies at about 104° F., its gel does not melt until about 203° F., showing a striking case of hysteresis. Agar gels carry small negative electric charges. Like other gels, they exhibit syneresis. Chemically, agar is the sulphuric ester of a linear galactan, consisting of a long chain of *d*-galactose residues attached to each other by a 1, 3-glycosidic linkage. This chain is terminated by one *l*-galactose residue which is attached to the rest of the chain through carbon atom 4, and is esterified at carbon atom 6 with sulphuric acid There are probably as many as 53 galactose units to each $SO_4H$ group. In the natural state, agar occurs as a cell wall constituent of the agarophytes, probably existing in the form of its calcium salt, or a mixture of calcium and magnesium salts.

BIBLIOGRAPHY.—W. G. M. Jones and S. Peat, "The Constitution of Agar," *Jour. Chem. Soc,* 225–231 (1942); V. C. Barry and T. Thomas Dillon, "A Formula for Agar," *Chem. and Ind,* 167 (1944); C. K. Tseng, "Agar: A Valuable Seaweed Product," *Scientific Monthly,* 58: 24–32 (1944); C. K. Tseng, "Phycocolloids: Useful Seaweed Polysaccharides," in Jerome Alexander, *Colloid Chemistry,* vol. 6, *Technology and Applications of Colloids.* (C. K. T.)

**AGARIC,** the name applied to fungi with the spores borne on gills (mushrooms), from the generic name *Agaricus.* In pharmacology, a medicinal [illegible] from the fungus *Fomes officinalis,* a polypore growing principally on larch and pine.

**AGASIAS.** There were two Greek sculptors of this name. Agasias, son of Dositheus, signed the statue called the Borghese Warrior in the Louvre. Agasias, son of Menophilus, is the sculptor of another striking figure of a warrior in the museum of Athens. Both belonged to the school of Ephesus and lived about 100 B.C. (*See* Gardner, *Handbook of Greek Sculpture,* ii. p. 475.)

**AGASSIZ, ALEXANDER EMANUEL** (1835–1910), American man of science, son of J. L. R. Agassiz, was born in Neuchâtel, Switzerland, on Dec. 17, 1835. He came to the United States with his father in 1846; graduated at Harvard in 1855, subsequently studying engineering and chemistry, and taking the degree of bachelor of science at the Lawrence scientific school of the same institution in 1857; and in 1859 became an assistant in the U.S. coast survey. Thenceforward he became a specialist in marine ichthyology, but devoted much time to the investigation, superintendence and exploitation of mines, being superintendent of the Calumet and Hecla copper mines, Lake Superior, from 1866 to 1869, and afterwards, as a stockholder, acquiring a fortune, out of which he gave to Harvard, for the museum of comparative zoology and for furthering the study of biology at Harvard and elsewhere upwards of $1,000,000. In 1875 he surveyed Lake Titicaca, Peru, examined the copper mines of Peru and Chile, and made a collection of Peruvian antiquities for that museum, of which he was curator from 1874 to 1885. He assisted Sir Wyville Thomson in the examination and classification of the collections of the "Challenger" exploring expedition, and wrote the *Revision of the Echini* (1872–74) in the reports. Between 1877 and 1880 he took part in the three dredging expeditions of the steamer "Blake," of the U.S. coast survey, and presented a full account of them in 1888. Of his other writings on marine zoology, most are contained in the bulletins and memoirs of the museum of comparative zoology; but he published in 1865 (with Elizabeth Cary Agassiz, his stepmother) *Seaside Studies in Natural History,* a work at once exact and stimulating, and in 1871 *Marine Animals of Massachusetts Bay.* He died at sea on the "Adriatic" bound for the United States on March 27, 1910.

**AGASSIZ, JEAN LOUIS RODOLPHE** (1807–1873), Swiss-American naturalist, geologist and teacher, was born on May 20, 1807, the son of the Protestant pastor of Motier, on the shore of Lake Morat, Switzerland. His father was the last of a long line of clergymen, the first of the series having been driven from France by the revocation of the Edict of Nantes. His mother, Rose Mayor, was a gifted woman from whom especially he inherited his love of animals and plants. In boyhood he spent four years at the gymnasium in Bienne and later attended the academy at Lausanne. He then entered, successively, the universities of Zurich, Heidelberg and Munich. On completion of his academic courses, Agassiz took at Erlangen the degree of Doctor of Philosophy and at Munich that of Doctor of Medicine.

Although as a youth he gave some interested attention to the ways of the brook fish of western Switzerland, his permanent and lifelong interest in ichthyology arose from his being chosen to study the fishes of Brazil. In 1819 and 1820 two eminent naturalists of Munich, J. B. Spix and C. P. J. von Martius, had made an extensive tour in Brazil, bringing back a large collection of

fishes, mostly from the Amazon river The classification of these species was begun by Spix; he died in 1826, however, and the whole collection was then turned over by Martius to Agassiz. The work was completed and published in 1829, as *Selecta Genera et Species Piscium*. This splendid accomplishment was a monument to youthful industry and enthusiasm, the author being at that time only 22 years old The study of fish-forms became henceforth the prominent feature of Agassiz's scientific research. In 1830 he issued a prospectus of a *History of the Fresh Water Fishes of Central Europe*, a valuable contribution printed in parts from 1839 to 1842.

The year 1832 proved the most significant in Agassiz's early career, because it took him first to Paris, then the centre of

AFTER "RECHERCHES SUR LES POISSONS FOSSILES"

A FOSSIL FISH, ETCHED ON STONE UNDER AGASSIZ'S SUPERVISION, AFTER A SPECIMEN DISCOVERED DURING HIS RESEARCHES AT NEUCHÂTEL

general scientific as well as medical research, and afterwards to Neuchâtel where he spent many years of amazingly fruitful effort. While in Paris he lived the life of an impecunious student of the *quartier latin*, supporting himself, helped at times by the kindly interest of friends, such as Humboldt, who soon secured for him a professorship at Neuchâtel, and Cuvier, the most eminent ichthyologist of his time. At Paris his scientific activities largely centred in the Natural History museum of the great park now known as the Jardin des Plantes.

Already Agassiz had become interested in the rich stores of the extinct fishes of Europe, especially those of Glarus in Switzerland and of Monte Bolca near Verona, of which only a few at that time had been critically studied. As early as 1829, Agassiz planned a comprehensive and critical study of these remains. To this end he gathered material wherever possible. His epoch-making work, *Recherches sur les Poissons Fossiles*, appeared in parts from 1833 to 1844. In it the number of named fossil fishes was raised to nearly 1,000, and the ancient seas were made to live again through disclosure of their inhabitants. The great importance of this foundation work rests on the impulse given to the study of extinct life itself. Turning his attention to other extinct animals found with the fishes, Agassiz published in 1839–40 two quarto volumes on the fossil echinoderms of Switzerland, and later (1840–45) his *Études Critiques sur les Mollusques Fossiles*.

From 1832 to 1846 he served as professor of natural history in the University of Neuchâtel, where may still be found evident traces of the activity and enthusiasm of its youngest and most eager teacher. In Neuchâtel he acted for a time as his own publisher, his private residence even becoming a hive of activities. Numerous young men were co-workers with him, dividing between themselves the scanty returns from his lectures and publications. He now began his *Nomenclator Zoologicus*, a catalogue, with references, of all the names applied to genera of animals from the beginning of scientific nomenclature, a date since fixed at Jan. 1, 1758. "This," said Agassiz, "is a work of patience. It is a barrier against the Babel of confusion which threatens to overwhelm the domain of zoological synonomy." The practical value of the compilation can hardly be overestimated.

In 1836 Agassiz began a new line of studies, that of the movements and effects of the glaciers of Switzerland. Several writers had expressed the opinion that these rivers of ice had once been much more extensive, and that the erratic boulders scattered over the region and up to the summit of the Jura mountains, were carried by moving glaciers. On the ice of the Aar glacier he built a hut, the "Hôtel des Neuchâtelois," from which he and his associates traced the structure and movements of the ice. In 1840 he published his *Études sur les glaciers*, in some regards the most important of all his works. In it he was able to show that at a period geologically recent Switzerland was covered by one vast ice-sheet. His final conclusion was that "great sheets of ice, resembling those now existing in Greenland, once covered all the countries in which unstratified gravel (boulder drift) is found"

In 1846 Agassiz was led to visit the United States for the general purpose of studies in natural history and geology, but immediately to give a course of lectures in the Lowell institute in Boston. These were followed by another series in Charleston, and afterwards by lectures both popular and technical in various cities, his brilliant and engaging personality at once winning all hearts. In 1848 he accepted a professorship of zoology at Harvard university, and from that time on became more and more enthusiastically American. Indeed, half his scientific career, and that not the least important, was lived in this country. "He came in a spirit of adventure and curiosity; he stayed because he loved a land where he could think and act as he pleased; a land where nature is rich but tools and workmen are few, and traditions none."

In America his chief volumes of scientific research were the following: *Lake Superior* (1850); *Contributions to the Natural History of the United States* (1857–1863, in several quarto volumes, the most notable being on the embryology of turtles); and the *Essay on Classification*, a brilliant production, which, however, failed to grasp the trend of modern zoology. Besides these extensive contributions appeared a multitude of short papers on natural history and especially on the fishes of America. His two excursions of highest importance were, first, to Brazil in 1865, and second, to California in 1871, the latter trip involving both shores of South America. *A Journey in Brazil* by Mrs Agassiz and himself, published in 1868, gives a very interesting account of their experiences on the earlier voyage. His most important paper on American fishes dealt with the remarkable group of viviparous surf-fishes of California.

During many years, also, Agassiz was deeply absorbed in his cherished plan of developing at Harvard university a comprehensive museum of research in zoology. This institution, which was established in 1859 and ultimately grew into the present splendid museum of comparative zoology, enjoyed his fostering care during the rest of his lifetime. In America Agassiz's industry and devotion to scientific pursuits were as strongly marked as in Europe, but two other traits here assumed a much greater importance. As a teacher of science he was extraordinarily skilful, certainly the ablest America has ever known. In addition he was personally devoted to his students, who were in the highest sense co-workers with him—"the best friend that student ever had." His warmth of feeling moreover went out equally to colleagues and neighbours. It was said that "one had less need of an overcoat in passing Agassiz's house than any other in Cambridge." Such qualities, endeared him to all, while his amazing command of lucid and picturesque English impressed every listener. He was also as much at home before an audience of labourers or farmers as with the most erudite leaders of research.

Agassiz's method as teacher was to give contact rather than information. He discouraged the use of books except in detailed research. Among his favourite expressions were "If you study nature in books, when you go out-of-doors you cannot find her." "It's not text-books we want, but students. The book of nature is always open." "Strive to interpret what really exists." The result of his instruction at Harvard was a complete revolution in natural history study in America. The purpose came to be not a category of facts taken from others, but the ability, through contact, to gather the needed facts. As a result of his activities

every notable teacher of natural history in the United States for the second half of the 19th century was at some time a pupil of Agassiz or of one of his students.

In the interests of better teaching and of scientific enthusiasm, he organized in the summer of 1873 the Anderson school at Penikese, an island in Buzzard's bay. The details of this remarkable venture, brief in actual period but having a profound effect on science teaching and the precursor of all American summer schools and establishments for marine research, cannot be given here. But "the school of all schools which has had the greatest influence on science teaching in America was held in an old barn on an uninhabited island, 18 miles from the shore; it lasted but three months; it had virtually but one teacher. It existed in the personal presence of Agassiz. When he died, it vanished." (David Starr Jordan, *Agassiz at Penikese.*)

As Agassiz was beyond question one of the ablest, wisest and best informed of the biologists of his day, it is often asked why his attitude towards Darwinism was, throughout all his lifetime, cold and unsympathetic. It seems possible that his position was determined in part by a misunderstanding, but more particularly by his philosophy of biology. He seemed to regard Darwinism as a theory of continued progress instead of one of divergence, tempered by the weeding out of unadapted individuals. He failed to recognize the importance of separation and segregation in the development of new specific forms. He once said that in his studies of fossils he "was on the verge of anticipating Darwinism," but was withheld by the discovery that "we had the higher fishes first." In a sense this was true, for the brain development of the sharks is higher, as a whole, than that of the bony fishes. But the latter are far more specialized in fitness for aquatic life. More important to Agassiz was the fact that in his philosophy each species of animal or plant was in itself "a thought of God." Their homologies or fundamental unities were "associations of ideas in the Divine Mind." He had an intensely religious mind, although he was totally out of sympathy with sects and creeds and the outer shell of Christianity.

In physical appearance Agassiz was a striking figure, nearly six feet tall, compactly built, with noble head and broad handsome face, usually illuminated by an especially charming smile. This last, however, would suddenly turn into a frown in the presence of careless or trivial work or pretence on the part of a student. He married twice. His first wife, Cecile Braun, was the sister of an eminent botanist. In 1850, after his first wife's death, Agassiz married Elizabeth Cabot Cary, of Boston, well known as a writer and as a promoter of the education of women.

Agassiz died on Dec. 12, 1873. He was buried in Mt. Auburn at Cambridge, and by his grave stands a boulder from the moraine of the Lauteraar. At his death, Theodore Lyman, one of his students, wrote, "We buried him from the chapel that stands among the college elms. The students laid a wreath of laurel on his bier and their manly voices sang a requiem. For he had been a student all his life long, and when he died he was younger than any of them."

(D. S. J.)

**AGATE**, a term applied, not to a distinct mineral species, but to a group of amorphous and crypto-crystalline forms of silica. According to Theophrastus the agate (ἀχάτης) was named from the river Achates, now the Drillo in Sicily, where the stone was originally found. Most agates occur in eruptive rocks or ancient lavas where they fill the cavities which were produced by the liberation of gas during the solidification of the molten rock. These agates have a banded structure, successive layers being approximately parallel to the sides of the cavity. A number of varieties of agate are characterized by peculiarities in the shape and colour of the bands, which are seen in sections cut at right-angles to the layers. In riband-agate they are straight or slightly curved. Such an agate with cloudy bands alternating with bands of another colour, the two sets being sharply marked off from one another, is known by the general term onyx. A ring or eye agate is one in which the differently coloured bands are disposed in concentric circles. A Mexican agate, showing only a single eye has received the name of "cyclops." When the banding forms re-entrant and salient angles, its outline resembling that of the plan of a fortress, it is called fortification-agate. Certain agates also occur, to a limited extent, in veins, of which a notable example is the beautiful brecciated agate of Schlottwitz, near Wesenstein in Saxony—a stone mostly composed of angular fragments of agate cemented with amethystine quartz. A variety having included matter of a green colour, embedded in the agate and disposed in filaments and other forms suggestive of vegetable growth, is known as moss agate. Dendritic markings of black or brown colour, due to infiltration of oxides of manganese and iron, produce the variety known as Mocha stone.

It is probable that agates occurring in cavities in igneous rocks have been formed in a number of ways, and various theories of their origin have been proposed. The theory which is now generally accepted is as follows. During the solidification of the rock an accumulation of gas or steam causes a bubble to form. Long after, when the rock has solidified, water carrying silica in solution, probably as alkali silicate, penetrates into the region where the bubble is located. It then diffuses into the cavity and subsequently the solution coagulates to a silica gel. The alkali present with the silica attacks the iron-bearing rock surrounding the cavity, giving rise to iron salts. These diffuse into the silica gel and produce the regular layers of iron hydroxide after the manner of Liesegang's rings. Finally the whole mass gradually hardens with loss of water and crystallization of much of the silica as quartz or chalcedony. During the process of crystallization the coloured bands are not disturbed and hence we have the final agate as it is now found.

Agates are cut and polished chiefly in the Idar-Oberstein district situated on the Nahe, a tributary of the Rhine at Bingen. Here the industry grew up many centuries ago by reason of an abundance of agates in the amygdaloidal melaphyre of the district. The stones used now are mostly imported from Brazil (Rio Grande do Sul) and from Uruguay.

Most commercial agate is artificially stained so that stones naturally unattractive by their dull grey tints come to be valuable for ornamental purposes. The colouring matter is absorbed by the porosity of the stone, but different stones and different layers of the same stone exhibit great variation in absorptive power. To produce a dark brown or black colour, the stone is kept perhaps for two or three weeks in a saccharine solution, or in olive oil at a moderate temperature. After removal from the solution, the agate is well washed and then digested for a short time in sulphuric acid, which, entering the pores, carbonizes the absorbed sugar or oil. Certain layers of chalcedony are practically impermeable and these consequently remain uncoloured, so that an alternation of dark and white bands is obtained, giving rise to an onyx. Agate is stained red, to imitate cornelian and sardonyx, by means of ferric oxide. Other colours are detained in other ways.

Among the uses to which agate is applied may be mentioned the formation of knife-edges of delicate balances, small mortars and pestles for chemical work, burnishers and writing styles, umbrella handles, paper knives, seals, brooches and other ornaments. Real cameos are cut from banded agates, one layer forming the medallion, the other the design in relief.

Agates are found in England in the Cheviot Hills, in the neighbourhood of Bristol and at Lichfield in Staffordshire. In Scotland they occur at Montrose in Forfarshire, in Perthshire, and at many other localities. The majority of agates are produced in countries outside Europe, notably in South America, North America and India; they are also found in South Africa and Australia.

Kunz, *Gems and Precious Stones of North America* (1890). For Scottish agates *see* M. F. Heddle, *Mineralogy of Scotland* (1901).

(W. A. W.)

**AGATHA, ST.,** the patron saint of Catania, Sicily, where her festival is celebrated on Feb. 5. The legend is that she was a native of Sicily (probably of Catania, though Palermo also claims her) of noble birth and great beauty. She repelled the advances of the Roman prefect sent by the emperor Decius to govern Sicily, and was by his orders brutally tortured and finally sent to the stake. As soon as the fire was lighted an earthquake occurred and the people insisted on her release. She died in prison on Feb. 5, 251. The rescue of Catania from fire during an eruption of Mt. Etna was later attributed to St. Agatha's veil.

**AGATHANGELUS, AGATHANGE** or **AKATHANKELOS,** Armenian historian, lived during the 4th century, and wrote a *History of the Reign of Dertad, or Tiridates, and of the Preaching of St. Gregory the Illuminator.* This history was translated into several languages, and Greek and Latin translations are found in the *Acta Sanctorum Bollandistarum,* tome viii. The history consists of three parts, a history of St. Gregory and his companions, the doctrine of Gregory, and the conversion of Armenia to Christianity.

*See* V. Langlois, *Collection des Historiens anciens et modernes de l'Arménie* (Paris, 1868).

**AGATHARCHIDES** or **AGATHARCHUS,** of Cnidus, Greek historian and geographer, lived in the time of Ptolemy Philometor (181–146 B.C.) and his successors. Amongst other works, he wrote treatises on *Asia, Europe* and *the Red Sea.* Interesting extracts from the last, of some length, are preserved in Photius (cod. 213).

BIBLIOGRAPHY.—*See* H. Leopoldi, *De Agatharchide Cnidio Dissertatio* (1892); C. W. Müller, *Fragmenta Historicorum Graecorum,* iii., and *Geographi Graeci Minores,* i.; E. H. Bunbury, *Hist. of Ancient Geography,* ii. (1879).

**AGATHARCHUS,** the name of an Athenian painter of the 5th century B.C. He is said by Vitruvius to have been the first to paint a scene for the acting of tragedies.

**AGATHIAS** (*c.* A.D. 536–582), of Myrina in Aeolis, Greek poet and historian. He studied law at Alexandria, completed his training at Constantinople and practised as an advocate (*scholasticus*) in the courts. He wrote a number of short love-poems in epic metre, called *Daphniaca.* He next put together a kind of anthology, containing epigrams by earlier and contemporary poets and himself, under the title of a *Cycle of New Epigrams.* About a hundred epigrams by Agathias have been preserved in the *Greek Anthology.* After the death of Justinian (565), some of Agathias's friends persuaded him to write the history of his own times. This work, in five books, begins where Procopius ends, and is the chief authority for the period 552–558.

BIBLIOGRAPHY.—Editio princeps, by B. Vulcanius (1594); in the Bonn *Corpus Scriptorum Byz. Hist.,* by B. G. Niebuhr (1828); in Migne, *Patrologia Graeca,* lxxxviii; L. Dindorf, *Historici Graeci Minores* (1871); W. S. Teuffel, "Agathias von Myrine," in *Philologus* (i. 1846); C. Krumbacher, *Geschichte der byzantinischen Litteratur* (2nd ed. 1897).

**AGATHO,** pope from 678 to 681, was born in Sicily. He ordered St. Wilfrid to be restored to his bishopric at York in 679, and was the first pope to cease payment of the tribute hitherto paid on election to the emperor at Constantinople. Agatho died on Jan. 10, 681.

**AGATHOCLES** (361–289 B.C.), tyrant of Syracuse, was the son of a potter, born at Thermae Himeraeae (mod. *Termini Imerese*) in Sicily. He removed to Syracuse and served with distinction in the army In 333 B.C. he married the widow of his patron Damas, a distinguished and wealthy citizen. He was twice banished for attempting to overthrow the oligarchical party in Syracuse (*q.v.*); in 317 B.C. he returned with an army of exiles and Campanian mercenaries. He banished or murdered some 10,000 members of the senate and the oligarchical party, proclaiming himself the champion of the people, and thus made himself master of Syracuse. His tyranny was confirmed by a virtually unanimous vote of the people, and, despite his continuous wars, he seems to have been generally popular. He enriched Syracuse with many public buildings, and his reign was looked back to as a period of orderliness and tranquillity. His foreign policy was inevitably part of the almost continuous 200 years' war between the Sicilian Greeks and their secular enemy, Carthage (*q.v.*). In these wars Syracuse had always taken the lead, and Agathocles only continued the policy of Dionysius the Elder, Dionysius the Younger and Timoleon (*qq.v.*).

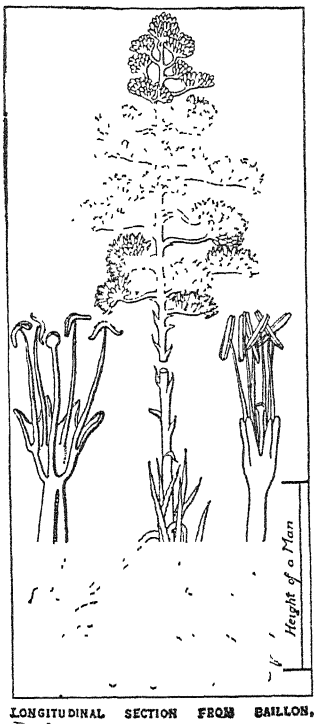
In 310 B.C. Agathocles, defeated and besieged in Syracuse, took the desperate resolve of breaking through the blockade and attacking the enemy in Africa. He besieged Carthage, which was at the time troubled by internal dissensions, but after several victories he was at last completely defeated (306) and fled secretly to Sicily. After concluding peace with Carthage, Agathocles styled himself king of Sicily and established his rule over the Greek cities of the island more firmly than ever. Even in his old age he displayed the same energy and is said to have been meditating a fresh attack on Carthage at the time of his death, which was followed by a recrudescence of Carthaginian power in Sicily. Agathocles was something more than the typical leader of mercenaries. He was a born leader, who knew how to inspire devotion.

BIBLIOGRAPHY.—*See* Justin xxii., xxiii; Diodorus Siculus xix., xxi., xxii. (follows generally Timaeus who had a special grudge against Agathocles); Polybius ix. 23; Schubert, *Geschichte des Agathokles* (1887); Grote, *History of Greece,* ch. 97; also SICILY: *History.*

**AGATHODAEMON,** an early map designer of Alexandria, who probably lived in the 2nd century A.D. Some manuscripts of the *Geography* of Ptolemy contain 27 maps, which are stated to have been drawn by Agathodaemon of Alexandria, who "delineated the whole world according to the eight books of Ptolemy's geography." About 1470, Nicolaus Doris, a Benedictine monk, produced an edition of them in which the names were inserted in Latin instead of Greek.

*See* Bunbury, *History of Ancient Geography,* ii.

**AGATHODAEMON,** an important god in Greek mythology, the "good spirit" of cornfields and vineyards, protective spirit of individuals and the State. The Greeks drank a cup of pure wine in his honour at the end of each meal (Aristophanes, *Equites,* 106). Often accompanied by *Agathē Tuchē* (good fortune), he may be identified with the Roman *Bonus Eventus* (Pliny, *Nat. Hist.,* xxxvi., 23) and *Genius* (q.v.). He is represented in works of art in the form of a serpent, or of a young man with a horn of plenty and a bowl in one hand, and a poppy and ears of corn in the other.



**AGATHON** (*c.* 448–400 B.C.), Athenian tragic poet, friend of Euripides and Plato. He won his first victory in 416 (at the Lenaea), and his plays seem to have been successful, despite their artificial style. He appears to have been the first to invent an original plot, and to write choral odes unconnected with the plot. His effeminacy made him a butt of Aristophanes. Before 406 he retired to the court of Archelaus, where he died.

*See* Aristotle, *Poetica* 9, and 18: Aristophanes, *Thesmoph.* 59, 106, *Eccles.* 100; Plato, *Symp.* 198 c.; Plutarch, *Symp.* 3; Aelian, *Var. Hist.* xiv. 13; Ritsch, *Opuscula,* i.; fragments in Nauck, *Tragicorum Graecorum Fragmenta. See* also Haigh, *Tragic Drama of the Greeks.*

**AGATHYRSI,** a people of Thracian origin, who in the earliest historical times occupied the plain of the Maris (Maros), in the region now known as Transylvania. They are described by Herodotus (iv. 104) as of luxurious habits, wearing gold ornaments (the district is still auriferous) and having wives in common. They tattooed their bodies (Virgil, *Aeneid,* iv. 136), degrees of rank being indicated by the manner in which this was done, and coloured their hair dark blue. Valerius Flaccus (*Argonautica,* vi. 135) calls them Thyrsagetae, probably in reference to their celebration of orgiastic rites in honour of some divinity akin to the Thracian Dionysus. In later times the Agathyrsi were driven farther north, and their name was unknown to the Romans in their original home.

*See* Pliny, *Nat. Hist.* iv. 12 [26], 88.

**AGAVE,** a large botanical genus of the family Amaryllidaceae, chiefly Mexican, but occurring also in the southern and western United States and in central and tropical South America. The plants have a large rosette of thick fleshy leaves generally ending in a sharp point and with a spiny margin; the stout stem is usually short, the leaves apparently springing from the root. They grow slowly and flower but once after a number of years, when a tall stem or "mast" grows from the centre of the leaf-rosette and bears a large number of short, tubular flowers. After development of fruit the plant dies down, but suckers are frequently produced from the base of the stem which become new plants. The most familiar species is *Agave americana* (*see* fig.), a native of tropical America, the so-called century plant or American aloe (the Maguey of Mexico). The number of years before flowering, 5 to 60 or more, but usually about 10, depends on the vigour of the individual, the richness of the soil and the climate; during these years the plant is storing in its fleshy leaves the nourishment required for the effort of flowering. During the very rapid development of the immense peduncle, or flowering stalk, there is a rush of sap to the base of the young flower stalk; by removing this large bud just as it is ready to emerge and by scooping out a cavity in the heart of the plant, a large quantity of sweet sap is obtained; and this *aguamiel,* removed, carried in pigskin bottles to the central repository, undergoes two kinds of fermentation, and when it has become thick, milky and more or less ropy (the sugars then being changed into alcohol) it is marketed as *pulque* (*q.v.*), the national drink of Mexico; notwithstanding its objectionable odor and consistency it is by some thought a wholesome and nourishing drink, and many train-loads are brought daily to Mexico City from the vast *pulque* plantations in the surrounding region. By distillation of *pulque fuerte,* or completely fermented juice, a very strong liquor, *mescal,* is obtained.

LONGITUDINAL SECTION FROM BAILLON, "HISTOIRE DES PLANTES"

CENTURY PLANT (A. AMERICANA), SO NAMED BECAUSE IT WAS SUPPOSED TO BLOSSOM ONLY WHEN 100 YEARS OLD AND THEN DIE

Showing long flower stem and rosette of spiny leaves; vertical section and single flower enlarged

The leaves of several species yield commercial fibres: *A. rigida elongata* or *A. fourcroydes* is the henequen, or Yucatan sisal, formerly the principal sisal fibre (*q.v.*) *Agave sisalana* is the Bahama sisal, the cultivation of which is expanding greatly in East Africa and Haiti.

*A. cantula* is the Maguey, or Philippine sisal.

*A. zapupe* is the Mexican *Zapupe* fibre.

*A. americana* produces one of the *Pita* fibres, now grown in southern Europe and parts of the West Indies as well as in Mexico.

*A. neglecta* is the Florida sisal, one of the largest species, the flower-stalk of which may exceed 42 feet in height.

The firm white pith of the interior of the flowering stem of any of these species, when dried and cut in slices has a variety of uses—as natural razor-strops, as lining of insect-boxes, insulating material, etc. The gummy, soapy juice expressed from the leaves will lather like soap and may be used as a detergent where alkali would be injurious. The thick reddish roots of various species are reputed to have medicinal properties. The concentrated sap exuded into the scooped-out central bud cavity is also used as a medicine and is a source of agavose ($C_{12}H_{22}O_{11}$), one of the rare sugars. In the Madras Presidency the plant is widely used for hedges along railroads. *Agave americana* was introduced into Europe about the middle of the 16th century and is now extensively cultivated for its handsome appearance; in the variegated forms the leaf has a white or yellow marginal or central stripe from base to apex. As the leaves unfold from the centre of the rosette the impression of the marginal spines is very conspicuous on the still erect younger leaves.

**AGDE,** a town of south France, in the department of Hérault, 2½m. from the mouth of the Hérault, and 32m. S.W. of Montpellier on the Southern railway. Pop. (1936), 8,546. It lies at the foot of an extinct volcano, the Montagne St. Loup, and is surnamed "La Ville Noire" from the dark volcanic basalt of which it is built. Agde is said to have been founded as a port by Phocaeans under the name of *Agathe* It was the seat of a bishop from 400 to 1790. Overlooking the river is the old Cathedral of St. Étienne, a grim fortress-like structure of the 12th century. The machicolations of the parapet are said to be the oldest existing instance of the kind. The *Canal du Midi,* uniting the Garonne with the Mediterranean, passes under the town walls. The maritime commerce of the town has declined, because Cette is near and the Hérault shallow, but the fishing industry is still alive. The town has a tribunal of commerce.

SYNOD OF AGDE (*Concilium Agathense*).—The 47 genuine canons of the synod (Sept. 11, 506), dealt with discipline, church life, alienation of ecclesiastical property and treatment of Jews. While favouring sacerdotal celibacy the council laid rather rigid restrictions on monasticism. It commanded that the laity communicate at Christmas, Easter and Whitsuntide. The canons of Agde are based in part on earlier Gallic, African and Spanish legislation; and some of them were re-enacted by later councils.

**AGE.** The subject of the duration of human and animal life does not fall within the scope of this article, and the reader is referred to LONGEVITY. But the word "age" has been used by physiologists to express certain natural divisions in human development and decay. These are usually regarded as numbering five, viz., *infancy,* lasting to the seventh year; *childhood* to the 14th; *youth* to the 21st; *adult life* till 50; and *old age.*
